

GORDIAN[®]

Job Order Contract Technical Specifications

CSI Divisions 01-43 December 2024

**University of California Davis, Health
General Building**

This Page Intentionally Left Blank

01 General Requirements

01 00 00 00	GENERAL REQUIREMENTS
01 00 00 00a	INFORMATION & PROCEDURES INSTRUCTIONS (RFI)
01 00 00 00b	PROJECT COORDINATION
01 00 00 00c	UNIVERSITY PROJECT PROCEDURES
01 00 00 00d	DEMOLITION, CUTTING AND PATCHING
01 00 00 00e	REGULATORY REQUIREMENTS
01 00 00 00f	ABBREVIATIONS, SYMBOLS AND DEFINITIONS
01 00 00 00g	PROJECT MEETINGS
01 10 00 00	INFECTION CONTROL
01 10 00 00a	UNIVERSITY OCCUPANCY AND WORKING HOURS
01 11 00 00	SUMMARY OF WORK
01 11 00 00a	UNIVERSITY INTERIM LIFE SAFETY
01 11 00 00b	CAMPUS DESIGN GUIDELINES
01 22 16 00	No Specification Required
01 40 00 00	QUALITY CONTROL
01 40 00 00a	INSPECTION OF WORK
01 42 13 00	Abbreviations and Acronyms
01 42 19 00	References
01 50 00 00	TEMPORARY FACILITIES AND UTILITIES
01 51 13 00	Electrical Renovation
01 52 13 00	Temporary Facilities and Controls
01 52 19 00	CONSTRUCTION WASTE MANAGEMENT
01 54 23 00	Temporary Scaffolding and Platforms
01 56 00 00	TEMPORARY BARRIERS, ENCLOSURES and CONTROLS
01 56 10 00	AIRBORNE CONTAMINANTS CONTROL
01 56 10 00a	ICRA PERMIT FORMS
01 56 10 00b	ICRA PERMIT EXTENSION REQUEST
01 56 20 00	REQUIREMENTS FOR CEILING ACCESS TO SPACES CONTAINING ASBESTOS
01 56 26 00	Erosion and Sedimentation Controls
01 66 00 00	MATERIAL AND EQUIPMENT
01 66 00 00a	PRODUCT OPTIONS AND SUBSTITUTIONS
01 70 00 00	PROJECT CLOSEOUT
01 71 23 16	Cutting and Patching
01 74 00 00	CLEAN-UP AND DISPOSAL
01 74 00 00a	GUARANTEES, WARRANTIES, BONDS SERVICE AND MAINTENANCE
01 74 19 00	Construction Waste Management and Disposal

02 Existing Conditions

02 32 13 00	Subsurface Drilling and Sampling
02 41 13 13	Portland Cement Concrete Removal
02 41 13 13a	Selective Demolition
02 41 16 13	Building Demolition
02 58 13 00	Snow And Other Temporary Fencing
02 61 00 00	Excavation And Handling Of Contaminated Material
02 61 13 00	Precision Testing Of Underground Fuel Oil Tanks
02 61 13 00a	Hydrostatic Pressure Testing Of Air Receiving Tanks
02 61 26 00	Removal and Disposal of Contaminated Soils
02 65 00 00	Underground Storage Tank Removal
02 82 00 00	ASBESTOS ABATEMENT AND IN-PLACE MANAGEMENT
02 82 16 00	Engineering Control of Asbestos Containing Materials
02 82 33 00	Removal and Disposal of Asbestos Containing Materials
02 82 33 00a	Removal Of Nonfriable Asbestos-Containing Materials
02 83 19 13	Lead Remediation
02 83 19 13a	Lead-Based Paint Remediation
02 83 19 13b	XRF Testing For Lead-Based Paint
02 83 19 13c	Lead Dust Wipe, Air And Tcpl Sampling And Analysis
02 84 16 00	Handling of Lighting Ballasts and Lamps Containing PCBs and Mercury
02 84 16 00a	Interior Lighting
02 84 16 00b	Exterior Lighting
02 84 33 00	Overhead Electrical Distribution
02 87 13 33	Mold Remediation
02 87 16 13	Excrement Removal

Table of Contents

03 Concrete

03 01 30 71	Maintenance of Cast-in-Place Concrete
03 01 30 71a	Self-Adhering Sheet Waterproofing
03 05 13 00	Architectural Concrete
03 11 16 13	Rusticated Concrete Finishes
03 30 00 00	Cast-In-Place Concrete
03 30 53 00	Miscellaneous Cast-In-Place Concrete
03 31 13 00	Portland Cement Concrete Overlays
03 31 13 00a	Steel Reinforced Portland Cement Concrete Overlays
03 31 13 00b	Fiber Reinforced Portland Cement Concrete Overlays
03 31 13 00c	Roller Compacted Concrete Pavement
03 35 23 00	Exposed Aggregate Concrete Finishing
03 37 13 00	Shotcrete
03 37 13 00a	Glass-Fiber-Reinforced Concrete (GFRC)
03 41 16 00	Precast Structural Concrete
03 41 16 00a	Precast Concrete Slabs
03 41 23 00	Precast Architectural Concrete
03 41 26 00	Unbonded Post-Tensioned Concrete
03 51 13 00	Cementitious Wood Fiber Decks
03 51 16 00	Gypsum Concrete Roof Decks
03 51 16 00a	Gypsum Plank Decking
03 53 14 00	Concrete Topping
03 54 16 00	Hydraulic Cement Underlayment

04 Masonry

04 01 20 51	Masonry Cleaning
04 05 23 16	Sheet Metal Flashing And Trim
04 20 00 00	Unit Masonry
04 23 13 00	Glass Unit Masonry
04 41 00 00	Exterior Stone Cladding
04 41 00 00a	Stone Masonry
04 41 00 00b	Stone Wall Facing

05 Metals

05 05 21 00	Structural Steel Framing
05 12 23 00	Cold-Formed Metal Framing
05 14 13 00	Architecturally-Exposed Structural Aluminum Framing
05 15 16 00	Decorative Metal
05 21 19 00	Steel Joist Framing
05 31 13 00	Steel Decking
05 50 00 00	Metal Fabrications
05 51 13 00	Metal Pan Stairs
05 51 13 00a	Fabricated Metal Spiral Stairs
05 52 13 00	Pipe And Tube Railings
05 53 13 00	Bar Gratings
05 73 23 00	Miscellaneous Ornamental Metals
05 73 23 00a	Decorative Metal Railings
05 75 00 00	Decorative Formed Metal

06 Wood, Plastics, and Composites

06 01 20 91	Maintenance of Finish Carpentry
06 01 40 91	Door Hardware
06 05 23 00	Timber Bridge Components

06 05 23 00a	Heavy Timber Construction
06 10 00 00	Rough Carpentry
06 10 00 00a	Miscellaneous Rough Carpentry
06 11 13 00	Maintenance of Rough Carpentry
06 15 13 00	Exterior Rough Carpentry
06 15 13 00a	Wood Floor Decking
06 16 23 00	Sheathing
06 17 13 00	Glued-Laminated Construction
06 17 33 00	Metal-Plate-Connected Wood Trusses
06 22 13 00	Exterior Finish Carpentry
06 22 13 00a	Interior Finish Carpentry
06 25 16 00	Wood Paneling
06 41 13 00	Interior Architectural Woodwork
06 41 13 00a	Wood-Veneer-Faced Architectural Cabinets
06 42 19 00	Plastic Paneling
06 46 29 00	Exterior Architectural Woodwork
06 51 13 00	Structural Plastics
06 51 13 00a	Plastic Lumber
06 51 13 00b	Composite Lumber
06 74 13 00	Fiberglass Reinforced Gratings
06 82 00 00	Pultruded Fiberglass Structural Shapes

07 Thermal And Moisture Protection

07 01 50 81	Membrane Reroofing Preparation
07 01 50 81a	Built-Up Coal Tar Roofing
07 11 13 00	Bituminous Dampproofing
07 13 13 00	Bituminous Sheet Waterproofing
07 13 53 00	Elastomeric Sheet Waterproofing
07 14 13 00	Hot Fluid-Applied Rubberized Asphalt Waterproofing
07 14 16 00	Cold Fluid-Applied Waterproofing
07 16 13 00	Polymer Modified Cement Waterproofing
07 16 16 00	Crystalline Waterproofing
07 16 19 00	Metal Oxide Waterproofing
07 17 13 00	Bentonite Waterproofing
07 19 13 00	Water Repellents
07 21 13 13	Modified Bitumous Protected Membrane Roofing
07 21 16 00	Thermal Insulation
07 24 13 00	Polymer-Based Exterior Insulation And Finish System (EIFS)
07 24 13 00a	Water-Drainage Exterior Insulation And Finish System (EIFS)
07 31 13 13	Asphalt Shingles
07 31 16 00	Metal Shingles
07 31 26 00	Slate Shingles
07 31 29 00	Wood Shingles And Shakes
07 31 33 00	Composite Rubber Shingles
07 32 13 00	Clay Roof Tiles
07 32 16 00	Concrete Roof Tiles
07 41 13 00	Metal Roof Panels
07 41 13 00a	Sheet Metal Roofing
07 42 13 19	Glazing
07 42 93 00	Siding
07 46 16 00	Metal Plate Wall Panels
07 46 16 00a	Aluminum Siding
07 46 63 00	Insulated-Core Metal Wall Panels
07 51 13 00	Built-Up Asphalt Roofing
07 52 13 00	APP-Modified Bituminous Membrane Roofing
07 52 16 00	SBS-Modified Bituminous Membrane Roofing
07 53 16 00	Chlorosulfonate-Polyethylene (CSPE) Roofing
07 53 23 00	Ethylene-Propylene-Diene-Monomer (EPDM) Roofing
07 54 19 00	Polyvinyl-Chloride (PVC) Roofing
07 54 23 00	Thermoplastic-Polyolefin (TPO) Roofing
07 56 00 00	Liquid Applied Cool Roof System
07 56 00 00a	Coated Foamed Roofing
07 63 00 00	Common Work Results for Fire Suppression
07 63 00 00a	Common Work Results for Plumbing
07 63 00 00b	Common Work Results for HVAC
07 71 23 00	Roof Specialties
07 72 23 00	Roof Accessories

Table of Contents

07 72 56 00	Heat Tracing for Fire-Suppression Piping
07 81 16 00	Sprayed Fire-Resistive Materials
07 84 13 16	Firestopping
07 84 13 16a	Penetration Firestopping
07 84 43 00	Joint Firestopping
07 84 56 13	Board Fire Protection
07 91 23 00	Joint Sealants
07 95 13 13	Interior Expansion Joint Cover Assemblies
07 95 13 16	Manufactured Roof Expansion Joints

08 Openings

08 01 11 61	Steel Doors And Frames
08 01 52 61	Wood Windows
08 11 63 13	Steel Storm Doors
08 11 63 23	Aluminum Storm Doors
08 11 73 00	Sliding Metal Fire Doors
08 12 13 13	Stainless-Steel Doors and Frames
08 13 13 53	Steel Entry Doors
08 14 00 00	Wood Doors
08 14 16 00	Flush Wood Doors
08 14 16 00a	Stile And Rail Wood Doors
08 16 13 00	Fiberglass Reinforced Plastic (FRP) Doors and Frames
08 18 16 00	Sliding Aluminum-Framed Glass Doors
08 18 16 00a	Sliding Wood-Framed Glass Doors
08 31 13 00	Access Doors And Frames
08 33 23 11	Overhead Coiling Doors
08 33 26 00	Overhead Coiling Grilles
08 33 36 00	Side Coiling Grilles
08 34 49 13	Radiation Protection
08 34 53 00	Detention Doors And Frames
08 34 73 00	Sound Control Doors
08 35 13 13	Folding Doors
08 36 13 00	Sectional Doors
08 38 13 00	Flexible Doors
08 42 13 00	Aluminum-Framed Entrances And Storefronts
08 42 26 00	All-Glass Entrances And Storefronts
08 42 29 23	Intensive Care Unit_Critical Care Unit (ICU_CCU) Entrances
08 42 33 00	Revolving Door Entrances
08 44 13 00	Glazed Aluminum Curtain Walls
08 44 13 00a	Structural-Sealant-Glazed Curtain Walls
08 44 13 00b	Sloped Glazing Assemblies
08 45 23 00	Structured-Polycarbonate-Panel Assemblies
08 45 23 00a	Fiberglass-Sandwich-Panel Assemblies
08 45 23 00b	Unit Skylights
08 45 23 00c	Metal-Framed Skylights
08 51 13 00	Aluminum Windows
08 51 13 00a	Aluminum Replacement Windows
08 51 23 00	Steel Windows
08 51 69 00	Security Window Screens and Doors
08 51 69 00a	Aluminum Storm Windows
08 53 13 00	Vinyl Windows
08 56 19 00	Security Windows
08 56 56 00	Security Grilles
08 62 00 00	Roof Windows
08 71 11 00	Detention Door Hardware
08 71 13 00	Power Door Operators
08 83 13 00	Mirrors
08 84 00 00	Plastic Glazing
08 87 23 16	Fragment Retention Film For Glass
08 88 53 00	Security Glazing
08 90 00 00	Louvers And Vents

09 Finishes

09 22 13 13	Gypsum Plastering
09 22 13 13a	Cement Plastering
09 22 13 13b	Gypsum Veneer Plastering
09 22 16 13	Non-Structural Metal Framing
09 22 36 23	Lath and Plaster Renovation
09 23 13 00	Gypsum Board Renovation
09 28 13 00	Gypsum Board
09 29 82 00	Gypsum Board Shaft-Wall Assemblies
09 30 13 00	Ceramic Tiling
09 51 13 00	Acoustical Panel Ceilings
09 51 23 00	Acoustical Tile Ceilings
09 54 23 00	Acoustical Metal Pan Ceilings
09 54 23 00a	Linear Metal Ceilings
09 63 13 00	Brick Flooring
09 64 13 00	Wood Flooring
09 64 66 00	Wood Athletic Flooring
09 65 13 13	Cork Flooring
09 65 13 13a	Resilient Base and Accessories
09 65 13 33	Linoleum Flooring
09 65 16 23	Resilient Sheet Flooring
09 65 19 19	Resilient Tile Flooring
09 65 66 00	Resilient Athletic Flooring
09 65 66 00a	Interlocking Resilient Flooring
09 65 66 00b	Fluid-Applied Athletic Flooring
09 66 13 00	Portland Cement Terrazzo Flooring
09 66 23 00	Resinous Matrix Terrazzo Flooring
09 67 23 00	Resinous Flooring
09 68 13 00	Tile Carpeting
09 68 16 00	Sheet Carpeting
09 69 13 00	Access Flooring
09 72 13 00	Wall Coverings
09 84 13 00	Acoustical Wall Panels
09 91 13 00	Exterior Painting
09 91 13 00a	Staining and Transparent Finishing
09 91 13 00b	High-Temperature-Resistant Coatings
09 91 23 00	Interior Painting
09 91 23 00a	Multicolor Interior Finishing
09 93 23 13	Floor Treatment Refinishing Wood Floors
09 96 00 00	High-Performance Coatings
09 96 56 00	Fiberglass Reinforced Epoxy Coating
09 96 66 00	Cementitious Coatings

10 Specialties

10 11 13 13	Visual Display Units
10 12 00 00	Display Cases
10 14 00 00	Signage
10 14 23 11	Vitrified Brick Pavement Replacement
10 14 53 11	Traffic Signs
10 21 13 13	Metal Toilet Compartments
10 21 13 19	Plastic Toilet Compartments
10 21 16 17	Shower and Dressing Compartments
10 21 23 13	Cubicle Curtains and Track
10 22 13 00	Wire Mesh Partitions
10 22 19 13	Demountable Partitions
10 22 33 00	Accordion Folding Partitions
10 22 43 00	Operable Panel Partitions
10 26 23 13	Impact-Resistant Wall Protection
10 28 13 13	Toilet, Bath, and Laundry Accessories
10 28 13 13a	Detention Toilet Accessories
10 28 16 13	Bath Accessories
10 44 13 00	Fire Protection Cabinets
10 44 16 13	Fire Extinguishers
10 51 13 00	Metal Lockers
10 51 26 00	Plastic-Laminate-Clad Lockers

Table of Contents

10 55 23 23	USPS-Delivery Postal Specialties
10 56 13 16	Metal Storage Shelving
10 71 13 13	Exterior Shutters
10 73 13 13	Awnings
10 73 26 13	Extruded Aluminum Walkway Cover
10 75 16 00	Ground-Set Flagpoles
10 81 13 00	Oriented Flexible Netting Bird Barrier

11 Equipment

11 12 16 00	Parking Control Equipment
11 13 13 00	Loading Dock Equipment
11 14 13 19	Turnstiles
11 21 63 00	Foodservice Equipment
11 30 13 13	Residential Appliances
11 30 13 13a	Refrigerators
11 30 13 13b	Gas Ranges
11 30 13 13c	Electric Ranges
11 30 13 13d	Range Hoods
11 32 13 00	Unit Kitchens
11 41 33 00	Residential Casework
11 52 13 13	Projection Screens
11 53 13 11	Laboratory Fume Hoods
11 66 13 00	Playground Equipment And Structures
11 66 23 13	Gymnasium Equipment
11 66 53 11	Gymnasium Dividers
11 82 19 00	Packaged Incinerators
11 82 26 00	Facility Waste Compactors

12 Furnishings

12 01 60 00	Fixed Audience Seating
12 21 13 13	Horizontal Louver Blinds
12 21 16 13	Vertical Louver Blinds
12 22 13 00	Curtains and Drapes
12 24 13 00	Roller Window Shades
12 24 13 00a	Pleated Window Shades
12 31 16 00	Kitchen Casework, Stainless Steel Cabinets
12 31 16 00a	Stone Countertops
12 36 61 16	Solid Polymer Fabrications
12 48 13 13	Entrance Floor Mats and Frames
12 48 13 13a	Entrance Floor Grilles
12 56 53 00	Laboratory Casework
12 59 16 00	Systems Furniture
12 62 23 00	Portable Bleachers
12 66 13 00	Telescoping Stands

13 Special Construction

13 34 16 13	Grandstands And Bleachers
13 34 16 13a	Fixed Wood Bleachers (Exterior)
13 34 16 13b	Demountable Bleachers (Exterior)
13 34 19 00	Metal Building Systems
13 34 23 16	Fabricated Control Booths
13 46 13 00	Lightning Protection
13 47 13 13	Cathodic Protection

14 Conveying Equipment

14 01 30 71	Electric Traction Elevators
14 01 30 71a	Hydraulic Elevators
14 31 00 00	Escalators
14 32 00 00	Moving Walks
14 41 19 00	Wheelchair Lifts
14 91 82 00	Trash Chutes
14 92 00 00	Pneumatic Tube System

21 Fire Suppression

21 05 13 00	Common Motor Requirements for Fire Suppression Equipment
21 05 23 00	Piped Utilities Basic Materials And Methods
21 05 48 13	Vibration And Seismic Controls For Fire-Suppression Piping And Equipment
21 07 00 00	Fire-Suppression Systems Insulation
21 11 19 00	Fire-Suppression Standpipes
21 13 13 00	Wet-Pipe Fire-Suppression Sprinklers
21 13 16 00	Dry-Pipe Fire-Suppression Sprinklers
21 13 39 00	Foam-Water Systems
21 22 16 00	Clean-Agent Fire-Extinguishing Systems
21 24 00 00	Fiberglass Reinforced Polyester (FRP) Flush Doors
21 31 13 00	Electric-Drive, Centrifugal Fire Pumps
21 31 16 00	Diesel-Drive, Centrifugal Fire Pumps
21 34 13 00	Pressure-Maintenance Pumps

22 Plumbing

22 00 00 00	PLUMBING
22 05 13 00	Common Motor Requirements for Plumbing Equipment
22 05 16 00	Expansion Fittings and Loops for Plumbing Piping
22 05 19 00	Meters and Gages for Plumbing Piping
22 05 23 00	Architecturally Exposed Structural Steel Framing
22 05 23 00a	General-Duty Valves for Plumbing Piping
22 05 33 00	Heat Tracing for Plumbing Piping
22 05 48 13	Vibration And Seismic Controls For Plumbing Piping And Equipment
22 05 53 00	Identification for Plumbing Piping and Equipment
22 05 76 00	Storm Drainage Piping Specialties
22 07 19 00	Plumbing Insulation
22 11 16 00	Domestic Water Piping
22 11 16 00a	Storm Drainage Piping
22 11 16 00b	General-Service Compressed-Air Piping
22 11 16 00c	Compressed-Air Piping For Laboratory And Healthcare Facilities
22 11 16 00d	Vacuum Piping For Laboratory And Healthcare Facilities
22 11 16 00e	Gas Piping For Laboratory And Healthcare Facilities
22 11 16 00f	Steam And Condensate Piping
22 11 16 00g	Refrigerant Piping
22 11 23 13	Water Distribution Pumps
22 11 23 13a	Domestic-Water Packaged Booster Pumps
22 11 23 23	Water Supply Wells
22 12 19 00	Facility Ground-Mounted, Potable-Water Storage Tanks
22 12 19 00a	Facility Aboveground Fuel-Oil Storage Tanks
22 12 23 26	Facility Fuel-Oil Piping
22 13 16 00	Sanitary Waste And Vent Piping
22 13 19 26	Sanitary Waste Piping Specialties
22 13 29 13	Sanitary Sewerage Pumps
22 13 29 13a	Lift Station
22 13 29 13b	Facility Packaged Sewage Pumping Stations
22 14 29 13	Sump Pumps
22 15 19 13	General-Service Packaged Air Compressors and Receivers
22 31 16 00	Domestic Water Softeners
22 33 00 00	Electric, Domestic-Water Heaters
22 34 00 00	Fuel-Fired, Domestic-Water Heaters

Table of Contents

22 35 23 13 Domestic-Water Heat Exchangers
 22 40 00 00 Plumbing Fixtures
 22 42 19 00 Tub and Shower Enclosures
 22 43 00 00 Healthcare Plumbing Fixtures
 22 45 00 00 Emergency Plumbing Fixtures
 22 47 13 00 Drinking Fountains And Water Coolers

SECTION 01 00 00 00 - GENERAL REQUIREMENTS

PART 1 GENERAL

1.01 GENERAL INSTALLATION PROVISIONS

- A. Inspection of Conditions: Inspect substrates to receive work and conditions under which the work is to be performed. Report unsatisfactory conditions, in writing, to the University's Representative. Do not proceed with the work until unsatisfactory conditions have been corrected.
- B. Manufacturer's Instructions: Where installations include manufactured products, comply with the manufacturer's applicable instructions and recommendations for installation, to the extent that these instructions and recommendations are more explicit or more stringent than requirements are indicated in the Contract Documents.
- C. Provide attachment and connection devices and methods for securing work. Secure work true to line and level, and within recognized industry tolerances. Allow for expansion and building movement. Provide uniform joint width in exposed work. Arrange joints in exposed work to obtain the best visual effect. Refer questionable visual-effect choices to University's Representative for final decision.
- D. Recheck measurements and dimensions of the work, as an integral step of starting each installation.
- E. Install work during weather conditions and project conditions, which will ensure the best possible results in coordination with the work. Isolate unit of work that are incompatible, to prevent deterioration.
- F. Coordinate enclosure of the work with required inspections and tests, so as to minimize the necessity of uncovering work for that purpose.
- G. Ensure there are no obstructions to spaces and installations when required to remain clear, in accordance with applicable code requirements.
- H. Ensure piping, wiring, ducts, or other installations are not enclosed until they have been inspected and approved, and required certificates of inspection have been issued.
- I. Mounting Heights: Mount individual units of work to comply with CAC, Title 24 and ADA requirements. Refer questionable mounting height choices to University's Representative for final decision.
- J. Ensure anchorage, blocking, joining, and other detailing are provided as required.
- K. Remove and replace work, which does not comply with Contract Documents. Repair or replace work or property damaged by construction operations at no increase in Contract Sum.

1.02 SUPERINTENDENT

- A. If requested by University, Contractor shall provide a management organizational chart and a list of personnel comprising the superintendence staff. All references to the Superintendent elsewhere in the Contract Documents shall mean the superintendence staff.
- B. The Superintendent shall be in attendance at the Project site not less than eight hours per day, five days per week, unless the Work is stopped due to a general strike or conditions beyond the control of Contractor or until termination of the Contract in accordance with the Contract Documents. Superintendent shall be acceptable to University and shall continue in that capacity for the duration of the Project, unless Superintendent ceases to be on Contractor's payroll or University otherwise agrees. Contractor or any other entity shall not employ the Superintendent on any other project during the course of the Work.

1.03 SAFETY

- A. Observe University's rules and continuously maintain safety precautions. See EH&S Bulletin at the end of this section.

- B. Keep exits and entrances open and passable.

1.04 PRIVACY

- A. Observe University's Privacy Laws. See AB 211 and SB 541 at the end of this section.

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION

- A. Exhibits: University of California General Safety Update, Safety Instructions for Contractors/Vendors Working at UC.
- B. Exhibits: UC Privacy Laws

Highlights of New Medical Privacy Laws Effective January 1, 2009

	AB 211	SB 541
Key Requirements	Mandates the confidentiality of medical information. Requires implementation of appropriate administrative, technical and physical safeguards to protect the privacy of a patient's medical information, and implementation of reasonable safeguards to prevent unauthorized access, use, or disclosure.	Mandates prevention of unlawful or unauthorized access to or use or disclosure of patient medical information. Reporting obligations: Providers must report incidents of unlawful access, use, or disclosure of a patient's medical information within 5 days of detection of the breach to CDPH and the affected patient(s)/ legal representative.
Authorizes	Fines and civil penalties <u>against any individual</u> that negligently discloses or knowingly and willfully obtains, discloses, or uses medical information in violation of state / federal laws.	Fines to the institution for failure to prevent or report for unauthorized access, use, disclosure of medical information.
Oversight Agency	Calif. Office of Health Information Integrity (Cal-OHII)	Calif. Department of Public Health (CDPH)
Fines & Penalties; Civil/Criminal Actions	Individual fines and penalties: \$2,500 - \$25,000 per violation \$250,000 – maximum penalty per violation Misdemeanor if patient suffers economic loss or personal injury Potential for civil action by patient with statutory damages (\$1000) in addition to actual damages Cal-OHI may notify licensing board for further investigation/ discipline of individual providers.	Institutional fines for failure to prevent or report: \$25,000 – initial violation (per patient) \$17,500 – subsequent occurrence \$250,000 – maximum penalty \$100 per day for late reporting

For more information, see the UC HIPAA Web site.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 00 00 00a - INFORMATION & PROCEDURES INSTRUCTIONS (RFI)

PART 1 GENERAL

1.01 DESCRIPTION

- A. This Section contains the procedures to be followed by Contractor upon discovery of any apparent conflicts, omissions, or errors in the Contract Documents or upon having any question concerning interpretation.

1.02 PROCEDURES

- A. Notification by Contractor:
1. Submit all requests for clarification or additional information in writing to University's Representative using the Request for Information (RFI) form provided by University's Representative or a similar form approved by University's Representative.
 2. Number RFIs sequentially. Follow RFI number with sequential alphabetical suffix as necessary for each resubmission. For example, the first RFI would be "001." The second RFI would be "002." The first resubmittal of RFI "002" would be "002a."
 3. Limit each RFI to one subject.
 4. Submit a RFI if one of the following conditions occurs:
 - a. Contractor discovers an unforeseen condition or circumstance that is not described in the Contract Documents.
 - b. Contractor discovers an apparent conflict or discrepancy between portions of the Contract Documents that appears to be inconsistent or is not reasonably inferred from the intent of the Contract Documents.
 - c. Contractor discovers what appears to be an omission from the Contract Documents that cannot be reasonably inferred from the intent of the Contract Documents.
 5. Contractor shall not:
 - a. Submit an RFI as a request for substitution.
 - b. Submit an RFI as a submittal.
 - c. Submit an RFI under the pretense of a Contract Documents discrepancy or omission without thorough review of the Documents.
 - d. Submit an RFI in a manner that suggests that specific portions of the Contract Documents are assumed to be excluded or by taking an isolated portion of the Contract Documents in part rather than whole.
 - e. Submit an RFI in an untimely manner without proper coordination and scheduling of Work of related trades.
 - f. If Contractor submits an RFI contrary to the above, Contractor shall pay the cost of any review, which cost shall be deducted from the Contract Sum.
 6. Contractor shall submit request for information or clarification immediately upon discovery. Contractor shall submit RFIs within a time frame so as not to delay the Contract Schedule while allowing the full response time described below.
- B. Response Time:
1. University's Representative, whose decision will be final and conclusive, shall resolve such questions and issue instructions to Contractor within a reasonable time frame. In most cases, RFIs will receive a response within 14 days. If in the opinion of University's Representative more than 14 days is required to prepare a response to an RFI, Contractor will be notified in writing.
 2. Should Contractor proceed with the Work affected before receipt of a response from University's Representative, within the response time described above, any portion of the Work which is not done in accordance with University's Representative's interpretations, clarifications, instructions, or decisions is subject to removal or replacement and Contractor shall be responsible for all resultant losses.
 3. Failure to Agree: In the event of failure to agree as to the scope of the Contract requirements,

01 - General Requirements

Contractor shall follow procedures set forth in Article 4 of the General Conditions of the Contract.

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION-NOT USED

END OF SECTION 01 00 00 00a

SECTION 01 00 00 00b - PROJECT COORDINATION

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. This Section specifies administrative and supervisory requirements for Project Coordination.

1.02 DEFINITIONS

- A. The University's Representative is referenced on the Project Directory in the Contract Documents and on the Agreement between the University and the Contractor.

1.03 ADMINISTRATION AND SUPERVISION

- A. Submit a Cost Breakdown within 10-days of Notice to Proceed.
- B. Within 15-days of Notice to Proceed, submit the following:
 - 1. A list of principal staff assignments and consultants with names, addresses and telephone numbers.
 - 2. A list of sub-contractors with emergency telephone numbers.
- C. Contractor's assigned superintendent shall be approved by the University's Representative prior to the start of construction.
- D. Maintain supervision of the Work as referenced in this Section and in the General Conditions.
- E. Do not delegate responsibility for coordination to any subcontractor.
- F. Anticipate the interrelationship of subcontractors so their work is performed in a manner that minimizes interference with general progress of the Work and conforms to the Contract Documents.
- G. Coordinate all portions of the Work in order to fit space available. Before commencing such portions of the Work, prepare Drawings for review by the University's Representative.
- H. Schedule and arrange work to minimize inconvenience and interference to adjacent departments that are in operation during duration of this Project. Notify the University's Representative a minimum of 7 days in advance of work to be performed in adjacent departments.
- I. Resolve differences or disputes between subcontractors concerning coordination, interference, or extent of Work between Specification Sections.
- J. Contact the University's Representative with any questions regarding Project Coordination in sufficient time to provide for any necessary changes in the Work or Schedule.

1.04 INSPECTOR OF RECORD

- A. See Section 01420 - Inspection of Work for responsibilities of the Inspector of Record.

1.05 UNIVERSITY'S REPRESENTATIVE

- A. See Section 01060 - University Project Procedures for responsibilities of the Representative.

1.06 STATE OF CALIFORNIA AGENCIES

- A. See Section 01080 - Regulatory Requirements for OSHPD requirements.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION

3.01 GENERAL COORDINATION

- A. Coordinate substrates to receive work with conditions under which the work is to be performed. Report

01 - General Requirements

unsatisfactory conditions in writing to the University's Representative. Do not proceed with the work until satisfactory conditions have been corrected.

- B. Coordinate work with manufacturer's applicable instructions and recommendations for installation, to the extent that these instructions and recommendations are more explicit or more stringent than requirements are indicated in the Contract Documents.
- C. Ensure attachment and connection devices and methods for securing work. Secure work true to line and level, and within recognized industry tolerances. Allow for expansion and building movement. Provide uniform joint width in exposed work. Arrange joints in exposed work to obtain the best visual effect. Refer questionable visual-effect choices to University's Representative for final decision.
- D. Recheck measurements and dimensions of the work, as an integral step of starting each installation.
- E. Coordinate installation of work during weather conditions and project conditions which will ensure the best possible results in coordination with the work. Isolate units of work when incompatible, to prevent deterioration.
- F. Coordinate enclosure of the work with required inspections and tests, so as to minimize the necessity of uncovering work for that purpose.
- G. Ensure there are no obstructions to spaces and installations when required to remain clear, in accordance with applicable code requirements.
- H. Ensure piping, wiring, ducts, or other installations are not enclosed until they have been inspected and approved, and required certificates of inspection have been issued.
- I. Mount individual units of work to comply with CAC, Title 24 and ADA requirements. Refer questionable mounting height choices to University's Representative for final decision.
- J. Ensure anchorage, blocking, joining, and other detailing are provided as required.
- K. Coordinate removal and replacement of work which does not comply with Contract Documents. Repair or replace work or property damaged by construction operations at no increase in Contract Sum.
- L. Work of the Contract includes coordination of the entire Project from beginning of construction activity through Project close-out and warranty periods.
- M. Comply with applicable requirements of the Mechanical and Electrical specifications for Mechanical and Electrical provisions within units of General Work.
- N. Except as otherwise indicated, final connection of Mechanical Services to General Work is defined as being Mechanical Work, and final connection of Electrical Services to General Work is defined as Electrical Work.
- O. Due to the potential presence of asbestos-containing materials in UCSF buildings, obtain permission from University's Representative prior to opening any access doors, removing ceiling panels, etc.
- P. Coordinate locations of existing pipes, conduits, and ducts that require removal, connection to, relocation or modification so contract work can be completed as per drawings.

3.02 COORDINATION OF FINISHES

- A. In a reasonable time after award of Contract, University's Representative will provide a color schedule designating colors and textures of finish materials, in areas where required.
- B. It is the intent of the Contract Documents to provide harmony in matching finishes throughout the project. Coordinate work of like materials to achieve this result by submitting pilot samples to University's Representative for approval.

END OF SECTION 01 00 00 00b

SECTION 01 00 00 00c - UNIVERSITY PROJECT PROCEDURES

PART 1 GENERAL

1.01 FIREWALL PENETRATION POLICY

- A. The integrity of firewalls is a crucial element in the performance of the Fire and Life Safety aspects of the Facility. In the event of a fire, unprotected penetrations in rated fire/smoke partitions can contribute to the spread of fire and smoke which will endanger the lives of patients, staff and visitors.
- B. The purpose of this policy is to protect the integrity of fire walls by controlling the frequency and manner in which these barriers are penetrated.
- C. Standards to follow: OSHPD - Office of Statewide Health, Planning and Development, U.L. - Fire Underwriters' Laboratories, Inc., NFPA - National Fire Protection Agency.
- D. The University's Representative shall ensure that all construction work complies with this policy.
- E. Materials and sealants used in the fire rating of penetrations must be as specified in the approved U.L. listed system for that application.
- F. Whenever a firewall is opened for any reason (penetration by any pipe, conduit or cable) the hole, large or small, must be tightly sealed using the appropriate U.L. listed fire rated system.
- G. If the penetration is larger than the maximum specified by the approved U.L. listed system then the barrier must first be restored, using the same materials as existing construction, reducing the penetration to an appropriate size for sealing.
- H. Inspections of all work to ensure that penetrations are properly sealed shall be made by the Inspector of Record.

1.02 APPARATUS AND EQUIPMENT LOCATIONS

- A. Locations of apparatus and equipment indicated on the Drawings are approximate only, and are subject to change to suit operational service as approved by University's Representative.
- B. Furnish and install apparatus and equipment in a manner and in locations which keep openings and passageways clear. Make changes in locations of equipment and materials which may be necessary to accomplish these purposes as approved by University's Representative.

1.03 CORE DRILLING AND CUTTING

- A. Provide drilling and cutting required for this installation. Schedule work in advance to minimize core drilling and cutting.
- B. Secure University's Representative's approval of locations for holes and openings in floors, walls, and ceilings necessary for installation of mechanical equipment, ducts, piping and appurtenances, and keep sizes of such holes and openings to a minimum. Conduct operations in such manner as to prevent cracking or otherwise damaging floors, walls and ceilings. Close holes and openings, and repair, in an approved manner, damages resulting from these operations, leaving no impairment of structural, functional, or architectural quality and match configuration, texture and color of adjacent surfaces.
- C. Holes and openings in or through existing concrete or masonry floors, walls and ceilings, shall be made by drilling with proper size carboloy-tipped twist drills, diamond drill bit, or diamond core drills. Impact drills of any type are not permitted.
- D. Before drilling any holes, review structural drawings for locations of structural reinforcement. Exercise extreme caution so as not to damage structure during drilling.
- E. Any penetrations of the roof need to be coordinated with the University's Representative.

01 - General Requirements

1.04 UNIVERSITY'S REPRESENTATIVE

- A. Monitoring the progress of the work with the Inspector of Record.
- B. Documenting the progress and conditions of the work.
- C. Reviewing and verifying the degree of work completion with that cited in Contractor's monthly payment requests.
- D. Unless specific exceptions are established by the University's Representative's written instructions to do so, the University's Representative and the Inspector of Record will not assume any responsibility in the following areas:
 - 1. Authorizing deviations from contract documents.
 - 2. Personally conducting tests.
 - 3. Entering into any area of responsibility of Contractor's Superintendent.
 - 4. Expediting work for Contractor.
 - 5. Advising or issuing directions relative to construction means and methods.
 - 6. Authorizing Beneficial Occupancy.

1.05 PROJECT INSPECTOR

- A. See Section 01420 - Inspection of Work for Inspector of Record responsibilities.

1.06 OFFICE OF STATEWIDE HEALTH PLANNING AND DEVELOPMENT

- A. See Section 01080 - Regulatory Requirements for OSHPD requirements.

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION-NOT USED

END OF SECTION 01 00 00 00c

SECTION 01 00 00 00d - DEMOLITION, CUTTING AND PATCHING

PART 1 GENERAL

1.01 SUMMARY

- A. Section Includes: Demolition, cutting into work to provide for access, inspection, and performance of other work, and subsequent fitting and patching required to restore surfaces and assemblies to their original condition. Cutting and patching of Work during manufacture of products, and initial fabrication, is not work of this Section.

1.02 SYSTEM DESCRIPTION

- A. Performance Requirements: Do not reduce performance capacities, nor alter the physical and aesthetic characteristics of the Work as determined by the University's Representative, due to performance of cutting and patching.

1.03 DEFINITIONS

- A. Demolition: Includes disconnecting and removing from the premises items shown on plans to be removed, or items which are not required in the finished installation.
- B. Cutting: Includes cutting into existing construction to permit completion of contract work.
- C. Patching: Includes restoration of surfaces disturbed by demolition, cutting, or other contract operations.

1.04 QUALITY ASSURANCE

- A. Employ skilled workers having minimum three years experience with assemblies and materials similar to cutting and patching work required for this Project.
- B. Before cutting and patching the following categories of work, obtain the University's Representative approval to proceed as required in the procedural proposal for cutting and patching.
 - 1. Primary Structural components: Girders, beams, joists, columns, piers, bearing walls, concrete slabs, etc.
 - 2. Secondary Structural Components: Lintels, equipment supports, decking, stair systems, etc.
 - 3. Weatherproof Enclosures: Roofing, flashing, curtain walls, storefront systems, exterior doors and windows.
 - 4. Mechanical, electrical, communications, and conveying systems.
 - 5. Primary operational systems and equipment.
 - 6. Noise and vibration control elements and systems.
- C. Pre-Cutting Conference: Before start of cutting work, meet at Project site with all parties involved in cutting and patching, including mechanical and electrical trades. Review areas of potential interference and conflict between the various trades. Coordinate layout of the work and resolve potential conflicts before proceeding with the work.
- D. Requirements for Structural Work: Do not cut and patch structural work in a manner that would result in a reduction of load-carrying capacity or load-deflections ratio.
- E. Operational and Safety Limitations: Do not cut and patch operational elements or safety related components in a manner that would result in a reduction of their capacity to perform in the manner intended, including energy performance, or that would result in increased maintenance, or decreased operational life of decreased safety.
- F. Visual Requirements: Do not cut and patch work exposed on the building's exterior or in occupied spaces, in a manner that would, in the University's representative's opinion, result in lessening the building's aesthetic qualities. Do not cut and patch work in a manner that would result in substantial visual evidence of cut and patch work. Remove and replace work judged by the University's Representative to be cut and patched in a visually unsatisfactory manner.

01 - General Requirements

- G. Field Measurements: Verify measurements prior to commencing Work.

1.05 PROJECT CONDITIONS

- A. See Section 01021 - Infection Control.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. See Section 01021 - Infection Control.

1.07 TEMPORARY FACILITIES

- A. See Section 01510 - Temporary Facilities and Utilities.

1.08 DELIVERY, STORAGE AND HANDLING

- A. Carefully remove, store, and protect materials designated to be re-used in contract work.
- B. Materials designated for demolition shall become Contractor's property and removed from the Site.
- C. Materials designated to be salvaged for University shall be removed with care, protected, and stored in a location specified by the University.
- D. Comply with minimum requirements in Section 01600 - Material and Equipment.

1.09 SCHEDULING

- A. Except as otherwise indicated or as approved by the University's Representative, proceed with cutting and patching at the earliest feasible time and complete work without delay.
- B. See Section 01044 - University Occupancy and Working Hours

PART 2 PRODUCTS

2.01 MATERIALS

- A. Unless otherwise indicated or directed provide Work identical to adjacent and similar assemblies as determined by the University's Representative. When identical materials are not available, or cannot be used, use materials matching existing adjacent and similar surfaces to the fullest extent possible with regard to visual effect and physical characteristics.
- B. General: Use materials for patching that are identical to existing materials. If identical materials are not available, or cannot be used, use materials that match existing adjacent surfaces to the fullest extent possible with regard to visual effect. Use materials for patching that will result in equal-or-better performance characteristics.
- C. Concrete: Contractor designed mixes to produce following:
 - 1. Concrete, Typical: Compressive strength of 3250 pounds per square inch at 28 days.
 - 2. Light Weight Structural Concrete: Lightweight aggregate and concrete are to conform to ASTM C330.
 - a. Proportion mix to produce concrete having minimum compressive strength of 3,000 pounds per square inch at 28 days and calculated equilibrium unit weight of 110 pounds per cubic foot plus or minus three pounds per cubic foot as determined by ASTM C567, Concrete slump at point of placement is to be minimum necessary for efficient mixing, placing, and finishing. Maximum slump is to be six inches for pumped concrete and five inches elsewhere.
- D. Bonding Agent: "Weldcrete" of Larson Products, "Hornweld" of A.C. Horn, "Sonocrete" of Sonneborn-Contech, or equal.
- E. Grout for patching holes in existing concrete surfaces: Nonshrink type, factory pre-mixed grout, "Vibrofoil" of A.C. Horn, "Ferrolith" of Sonneborn-Contech, or equal.
- F. Existing Ceilings: Remove carefully to minimize dust and debris. Acoustical tile for patching shall match existing adjacent tiles. Conform to requirements of Section 09511 - Suspended Acoustical

Ceilings.

- G. Patching of Holes in Fire-Rated Surfaces: Comply with requirements of Section 07840 - Firestopping.
- H. Weather Exposed Or Moisture Resistant Surfaces Or Elements: Comply with requirements of Section 07550 - Modified Bitumen Torch Membrane Roofing.
- I. Where specifications are not included for items requiring patching, comply with requirements of Article titled "Materials", sub Article titled "General" in this Section and manufacturer's specifications and standards for each product involved.

PART 3 EXECUTION

3.01 EXAMINATION

- A. Verification of Conditions: Examine materials, assemblies and conditions under which the work is to be performed, correct unsafe and unsatisfactory conditions before proceeding with the work; stop Work when conditions occur which might jeopardize the integrity or appearance of materials to remain.
- B. Before beginning demolition work, examine site and verify the following:
 - 1. Existing utility lines to be removed have been disconnected.
 - 2. Utility lines serving occupied portions of building will remain in operation during demolition.
 - 3. Dust barriers are in place, and conditions specified in Sections 01021 - Infection Control, are met.
- C. Before Cutting Operations: Examine surfaces to be cut and patched and conditions under which work is to be performed. If unsafe, or otherwise unsatisfactory conditions are encountered, take corrective action before proceeding with the work.
- D. If any hazardous material, other than asbestos or PCB containing light ballasts or fluorescent lamps are encountered, notify University immediately and obtain instructions for safe handling and removal. See Section 01565 - Hazardous Material Procedures.

3.02 PREPARATION

- A. Protections: Prevent damage to Work during cutting and patching. Protect from weather Work exposed to the exterior by cutting and patching operations. Provide temporary shoring and bracing to maintain existing position and prevent movement of Work.
- B. Do not cut existing mechanical systems and utilities until provisions to maintain service are in place.
- C. Where possible, review proposed procedures with the original installer and comply with original installer's recommendations.
- D. Temporary Support: To prevent structural failures, provide temporary support of work to be cut.
- E. Avoid interference with use of adjoining areas or interruption of free passage to adjoining areas.
- F. Take precautions not to cut existing pipe, conduit, or ducts serving the building but scheduled to be relocated until provisions have been made to bypass them.
- G. Rooms adjacent to contract work will be occupied during the construction period. Maintain a tight barrier at openings into those rooms and remove debris in covered containers.

3.03 CUTTING

- A. Cutting: Use methods least likely to damage work to be retained and adjoining work. Make penetrations neatly, to sizes required, minimize disturbance of Work to remain. Use tools designed for sawing or grinding, not hammering and chopping. Cut and drill exposed surfaces from finished side into concealed surfaces.
- B. Comply with requirements of applicable sections of mechanical and electrical specifications for cutting and patching of mechanical and electrical work.
- C. Unless otherwise required, cap, valve, and seal remaining portion of cut and abandoned utility services, prevent entrance of moisture and foreign matter.

01 - General Requirements

- D. Ensure by-pass of utility services, such as pipe and conduit, has been completed before cutting, where such utility services are shown or required to be removed, relocated, or abandoned.

3.04 PATCHING

- A. Seams: Durable without change of texture, plane, and profile in finished Work. Restore exposed finishes of patched areas and where necessary extend finish restoration into retained adjoining work in a manner which will eliminate evidence of patching and refinishing.
- B. Floor and Wall Surfaces: Patch and repair provide even surface of uniform color and appearance. Where necessary to achieve uniform color and appearance, remove existing finish and coverings and replace with new materials.
 - 1. Where patch occurs in a smooth finished surface, extend final finish over entire unbroken surface containing patch to nearest natural break.
- C. Ceilings: Repair and rehang ceilings. Provide an even plane surface of uniform appearance.
- D. Tolerances: In addition to performance requirements of this Section, comply with tolerances specified in individual technical Sections for repair of specific assemblies and materials.
- E. Plaster Installation:
 - 1. Unless otherwise indicated, provide 3-coat work in accordance with the California Lathing and Plastering Contractors Association, Inc. (CLPC) recommendations.
 - 2. Finish gypsum plaster with smooth-troweled surface. Sand lightly to remove trowel marks and arrises.
 - 3. Cut, patch, point-up, and repair plaster as necessary to accommodate other work and to restore cracks, dents, and imperfections.
- F. Hangers and Supports:
 - 1. Provide new hangers and supports for existing piping, conduit, or ductwork to remain after removal of existing partitions or ceilings. Conform to support details specified or shown for new work.
- G. Holes in Existing Concrete Floor Slabs, with a diameter not over the depth of the slab: Ream to a conical shape not less than 0.25:1 with the smallest diameter at the bottom of the slab. Roughen surfaces and clean away dust and loose particles. Fill with grout specified in this Section for patching holes in existing concrete surfaces. For patching larger openings, notify the University's Representative for this project.

3.05 PATCHING EXISTING DAMAGE

- A. Floor Openings around Pipe, Duct, and Conduit Penetrations:
 - 1. Remove non-rated or loose filler material and fill with approved 2-hour fire resistive packing.
 - 2. **Comply with Mechanical and Electrical specifications.**
- B. Piping: Restore damaged pipe covering to its original condition.

3.06 REPAIRING

- A. Repair and protection is Contractor's responsibility, regardless of the assignment of responsibility for inspection, testing, or similar services.
- B. Upon completion of inspection, testing, sample-taking, and similar services performed on the work, repair damaged work and restore substrates and finishes to eliminate deficiencies, including deficiencies in the visual qualities of exposed finishes.
- C. Repair finishes to match existing conditions. Where necessary, extend finish restoration to adjoining work in a manner, which will eliminate evidence of patching and refinishing.
- D. Restore damaged ceilings to match existing conditions.
- E. Restore utilities to their original condition.

3.07 LEVELING EXISTING CONCRETE FLOOR SLABS

- A. Patch depressions and level existing concrete floor slab to a surface plane tolerance of maximum 1/8-inch in 10-feet. Test with a 10-foot long straight edge.
- B. Apply underlayment over entire work area in strict accordance with manufacturer's written instructions, before any partition framing is placed.
- C. Keep traffic off the floor during curing period in accordance with manufacturer's printed recommendations, but in any case not less than 4-days.

3.08 ELECTRICAL DEMOLITION

- A. Do not shut down electrical service without approval of University.
- B. Do not begin demolition until all conduits have been traced by Contractor and services have been disconnected.
- C. Provide additional wiring and work as required to maintain service to adjacent spaces during demolition.
- D. Remove electrical service in demolition area including items in existing walls and ceilings to remain.
- E. Demolition of electrical Services:
 - 1. Remove device and wiring to panel without disturbing existing service to remain.
 - 2. Remove empty conduit back to boundary of Project area.
- F. Relocate or re-hang existing conduit when existing supports have been demolished or where there is interference with new light fixtures.
- G. Electrical demolition work shall be performed by certified journeyman electrician.

3.09 CLEANING

- A. Standard for cleaning Work: comply with requirements of Section 01710 - Clean up and Disposal throughout the project and Section 01700 - Project Closeout for final cleaning requirement in conjunction with cutting and patching activities.

END OF SECTION 01 00 00 00d

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 00 00 00e - REGULATORY REQUIREMENTS

PART 1 GENERAL

1.01 GENERAL

- A. The Work shall be performed in accordance with Applicable Code Requirements and applicable requirements of all other regulatory agencies, including, but not limited to, the following:
1. California Code of Regulations, Title 8, Industrial Safety.
 2. California Code of Regulations, Title 13, Hazardous Materials Transportation.
 3. California Code of Regulations, Title 17, Radiation Safety.
 4. California Code of Regulations, Title 19, Public Safety, State Fire Marshal Regulations
 5. California Code of Regulations, Title 20, Public Utilities and Energy.
 6. California Code of Regulations, Title 21, Public Works.
 7. California Code of Regulations, Title 23, Underground Storage Tank Regulations.
 8. California Code of Regulations, Title 24, Part 1, Administrative Regulations.
Part 2, California Building Code.
Part 3, the California Electrical Code.
Part 4, the California Mechanical Code.
Part 5, the California Plumbing Code.
Part 6, the California Energy Code.
Part 7, the California Elevator Safety Constr. Code.
Part 8, the California Historical Building Code.
Part 9, the California Fire Code.
Part 12, State Referenced Standards Code.
 9. California Code of Regulations, Title 25, Housing and Community Development.
 10. California Code of Regulations, Title 26, Toxics.
 11. National Fire Protection Association (NFPA), 1996
 12. NEC (National Electric Code), 2004 Edition with 2007 California Amendments; 2007 CEC (California Electric Code), Part 3, Title 24, CCR (California Code of Regulations)
 13. NFPA No. 99, 1999 - Health Care Facilities
 14. NFPA No. 101, 1997 - Life Safety Code
 15. NFPA No. 72, 1999 - National Fire Alarm Code
 16. NFPA No. 13, 1999 - Sprinkler System
 17. NFPA No. 80, 1996 - Fire Doors and Windows
 18. UBCS (Uniform Building Code Standards), 2007 Edition
 19. OSHPD (OFFICE OF STATEWIDE HEALTH, PLANNING AND DEVELOPMENT)
 20. CALIFORNIA HEALTH AND SAFETY CODE
 21. FEDERAL OCCUPATIONAL SAFETY AND HEALTH ADMINISTRATION
 22. AMERICANS WITH DISABILITIES ACT, ADA, Title III and California Access Code, Title 24 per UBC 1997 Edition with 2007 California Code of Regulations Amendments
- B. Unless otherwise specified, specific references to codes, regulations, standards, manufacturers' instructions, or requirements of regulatory agencies, when used to specify requirements for materials or design elements, shall mean the latest edition of each in effect at the date of submission of bids, or the date of the Change Order or Field Order, as applicable.

1.02 CONFLICTS

- A. If a conflict exists between referenced regulatory requirements or between referenced regulatory requirements and the Contract Documents, Contractor shall notify University's Representative and request that the conflict be resolved.

01 - General Requirements

1.03 OFFICE OF STATEWIDE HEALTH PLANNING AND DEVELOPMENT

- A. Office of Statewide Health Planning and Development, referred to by the abbreviation OSHPD, located at 400 'R' Street, Suite 200, Sacramento, CA, 95811, is the agency having jurisdiction over Project design and construction.
- B. OSHPD will require a Licensed Contractor's Declaration.
- C. Inspector of Record: Shall be employed by University and approved by University's Representative, Structural Engineer and OSHPD.
- D. Testing Laboratories: Shall be employed by University and approved by University's Representative and OSHPD.
- E. OSHPD will require Addenda Approval submitted by University's Representative.
- F. OSHPD will require a Building Permit for the project submitted by University's Representative. No fees are required from Contractor, nor is any local building permit required.
- G. OSHPD will require Change Order Approval submitted by University's Representative.
 - 1. Substitutions are considered to be Change Orders and must be approved by OSHPD prior to fabrication or use.
- H. OSHPD will require Verified Report forms to be filed every three months during construction. Separate verified reports are required from Architect, Consultants, Project Inspector, and Contractor.
- I. Copies of forms specified in paragraphs 1.03E, 1.03F, 1.03G, and 1.03H above are available from the University's Representative.

1.04 QUALITY CONTROL

- A. Start of Construction: Notify OSHPD of the start of construction in accordance with Title CCR, Title 24.

1.05 PERMITS

- A. A local building permit need not be obtained, nor is the construction subject to local building code requirements, unless Contract Documents reference such requirements for specific portions of the work.
- B. A permit is required from OSHPD.

1.06 GENERAL REQUIREMENTS

- A. Title 24: The intent of Drawings and Specifications is to reconstruct the hospital building in accordance with Title 24, California Code of Regulation. Should any conditions develop not covered by the Contract Documents wherein the finished work will not comply with Title 24, California Code of Regulations (CCR), a Change Order detailing and specifying the required work shall be submitted by the University's Representative to, and approved by OSHPD before proceeding with the work.
- B. Penetrations: Seal penetrations through 2-hour fire rated floors or walls with U.L. approved systems.
- C. Mechanical and Plumbing System Anchorage: Support and brace pipes, ducts, and conduits, in accordance with OSHPD Pre-Approved Unistrut Seismic Bracing System, and SMACNA "Guidelines for Seismic Restraints of Mechanical and Plumbing Piping Systems".

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION-NOT USED

END OF SECTION 01 00 00 00e

SECTION 01 00 00 00f - ABBREVIATIONS, SYMBOLS AND DEFINITIONS

PART 1 GENERAL

1.01 DEFINITIONS

- A. The following terms, when used on the Drawings or in the Specifications, shall have the following meanings:

<i>TERM</i>	<i>MEANING</i>
1. AS DIRECTED	"As directed by University's Representative."
2. AS REQUIRED	"As required by Applicable Code Requirements; by good building practice; by the condition prevailing; by the Contract Documents; by University; or by University's Representative."
3. AS SELECTED	"As selected by University's Representative."
4. BY OTHERS	"Work on the Project that is outside the scope of Work to be performed by Contractor under the Contract, but that will be performed by University, Separate Contractors, or other means."
5. EQUAL	"Of same quality, appearance, and utility to that specified, as determined by University's Representative. Contractor bears the burden of proof of equality."
6. FURNISH	"Supply only, not install."
7. INSTALL	"Install or apply only, not furnish."
8. NEW (N)	As provided in manufacturer's original packaging. (Unused, not used, not refurbished).
9. OWNER	"The University".
10. OWNER-FURNISHED, CONTRACTOR-INSTALLED	"To be furnished by University at its cost and installed by Contractor as part of the Work."
11. PROJECT SITE	"Geographical location of the Project."
12. PROVIDE	"Furnish and install."
13. "PUNCH LIST"	"Comprehensive List of Items to be completed or corrected prior to final payment." Reference: A201-1997 AIA General Conditions of the Contract, Articles 9.8.2 and 9.8.3.
14. SHOWN	"As indicated on the Drawings."
15. SPECIFIED	"As written in the Contract Documents."
16. SUBMIT	"Submit to University's Representative."

- 17. TESTING LABORATORY OR TESTING AGENCY Independent entities engaged to perform specific inspections and tests. See Section 01400.
- 18. WORK AREA Area enclosed by barricades.

1.02 ABBREVIATIONS

- A. Abbreviations, used on the Drawings, are listed thereon.
- B. The following abbreviations of organizations may be used in the Contract Documents:
 - 1. AABC Associated Air Balance Council
 - 2. AAMA Architectural Aluminum Manufacturers' Association
 - 3. AASHTO American Association of State Highway and Transportation Officials
 - 4. ACI American Concrete Institute
 - 5. AIA American Institute of Architects
 - 6. AIMA Acoustical and Insulation Materials Association
 - 7. AISC American Institute of Steel Construction
 - 8. AMCA Air Moving and Conditioning Association
 - 9. ANSI American National Standards Institute (formerly American Standards Association, ASA)
 - 10. APA American Plywood Association
 - 11. ARI Air Conditioning and Refrigeration Institute
 - 12. ASC Adhesive and Sealant Council
 - 13. ASCE American Society of Civil Engineers
 - 14. ASHRAE American Society of Heating, Refrigerating, and Air-Conditioning Engineers
 - 15. ASME American Society of Mechanical Engineers
 - 16. ASTM American Society for Testing and Materials
 - 17. AWPA American Wood Preservers' Association
 - 18. AWS American Welding Society
 - 19. AWWA American Water Works Association
 - 20. BHMA Builders Hardware Manufacturers' Association
 - 21. CAC State of California Administrative Code (Same as CCR)
 - 22. CBSC California Building Standards Commission
 - 23. CCR California Code of Regulations
 - 24. CLFMI Chain Link Fence Manufacturers' Institute
 - 25. CPM Critical Path Method
 - 26. CRSI Concrete Reinforcing Steel Institute
 - 27. CSS State of California, Business and Transportation Agency, Department of Public Works, Division of Highways' "Standard Specifications"
 - 28. ETL Electrical Testing Laboratories
 - 29. FGMA Flat Glass Marketing Association
 - 30. FM Factory Mutual System, Factory Mutual Engineering Corporation
 - 31. FS Federal Specifications
 - 32. ICBO International Conference of Building Officials
 - 33. IPCEA Institute of Power Cable Engineers Association
 - 34. MM State of California, Business and Transportation Agency, Department of Public Works, Division of Highways' "Materials Manual"
 - 35. NEBB National Environmental Balancing Bureau
 - 36. NEC National Electric Code
 - 37. NEMA National Electric Manufacturers' Association
 - 38. NETA National Electrical Testing Association
 - 39. NFPA National Fire Protection Association
 - 40. OSA Office of the State Architect
 - 41. OSHPD Office of Statewide Health Planning and Development
 - 42. OSHA Federal Occupational Safety and Health Act

43. PS	United States Department of Commerce Product Standard
44. RIS	Redwood Inspection Service
45. SBC	State of California Building Code
46. SFM	State of California, Office of State Fire Marshal
47. SMACNA	Sheet Metal and Air Conditioning Contractors National Association, Inc.
48. SMC	State of California Mechanical Code
49. SPC	State of California Administrative Code
50. TCA	Tile Council of America
51. UMC	Uniform Mechanical Code
52. UPC	Uniform Plumbing Code
53. UBC	Uniform Building Code
54. UL	Underwriters' Laboratories, Inc.
55. USS	United States Standard
56. WCLIB	West Coast Lumber Inspection Bureau
57. WIC	Woodwork Institute of California

- C. Additional abbreviations, used on Drawings, are listed thereon.
- D. Applicable standards of the construction industry have the same force and effect (and are made a part of the Contract documents by reference) as if copied directly into the Contract documents, or as if published copies were bound herewith. Unless specified otherwise, comply with the standard in effect as of date of the Contract Documents. Where copies of standards are needed, obtain such copies directly from the publication source.

1.03 SYMBOLS

- A. Symbols, used only on the Drawings, are shown thereon.

END OF SECTION 01 00 00 00f

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 00 00 00g - PROJECT MEETINGS

PART 1 GENERAL

1.01 ILSM CONFERENCE

- A. An ILSM conference is required before commencement of Work. It will be conducted by University's Representative. See Section 01110 - University Interim Life Safety.

1.02 PRECONSTRUCTION CONFERENCE

- A. Prior to commencement of Work, a preconstruction conference will be arranged to discuss procedures which are to be followed during performance of the Work.
- B. Location: As designated by University's Representative.
- C. Conducted by: University's Representative will arrange, set agenda and do meeting minutes.
- D. Attending shall be:
 - 1. University's Representative.
 - 2. University's Facility Engineers
 - 3. University's Consultants and University's Representative's Consultants, as appropriate.
 - 4. Contractor.
 - 5. Superintendent.
 - 6. Subcontractors, as appropriate.
 - 7. Others, as appropriate.

1.03 BILLING MEETING

- A. A billing meeting shall be arranged each month prior to submittal of the Application For Payment.
- B. Location: As designated by University's Representative.
- C. Conducted by: University's Representative will arrange, set agenda and do meeting minutes.
- D. Attending shall be:
 - 1. University's Representative.
 - 2. University's Facility Engineers
 - 3. University's Consultants and University's Representative's Consultants, as appropriate.
 - 4. Contractor.
 - 5. Superintendent.
 - 6. Subcontractors, as appropriate.
 - 7. Others, as appropriate.

1.04 PROGRESS MEETING

- A. During the course of construction, progress meetings will be held to discuss and resolve field problems.
- B. Location: As designated by University's Representative.
- C. Conducted by: University's Representative will arrange, set agenda and do meeting minutes.
- D. Attending shall be:
 - 1. University's Representative.
 - 2. University Facility Engineers
 - 3. University's Consultants and University's Representative's Consultants, as appropriate.
 - 4. Contractor.
 - 5. Superintendent.
 - 6. Subcontractors, as appropriate.
 - 7. Others, as appropriate.

01 - General Requirements

1.05 GUARANTEES, BONDS, AND SERVICE AND MAINTENANCE CONTRACTS REVIEW MEETING

- A. Eleven months following the date of Substantial Completion, a meeting shall be arranged reviewing the guarantees, bonds, and service and maintenance contracts for materials and equipment.
- B. Location: As designated by University's Representative.
- C. Conducted by: University's Representative will arrange, set agenda and do meeting minutes.
- D. Attending shall be:
 - 1. University Facility Engineers
 - 2. University's Consultants, as appropriate.
 - 3. Contractor.
 - 4. Subcontractors, as appropriate.
 - 5. Others, as appropriate.

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION-NOT USED

END OF SECTION 01 00 00 00g

SECTION 01 10 00 00 - INFECTION CONTROL

PART 1 GENERAL

1.01 SUMMARY

- A. Section includes procedures for Infection Control during construction.
- B. Infection control is critical in all hospital areas. Dust in ceilings and construction debris contains fungus, which, if inhaled by patients, can cause pneumonia and even death. Construction activities causing disturbance of existing dust, or creating new dust, must be conducted in tight enclosures cutting off any flow of particles into patient areas.
- C. The University is committed to avoid the transmission of infectious diseases in and within the University's Medical Center. The Contractor shall inform all workers on the jobsite, not to enter the hospital if they suspect they may have a communicable illness that could be transmitted.
- D. Before any construction on site begins, all workers on site shall attend a mandatory meeting sponsored by the University's Department of Hospital Epidemiology and Infection Control (HEIC), for training and instruction on precautions to be taken. After start of construction, all new workers shall be required to attend a new meeting.
 - 1. In addition to above, a bi-monthly review meeting shall be required with jobsite superintendents and a representative from each subcontractor.
 - 2. All construction workers shall be required to complete Infection Control Training at least once a year.
 - 3. Contractor shall keep a record of all persons attending this meeting and submit records to the University's Representative.
- E. Temporary construction barriers and closures above ceilings, as described in this section, shall be dust tight.
- F. Removal of debris shall be outside of normal work hours and shall be in tightly covered containers, as described in this section.
- G. When required by University, negative air machines shall provide airflow into construction area not less than 100 FPM at barricade entrances with doors fully open. A written report, from the University's Inspector of Record, shall be submitted confirming specified air velocity whenever barricade is erected or modified. Negative air machines shall be connected to emergency power and run continuously.
- H. Walk-off mats at barricade entrances, as required in this section, shall be changed as often as necessary, or as required by University's Representative, to prevent accumulation of dust.
- I. Any dust tracked outside of barrier shall be removed immediately. All cleaning outside barrier should be by HEPA-filtered vacuum or other University-approved method.
- J. Any ceiling access panels opened for investigation beyond sealed areas shall be replaced immediately when unattended.
- K. Block off all existing ventilation ducts within the construction area. Method of capping ducts shall be dust tight and withstand airflow.
- L. Whenever openings are made into existing ceilings, provide portable enclosure enclosing ladder and sealing off opening, fitted tight to ceiling. Provide thorough cleaning of existing surfaces that become exposed to dust, before start of University's occupancy.
- M. Removal of construction barriers and ceiling protection shall be done carefully, outside of normal work hours. Vacuum and clean all surfaces free of dust after the removal.
- N. Whenever access panels are opened in occupied areas, for work above ceilings, provide portable enclosure enclosing ladder and sealing off opening, fitted tight to ceiling.

01 - General Requirements

- O. Polyethylene shall be fire retardant type, as specified in this section.
- P. Vacuuming outside areas not under negative pressure shall be with a certified HEPA-filtered vacuum.
- Q. University's Hospital Epidemiology and Infection Control Staff may order and monitor mold counts in the vicinity of project. Whenever safe levels are exceeded, Contractor will be notified to correct conditions immediately to avoid a fine and work stoppage as described below.
 - 1. Work shall be stopped on the project whenever a hazardous infection control deficiency exists.
 - 2. The Contractor shall take immediate action to correct deficiencies.
 - 3. Failure of Contractor to correct such deficiencies will result in corrective action taken by the University Pursuant to Article 12.2 of the General Conditions.
- R. Before demolition or construction begins, a complete field review of infection control policies will be conducted. A check list will be filled out and signed by the University's Project Manager, Project Inspector, Infection Control Nurse, and Contractor, confirming that the area is ready for work to begin. Post Check List with signatures in clear plastic sleeve on wall next to barricade door.
- S. Construction personnel shall be clean, with clothing and tools free of dust before returning to occupied areas.
- T. If requested by the University's Representative, install air pressure gauge such as magnehilic gauge or manometer on outside of barricade wall, with clear tubes to inside and outside spaces so that University can visually check if negative air environment is being maintained in the construction area.

1.02 SUBMITTALS

- A. Submit certification by a qualified third party for the proper operation of HEPA-filtered negative air machines and vacuum cleaners.
- B. Comply with requirements specified in this section.

1.03 REGULATORY REQUIREMENTS

- A. Install and use temporary facilities in accordance with the following:
 - 1. California Code of Regulations, Title 24.
 - 2. Federal, State, and local codes and regulations.
 - 3. Utility company requirements.
 - 4. CAC Title 8, Chapter 4, Industrial Safety.
 - 5. CAC Title 24, Subchapter 7, General Safety Orders.
- B. ANSI Standards: Comply with applicable provisions of ANSI A10- Series standards on construction safety, including A10.3, A10.4, A10.5, A10.6, A10.7, A10.8, A10.9, A10.10, A10.11, A10.12, A10.13, A10.14, A10.15, A10.17, A10.18, A10.20, and A10.22.
- C. NFPA: Comply with NFPA 241 "Building Construction and Demolition Operations."

1.04 QUALITY ASSURANCE

- A. Project Conditions
 - 1. Examine work areas to ensure the provisions of this section are being maintained.
 - 2. Do not obstruct public corridors or elevator lobbies. Keep exits and entrances open and passable.
 - 3. Conduct work so as not to disturb University's activities.
 - 4. Adjacent occupied areas will remain in operation during the period of construction.
 - 5. Where a breach of these polices are noticed; immediate corrective action is to be taken by the Contractor.
 - 6. Report all deficiencies and/or problems to the University's Representative.
- B. Enforcement:

1. A breach of the Infection Control Policy may result in a fine of \$2,500.00 for each occurrence.
2. Violations of Infection Control Policy may affect status as a responsible Contractor for bidding future work.
3. Gross irresponsibility may result in removal of Contractor from project.

1.05 DELIVERY, STORAGE, AND PROTECTION

- A. See Section 01600 - Material and Equipment.

1.06 ENVIRONMENTAL REQUIREMENTS

- A. Air Quality Control:
 1. Where applicable, fasten windows shut.
 2. Ventilate barricaded construction areas by use of negative air machines exhausted through filters to the outside of building.
 3. Provide a minimum of 2 negative air machines and cease any construction in areas not serviced by negative air machines.
 4. Vent negative air machines to outside by removing existing windows and replacing them with vented sheet metal panels having fittings for exhaust holes or as directed by University's Representative.
 5. Provide added exhaust during welding.
 6. Maintain airflow of at least 100 F.P.M. (feet per minute) with door fully open at barricade entrance openings. Measurement will be verified by University's Inspector of Record (IOR)
 7. Change HEPA-filters as frequently as necessary for duration of the project to maintain specified negative pressure in the construction area and filter particles a maximum of 0.12 microns.
- B. Walk Off Mats: Walk-off style tack-mats shall be placed inside the construction barricade, with a final 'walk-off' style tack-mat outside of the barricade door.
- C. Perimeter Isolation: At perimeter of work areas, between finish ceiling and upper concrete slab, provide non-combustible barriers to seal off adjacent patient or other occupied areas from work areas. Cut to fit around all existing utilities and seal around all penetrations.
- D. Enclosure Outside Work Area: Whenever work is necessary outside of construction barricades, including spaces above furred ceilings, contain space where work is being done within a full height polyethylene sheet barrier, minimum 4 mil thicknesses, tightly taped at edges and along seams. Provide overlapping flap at least 2 feet wide for access.
- E. Ceiling Access: Whenever openings are made into ceilings, provide dust tight polyethylene covering taped in place to completely seal opening until final patching is done.
- F. Access Protection: Whenever access panels are opened for work above ceilings, provide polyethylene shroud around opening and ladder, taped to floor and to ceiling.
- G. Lighting: Provide sufficient temporary lighting to ensure proper workmanship and safety in all areas of the Contract.
- H. Storage: At no time shall any construction equipment or material be stored outside the construction barricades.

1.07 INFECTIOUS ILLNESS PRECAUTIONS

- A. The University is committed to avoiding the transmission of infectious diseases in and within the hospital. The Contractor shall inform all workers on the job site not to enter the hospital if they suspect they have a communicable illness that could be transmitted.
- B. Influenza (the flu) is a contagious respiratory illness caused by the influenza virus. It can cause mild to severe illness, and at times can lead to death. The most effective way to prevent infection from an influenza virus is through annual flu vaccination.
- C. All contractors working at University of California are encouraged to have an annual influenza vaccine. In some circumstances, the University may make vaccines available to contractors free of charge and will

01 - General Requirements

provide documentation to verify the shot has been received. The University's Representative will provide information regarding the Flu Shot Program.

- D. The University's Chief Medical Officer determines the relevant dates of the influenza season each year. Generally, influenza season extends from November to March, but can be longer.
- E. During Flu Season, Contractor and all job site workers may be required to show verification that they received the flu vaccine.
- F. In the event Contractor's and/or Subcontractors' job site workers cannot or refuse to verify receipt of the vaccine, or do not choose to have be vaccinated, those employees will be required to wear a mask at all times while in any University Patient Care Areas for the duration of the influenza season. Masks will be provided by the University. Patient Care Areas are defined as areas within, adjacent to, or opening into the following areas:
 - i. Admissions & Registration
 - ii. Patient Rooms/cubicles
 - iii. Hallways of units where patient rooms are located
 - iv. Nursing stations of units where patient rooms are located
 - v. Procedural areas
 - vi. Hallways connecting waiting areas and exam areas
 - vii. Visitor lounges
- G. Masks will not be required within job site areas
- H. University's Project Manager, Inspectors, Infection Control personnel, and Facilities Personnel may monitor compliance with these requirements.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Used materials for protection enclosures are acceptable if approved by University's Representative and if adequate for required purposes, otherwise new materials will be required. Use and methods of installation shall not create unsafe conditions or violate Applicable Code Requirements.
- B. Construction materials are to be non-combustible. Polyethylene is to be fire-retardant and listed by Underwriters Laboratories.

2.02 TEMPORARY CONSTRUCTION FACILITIES

- A. See Section 01510 - Temporary Facilities and Utilities

2.03 NEGATIVE AIR PRESSURE EQUIPMENT

- A. Description: A local exhaust system capable of maintaining a constant low velocity air flow into the decontamination enclosure system and work area from adjacent unsealed areas. The exhaust system equipment is to have a 2 stage filtering system. The first stage to be a pre-filter for particle sizes of 100 micrometers and larger and a second stage pre-filter effective for particle sizes down to 5 micrometers.
- B. Determining Ventilation Requirements: Containment volume to be calculated in cubic feet of the work area by multiplying floor area by the ceiling height. Total ventilation requirements in cubic feet per minute (cfm) for the work area to be calculated by dividing the volume by the air change rate. An adequate number of Negative Air Machines shall be provided to supply a minimum of one air change every 15 minutes.

- C. Enclosure and Mechanical Components:
1. Negative Air Machine (NAM) Cabinet: To be constructed of steel or other durable material able to withstand damage from rough handling and transportation. Width of the cabinet to be less than 30 inches, to fit through standard size doorways. Cabinet to be factory sealed to prevent asbestos-containing dust from being released during use, transport, or maintenance. Access to, and replacement of, air filters will be from the intake end. NAM unit to be mounted on casters or wheels.
 2. Fan: Capacity to be rated according to useable air-moving capacity under actual operating conditions. Centrifugal-type fan to be used.
 3. Filters:
 - a. Filter Media: Folded into closely pleated panels completely sealed on all edges with a structurally rigid frame.
 - b. A continuous rubber gasket to be located between the filter and the filter housing to form a tight seal.
 - c. Each filter to be certified by the manufacturer to have an efficiency of not less than 99.97 percent when challenged with 0.3mm dioctylphthalate (DOP) particles. Testing to be in accordance with Military Standard Number 282, and Army Instruction Manual 136-300-175A.
 - d. Each filter to bear a UL LABEL to indicate the ability to perform under specified conditions.
 - e. Each filter to be marked with the name of the manufacturer, serial number, airflow rating, efficiency, resistance, a direction of test airflow.
 - f. Final filter to be the HEPA type.
 - g. Location of the pre-filters is to occur either on, or in, the intake grid to the exhaust unit and held in place with a special housing or clamps.
- D. Electrical Components:
1. Each NAM unit shall have a permanent label displaying approval by the National Electrical Manufacturers Association (NEMA) and the Underwriters Laboratories (UL).
 2. Each NAM unit shall be equipped with an overload protection sized for the equipment.
 3. The motor, fan, fan housing, and cabinet shall be properly grounded.
- E. Additional NAM Features shall include the following:
1. An Electrical Interlock preventing operation of the unit when it is without a HEPA filter.
 2. An Automatic Shutdown System to stop the fan in the event of a rupture in the HEPA filter or a blocked air discharge.
 3. Warning Lights to indicate normal operation (green), moderately high pressure drop across the filters, such as due to filter overloading (yellow), and too high of a pressure drop due to an overloaded or ruptured HEPA filter or obstructed discharge (red).
 4. Instruments, such as a magnehelic gauge or manometer, to measure the pressure drop across filters and indicate when filters have become loaded and need to be changed.
 5. An audible alarm if the unit shuts down due to the operation of the safety systems.
 6. Annual testing certificate from a University-approved testing agency indicating the unit has been tested, when it was tested and certified for intended use.
- F. Operation:
1. Air Pressure: A differential pressure must be maintained at any point in the work area of not less than (-) 0.025 inches water gauge relative to the pressure at any point outside the work area at all times, unless otherwise noted or approved by the University's Representative.
 2. Exhaust Location: Exhaust units to be located so makeup air enters the work area primarily through the decontamination units and traverses the work as much as possible. Position the exhaust units a maximum distance from the worker access opening or other makeup air sources. Place the end of unit, or its exhaust duct, through an opening in the plastic barrier, or wall covering. Seal plastic around the unit or duct with tape.
 3. Venting: Vent exhaust to the outside of the building. If it has been determined that it is not feasible to vent the exhaust to the outside of the building, notify the University's Representative for direction.
 4. Makeup Air: Makeup Air shall be taken from the entrance vestibule to the construction site. Cover flaps are to reseal automatically if the Negative Air Machine should shut down for any reason.

01 - General Requirements

Construct vestibule door openings to ensure a positive seal.

- G. Required Features:
 - 1. High Efficiency Particulate Absolute (HEPA) filtration system to have a UL 586 label. Filters are to be marked with the following performance information:
 - a. Air Flow Rating
 - b. Efficiency and Resistance
 - c. Direction of Air Flow
- H. NAM Exhaust Hoses: Flexible, steel reinforced, heavy-duty hoses, positively fastened to negative air machines with metal straps or clamps; Type: Federal Hose Manufacturing Company, Spiratube, or equal.

PART 3 EXECUTION

3.01 PREPARATION

- A. Ensure Temporary Facilities requirements have been reviewed and approved and ready for installation prior to demolition procedures.

3.02 INSTALLATION

- A. Obtain University's approval for exact location and details of fire rated barrier construction.
- B. Barriers to have Level 4 drywall finish, 6: high vinyl base and be painted on corridor side in color approved by University. Mount project signed as directed by University.
- C. Locate construction barricade rated doors, frames and vestibules as directed by University. Swing doors as directed by University. Provide 'Omnilock' or equal, key punch combination hardware.
- D. Tightly seal top, bottom, and all joints of construction barricades with masking tape to prevent spread of dust into occupied areas.
- E. Temporary Ceilings: Provide Temporary Ceilings in locations where existing ceilings have been removed above public corridors and occupied spaces:
 - 1. Temporary Supports: Approximately 2 feet on center and around perimeters.
 - 2. Gypsum Board: Removable panels on support system, taped dust-tight between work periods.
- F. Access Provisions: Provide ramps, stairs, ladders, and similar temporary access elements as reasonably required to perform the work and facilitate inspection during installations.
- G. Access in Occupied Areas: Where work occurs in occupied areas, provide access openings through existing plaster, gypsum board, or acoustical ceilings. Restore ceilings to original condition after work is complete.
- H. Modify and extend systems as required.
- I. Maintain and operate systems to provide continuous service.

3.03 SPECIAL CEILING PROTECTION

- A. Schedule in advance work in ceiling spaces above occupied rooms, in accordance with project specification or as scheduled with University's Representative.
- B. Special dust control is required as follows:
 - 1. Seal off cracks and openings around light fixtures.
 - 2. Provide new 24-inch square ceiling access panels in existing rooms wherever required for installation of special ceiling protection work.
 - 3. Make preliminary access openings at bottoms of partitions to be removed and fill existing obsolete floor penetrations and cracks around existing piping and conduit passing through floor.
 - 4. Provide barriers at perimeter of work areas between ceilings and upper concrete slabs to seal off patient and occupied areas from work areas.
 - 5. Patching of Penetrations:

- a. Provide firestopping materials currently classified with U.L. as “fill, void, or cavity materials” and “Through Penetration Firestop Systems” and “Through Penetration Firestop Devices”, compatible with floor and wall construction and at least equal in time rating to the barrier through which they are listed.
- C. Fix exterior windows shut by means of stainless steel screws.
- D. Ensure Special Ceiling work, as described above in (B), is in place before any major demolition or construction starts.

3.04 ABOVE CEILING ACCESS

- A. Permission must be obtained before working outside the Construction Area. Before removing any ceiling tile the Contractor must obtain a Ceiling Access Permit from Facility Engineering.
- B. Any ceiling access panels opened for investigation beyond sealed areas shall be replaced immediately when unattended. Broken or soiled ceiling tiles shall be replaced at contractor's cost.
- C. Whenever access panels are opened in occupied areas, for work above ceilings, contractor shall provide portable enclosure, enclosing ladder and sealing off opening tight to ceiling.
- D. If the area could be contaminated with asbestos make arrangements with the University's Medical Center Project Manager/Building Manager to have the area checked by an Industrial Hygienist and insure area is properly decontaminated.
- E. Use the University of California Hazardous Materials Procedures, available from University's EH&S and provided as follows:
- F. Ceiling/Wall Access Policy
 - 1. Applies to work in Patient Care Areas and Sensitive areas.
 - 2. All Areas at UC are to be considered Sensitive Areas unless specifically waived in writing by the University.
 - 3. Before any construction on site begins under this section, all workers on site will be required to attend a mandatory meeting sponsored by HEIC for training and instruction on precautions to be taken.
 - 4. Summary
 - a. Section includes methods and procedures to protect Patients and sensitive areas from acquiring fungal infections or other contamination associated with dust inhalation, and therein is referred to as the Ceiling / Wall Access Policy.
 - b. Infection Control is critical in all Patient Care Areas. Dust in ceilings, construction debris and dust contains fungus, which if inhaled by patients can cause pneumonia and even death. Construction activities causing disturbance of existing dust, or creating new dust, must be conducted in tight enclosures cutting off any flow of particles into patient areas. (Corridor locations adjacent to Long/Moffitt Hospital and extending 100 feet into Medical Sciences Building are deemed to be Patient Care Areas.)
 - 5. Quality Assurance
 - a. Work Tag:
 - 1) Report to University's Facilities Maintenance Office, for the building where the work is to be done and complete a Ceiling Access Form and receive a work tag, prior to commencing work of this section.
 - 2) An Approved Work Tag must be attached to the ceiling access enclosure before work will be allowed to proceed.
 - 3) If the project is of long duration or properly isolated and barricaded, a single work tag at the beginning of the project may be sufficient, at the discretion of the University.
 - b. Enforcement:
 - 1) A breach of the Ceiling / Wall Access Policy will result in a written letter of violation
 - 2) More than three breaches will result in a fine of \$2,500.per occurrence.
 - 3) Violations of Ceiling / Wall Access Policy will affect status as a responsible Contractor for bidding future work.
 - 4) Gross or repeated violations may result in the Contractor may result in termination of the

01 - General Requirements

Contract pursuant to General Conditions, Article 13.2.2.4.

6. Conditions
 - a. Examine work areas and contact the University's Representative and report any difficulties for ceiling access.
 - b. Schedule work in ceiling spaces above occupied rooms in advance.
7. Execution/Installation:
 - a. Ceiling Access: Provide a portable enclosure for each individual ceiling access. Enclose ladder and fit enclosure tight to ceiling and seal around opening. Enclosures must remain in place until all ceiling accesses are closed and the ceiling is secured.
 - b. Portable enclosures must be removed, and ceiling tiles replaced, at the end of each workday. Enclosures cannot be left unattended for more than 30 minutes.
 - c. Ceiling Materials Replacement: Immediately before leaving the work area, replace acoustical tiles and close access panels.
 - d. Thoroughly clean surfaces, which have been exposed to dust with an HEPA-filtered vacuum cleaner or a damp mop.
8. Field Quality Control
 - a. For work within Patient Areas, University may monitor mold count in vicinity of project. Whenever safe levels are exceeded, Contractor will be notified to correct conditions immediately to avoid fine and work stoppage described below.
 - b. All work shall be stopped on the project whenever a hazardous infection control deficiency exists.
 - c. The Contractor shall take immediate action to correct all deficiencies.
 - d. Failure of Contractor to correct such deficiencies will result in corrective action taken by The University and deducting all cost from the contract.
 - e. Before any demolition or construction begins, a complete field review of all Infection Control Policies will be conducted. A checklist will be filled out and signed by the University's Inspector and Contractor confirming that the area is ready for work to begin.
 - f. Photographs will be taken on an unscheduled basis to document violations. Information from Ceiling Access Work Tags will be gathered for the record. A record of Ceiling Access Violations will be maintained.

3.05 STERILE / CLEAN AREAS

- A. All workers entering and leaving sterile / clean areas shall wear new and clean protective suits.
 1. Workers shall not wear protective suits in sterile / clean areas that have been worn within construction areas.
 2. Contractor shall provide clean area within construction site for workers to change into protective suits prior to exiting jobsite and entering sterile / clean areas.
- B. All tools, material and debris shall be covered and sealed while being transported to and from the construction site.
- C. Additional negative air machines may be required to filter circulating air in construction site.
- D. Temporary flooring and floor coving may be required in certain areas.
- E. Prior to constructing barricades in sterile / clean areas, provide a full height polyethylene sheet barrier, minimum 4 mil thickness, tightly taped at edges and along seams, with overlapping flap at least 2 feet wide for access.

3.06 REMOVAL AND RECONDITIONING

- A. At completion of the Work:
 1. Remove temporary structures and services installed as a requirement of the Contract Documents.
 2. Restore utilities to their original condition.
 3. At damaged walls and ceilings, patch and restore finishes to match existing conditions. Where necessary, extend finish restoration to adjoining work in a manner, which will eliminate evidence of patching and refinishing. See Section 01070- Demolition, Cutting and Patching

3.07 CLEANING AND DEBRIS REMOVAL

- A. Completely remove paint, mortar, oils, putty, and materials of similar nature.
- B. Thoroughly clean piping, conduit, and similar items, before painting or other finishing is applied.
- C. Thoroughly clean spaces where work has been performed or used for access to work.
- D. Place 'walk-off' mats inside and outside construction barrier entrances and keep them clean, or replace them as necessary.
- E. Keep barricaded areas in a neat, clean, and dust tight condition at all times. Ensure that adequate workers, cleaning materials, and equipment are always available.
- F. Barricaded areas are subject to un-scheduled inspections to ensure that compliance with cleaning requirement is maintained.
- G. Legally and properly dispose of debris resulting from removal and reconditioning.
- H. Remove debris daily. Removal of debris that must be transported through public corridors, shall occur between the hours of 10:00pm and 7:00am, or as directed by University, and be limited to designated elevators.
 - 1. Debris Containers
 - a. Transport removal of debris in tightly sealed, covered, rubber tired containers.
 - b. Fit containers with clean polyethylene covers completely sealed at perimeters by taping or tying with wire.
 - c. Wipe containers clean before leaving construction area to prevent tracking of dust.
- I. Place covers over debris boxes between periods when they are being filled. Legally and properly dispose of debris resulting from removal and reconditioning operations.
- J. See Section 01710 - Clean-up and Disposal.

3.08 INFECTION CONTROL FORMS

- A. Appendix A – Infection Control Risk Assessment Form (IRCA)
- B. Appendix B – Infection Control Training Form

APPENDIX A

Infection Control Risk Assessment and Mitigation Plan Including Preventive Measures Checklist for Medical Center Construction and Renovation

Instructions for Completing the Checklist

The Risk Assessment and Plan including the Preventive Measures Checklist will be completed during the design planning phase of the construction/renovation project by the multidisciplinary planning group. Infection Control personnel must be involved in each phase of the project to ensure that the appropriate prevention measures are initiated and maintained.

Table A describes the type of construction activity. The type of "Construction Activity" is first identified by selecting the level of activity that best describes the project being planned.

Table B identifies the "Population and Geographic Risk Group" that may be affected by the project because of its physical proximity or potential exposure to the activity.

Table C identifies the appropriate class of infection prevention measures by matching the construction activity with the population risk group. As indicated in Table C, the appropriate dust mitigation measures for the project

01 - General Requirements

are identified. A copy will be reviewed and approved by HEIC and filed by University's Office of Design and Construction or University's Medical Center Facilities Management for all Class III and IV categories. Adaptations to the prevention measures may be made only after approval has been provided by HEIC.

Construction compartment negative air monitoring

A. If required for the project, negative air pressure must be monitored at all times during the duration of the project and documented daily by University's Office of Design and Construction.

B. If positive or neutral air pressure is identified, work must be suspended, barrier investigation must be completed, and negative air pressure restored before resuming work.

→ **A copy of the Infection Control Risk Assessment and Mitigation Plan must be sent to HEIC when matrix indicates Class III or Class IV preventive measures are required.**

Infection Control Risk Mitigation Plan and Preventive Measures Checklist for Construction and Renovation
Appendix A

Project # and Location:	Project Start Date	Estimated Duration:
Project Manager (PM):	Contractor(s):	Infection Control Practitioner (ICP):
PM's phone number:	Contractor's phone number:	ICP's phone number:
Please check the ICRM Plan for the project determined by the ICRA		
CLASS I <input type="checkbox"/>	1. Execute work by methods that minimize generating dust from construction operations. 2. Immediately replace ceiling tile displaced for visual inspection.	3. Immediately remove incidental dust using HEPA vacuum or damp dusting. 4. Clean work area upon completion of task.
CLASS II (includes Class I) <input type="checkbox"/>	1. Obtain infection control permit before construction begins. 2. Provide active means to prevent dust from dispersing into atmosphere 3. Water mist work surfaces to control dust while cutting. 4. Seal unused doors with tape. 5. Air vents may require sealing; consult w/ Facilities Mgmt. 6. Wipe surfaces with disinfectant.	7. Construction workers will vacuum clothes with HEPA Vacuum before leaving work area. 8. Contain construction waste before transport in covered containers. 9. Wet mop and/or vacuum with HEPA filtered vacuum before leaving work area. 10. Place adhesive walk-off mats inside work area (and outside of work area if safety allows). 11. Ceiling or wall access outside construction zone may require separate enclosure (permit required).
CLASS III (includes Class II) <input type="checkbox"/> _____ Initial	1. Seal air vents and Isolate HVAC system in area where work is being done. Consult with project specifications. 2. Complete all critical barriers or implement portable mitigation unit before construction begins. 3. Seal all holes, pipes, conduits and penetrations appropriately. 4. Maintain negative air pressure within work site utilizing HEPA-equipped air filtration units.	5. Do not remove barriers from work area is thoroughly cleaned. 6. Vacuum work with HEPA filtered vacuum 7. Wet mop with disinfectant. 8. Remove barrier materials to minimize dirt and debris. 9. Moisten construction waste before transport in tightly covered containers.
CLASS IV (includes Class III) <input type="checkbox"/> _____ Initial	1. If walls are not full height, exposed wall or ceiling space must be sealed. 2. Construct vestibule and require all personnel to vacuum off in this room using a HEPA vacuum cleaner before leaving work site. Alternatively, they can wear cloth or paper coveralls that are removed each time they leave the work site.	3. Do not remove barriers from work area until completed project is inspected by Design and Construction or Facilities Management representatives and thoroughly cleaned. Remove barrier materials to minimize dust and debris. 4. Upon completion of work, remove isolation of HVAC system in areas where work is being performed. Follow established procedures for re-starting HVAC or water.
_____ Exceptions/Additions to this permit are noted by attached memoranda Date Initials

Table C: Construction Activity and Risk Group Matrix

CONSTRUCTION ACTIVITY→ RISK LEVEL ↓	TYPE "A"	TYPE "B"	TYPE "C"	TYPE "D"
Group 1	Class I	Class II	Class II	Class III/IV
Group 2	Class I	Class II	Class III	Class IV
Group 3	Class II	Class III	Class III/IV	Class IV
Group 4	Class III	Class III/IV	Class III/IV	Class IV

*Designation of Grouping for any location may be changed at the discretion of HEIC

**APPENDIX B
DUST MITIGATION TRAINING SYLLABUS OUTLINE FOR CONTRACTORS**

Welcome to University of California.

Construction/Demolition/Renovation can generate dust and debris that may contain germs that can be transmitted by dust.

- People with healthy immune systems are generally not at risk for dust-related disease.
- Patients can be infected by mold and other germs by breathing in contaminated air.
- UC proudly cares for solid organ transplant patients, bone marrow transplant patients, cancer patients, and other patients with compromised immune system and who are exquisitely susceptible to dust-related disease.
- Dust can cause life-threatening disease in immune compromised patients such as pneumonia or brain infection.

Dust mitigation for Indoor Construction Projects

The extent of the specific measures employed for dust mitigation in a project will depend on the anticipated amount of dust generation, the location(s) of the project, duration of the project and patient populations in the vicinity of the project.

- The contractor and University’s Project Manager will complete a risk assessment.
- Adjacent units managers must be notified of the project and updated when needed.
- Construction barricades must be sealed from floor to underside of floor above.
- When space is available a vestibule will be created adjacent the barricade.
- Barricades will have gasketed door frames; doors with self-closures and OmniLock latching hardware.
- All penetrations into construction areas will be sealed (around piping, windows closed) and air ducts will be capped as determined in the pre-construction meeting.
- Signage with the University’s Project Manager’s name and 24-hour contact information must be posted outside the construction zone.
- Adhesive walk off mats shall be placed inside the construction barricade and outside the barricade door.
- Most projects will require the use of High Efficiency Particulate Air (HEPA) filter units to maintain negative pressure within the construction barricade. The HEPA units will be certified within the last year, contain clean filters, have discharge hoses vented to the outside when possible, and create a negative air pressure within the barricade with door open and an air flow of at least 100 feet per minute at all times.
- A clean jobsite must be maintained. Dust tracked outside the barricade must be removed by wet mop or HEPA vacuum immediately. Debris removal will be performed in clean containers with covers, along a pre-determined route.
- Construction activities outside the barricades require the use of a full height polyethylene sheet barrier, completely taped at the edges and seams. A zipper flap is required for access.

- When ceiling/wall access is required outside the construction barricades, a polyethylene enclosure must be utilized in areas where patients are housed or transported. A ceiling/wall access permit is required and must be obtained from University's Facilities Management Office.
- Construction workers leaving the construction barricades must vacuum the outside of their clothing with a HEPA vacuum or will put on a clean disposable paper suit just prior to leaving the barricade.
- Air sampling may be collected at strategically important locations and times during the demolition and construction phases of projects to assess the effectiveness of dust mitigation at the project site.
- The Department of Hospital Epidemiology and Infection Control (HEIC), Design and Construction and Facilities staff will regularly inspect the project site for adherence to dust mitigation measures. Any breach of compliance with dust mitigation measures may be subject to a fine, as per project specifications.
- All on-site workers involved in any type of demolition, construction, or remodeling work must attend an in-service sponsored by HEIC. Material reviewed includes: reasons for dust mitigation measures during demolition and construction projects in and around the medical center, patient populations served at UC, infectious agents of concern, air sampling for mold spores, and specific measures for dust mitigation. Contractors must retain a list that documents workers who have attended an in-service. This in-service must be completed at least annually.
- The Contractor shall inform all workers on the jobsite-not to enter the University's Medical Center if they suspect they may have a symptomatic illness that could be spread to others.
- Painting activities may involve dust generation (sanding, removing base coving, etc). Evaluate each project per Risk Assessment.
- Floor covering removal may generate dust. Evaluate each project per Risk Assessment.

01 - General Requirements

Dust Mitigation for Major Outdoor Construction Projects

- Windows on units facing outdoor construction must be shut and disabled.
- Signs will be placed on doors leading to outside stairwells that face external construction projects to limit non-emergency traffic.
- University's Facilities Management will monitor air filters. Increased dust generation related to construction may require increased maintenance.
- A letter will be sent by Patient Care Services advising patients and visitors of the disruptions and the hazards of dust.
- The University's Project Manager will inform UC staff via email as to the procedures in place for dust mitigation as well as construction activity schedules.
- All activities that create dust must be continuously hosed down with water.
- Soil must also be kept moist as soil may contain germs that may be aerosolized.
- Loose debris will be moist when loaded for hauling.
- Debris to be hauled away by trucks will be moist and covered prior to hauling.
- Roadways will be free of dirt and washed daily.
- Soil containing *Legionella* may enter plumbing system through cracked pipes. Report any disturbed, cracked or broken pipes to the project manager.
- Contractor will complete a check-list to ensure above dust mitigation measures are performed each day. Any breach of compliance with dust mitigation measures may be subject to a fine, as specified in the project specifications.
- Contractor to cease dust-producing activities if water is not available or if a situation arises leading to uncontrollable dust generation.
- UC HEIC, Design and Construction, and Facilities management staff will regularly inspect the project site for adherence to dust mitigation measures.
- Construction workers working on outdoor projects may not enter the University's Medical Center unless free of dust.
- Air sampling may be completed at strategically important locations during the demolition and construction phases of projects. The purpose of the air sampling is to assess dust mitigation at the project site.
- If deemed necessary by the University's Safety Officer, University's Project Manager, or HEIC, a traffic attendant may be stationed near the project site to direct traffic.
- All on-site construction workers must attend an in-service sponsored by HEIC. Materials to be reviewed include rationale for dust mitigation measures in demolition and construction projects in and around the medical center, patient populations served at UC, infectious agents of concern, air sampling for mold, and specific measures for dust mitigation.
- A "hot line" phone number will be provided to University's staff, patients, and visitors by the University's Project Manager to answer general questions regarding the project.

This guideline is intended for use by UC staff and personnel and no representations or warranties are made for outside use. Not for outside production or publication without permission. Direct inquiries to the Office of Origin.

APPENDIX B

Post Test for Infection Prevention for Construction Personnel

(Circle the best answer: True or False)

1. Dust containing mold and other germs can cause serious illness and even death to some patients.
TRUE FALSE
2. Construction, demolition, renovation and excavation can generate dust containing mold spores and other germs.
TRUE FALSE
3. If you find an injection needle in your work site you should pick it up and throw it out in the garbage.
TRUE FALSE
4. Utility services (water, gas, electric) must not be shut off without approval from Facilities Management, except in an emergency.
TRUE FALSE
5. It is acceptable to leave the work site and enter the hallway if your work clothes are covered in dust.
TRUE FALSE
6. Barriers placed around job sites help to prevent dust from entering patient care areas.
TRUE FALSE
7. Adhesive walk-off mats need to be changed only daily.
TRUE FALSE
8. For large construction projects, HEPA filtered fan units running in the job site are required to scrub the air and create negative pressure.
TRUE FALSE
9. Remove debris using an open container via any route and at times when patients are present.
TRUE FALSE
10. During outdoor demolition soil and debris should be kept dry.
TRUE FALSE
11. Air sampling during construction and demolition can help determine if Infection Control measures for dust control are working.
TRUE FALSE
12. All on-site construction workers must attend an Infection Control in-service. This in-service must be completed at least annually.
TRUE FALSE
13. Workers who are sick with a cold, flu or other communicable illness should not enter the center.
TRUE FALSE

Print Name: _____ Signature: _____ Date: _____

Project #: _____ Contractor or Company Name: _____

**ORIGINAL TESTS MUST BE GIVEN TO FACILITY ENGINEERING
AND COPIES RETAINED ON SITE BY CONTRACTOR**

APPENDIX B

Prueba Posterior de Prevención de Infección para el Personal de Construcción. (circule la mejor respuesta: Verdadero o Falso)

- 1. El polvo que contiene moho y otros germenos puede causar serias enfermedades y aún la muerte a algunos pacientes.
VERDADERO FALSO
- 2. La construcción, demolición, renovación y excavación pueden generar polvo conteniendo esporas de moho y otros gérmenes.
VERDADERO FALSO
- 3. Si usted encuentra una aguja de inyección en su sitio de trabajo debería recogerla y tirarla a la basura.
VERDADERO FALSO
- 4. Servicios de utilidad (agua, gas, electricidad) no deben ser apagados sin aprobación de la Administración de la Instalación , excepto en una emergencia.
VERDADERO FALSO
- 5. Es aceptable abandonar el sitio de trabajo y entrar al recibidor si su ropa de trabajo está cubierta de polvo.
VERDADERO FALSO
- 6. Las barreras puestas alrededor del sitio de trabajo ayudan a prevenir la entrada del polvo a las áreas de cuidado del paciente.
VERDADERO FALSO
- 7. Las colchonetas adhesivas necesitan ser cambiadas sólo diariamente.
VERDADERO FALSO
- 8. Para Proyectos de construcción grandes, las unidades de HEPA de ventilacion con filtros funcionando en el área de trabajo son requeridas para limpiar el aire y crear presión negativa.
VERDADERO FALSO
- 9. Remover los escombros usando un contenedor abierto vía cualquier ruta y en momentos que los pacientes estén presente.
VERDADERO FALSO
- 10. Durante la demolición exteriors, la tierra y escombros deben ser mantenidos secos.
VERDADERO FALSO
- 11. Muestreo de aire durante la construcción y demolición puede ayudar a determinar si las medidas de control de Infección para control del polvo están funcionando.
VERDADERO FALSO
- 12. Todos los trabajadores en el sitio de la construcción deben asistir a una clase de Control de Infección. Este clase debe ser completado al menos en forma anual.
VERDADERO FALSO
- 13. Trabajadores que esten resfriados, tengan influenza u otra enfermedad contagiosa no deberían entrar al centro médico.
VERDADERO FALSO

ORIGINAL TESTS MUST BE GIVEN TO FACILITY ENGINEERING AND COPIES RETAINED ON SITE BY CONTRACTOR

END OF SECTION 01 10 00 00

SECTION 01 10 00 00a - UNIVERSITY OCCUPANCY AND WORKING HOURS

PART 1 GENERAL

1.01 SECTION INCLUDES

- A. Section references Normal and Restricted Working Hours in which various types of work is allowed to be performed, in accordance with Project location and conditions.

1.02 RELATED SECTIONS

- A. Section 01010 - Summary of Work
- B. Section 01310 - Contract Schedule

1.03 DEFINITIONS

- A. Working Hours: Assume work will be performed during Normal Working Hours, 6:00 a.m. to 6:00 p.m. except where noted or specified as Restricted Working Hours.
- B. Occupied Rooms or Occupied Areas: Defined as space outside of construction barricades, including public corridors, site staging areas and elevator lobbies.

1.04 PROJECT CONDITIONS

- A. See Infection Control.

1.05 SCHEDULING SHUTDOWNS

- A. Work in occupied areas, or work above, or below, ceiling spaces, or adjacent to occupied areas, is to be done during Restricted Working Hours and are to be scheduled a minimum of 14 calendar days in advance with the University's Representative. To request a shutdown complete and submit Facilities Impact Request Form at end of this section.
- B. Interruption of Building Services and Life Safety Shutdowns are to be done during Restricted Working Hours and are to be scheduled a minimum of 14 calendar days in advance with the University's Representative.
- C. Emergency Shutdown, call University's Representative.
- D. Shutdowns outside the project area shall be held to a minimum but not more than four (4) hours.
- E. Coordinate shutdowns closely with University's Representative. Operation of existing valves, switches, or other means to affect shutdown, will be by University Facilities.

1.06 RESTRICTED WORKING HOURS

A. Hospital

The following work shall take place Monday through Friday 5:00 PM to 10:00 PM and 6:00 AM to 8:00 AM or as scheduled. Saturday and Sunday shall be scheduled as "after-hours" with minimum 72 hour advance notice.

ACC

The following work shall take place Monday through Friday 6:00 PM to 6:00 AM or as scheduled. Saturday and Sunday shall be scheduled as "after-hours" with minimum 72 hour advance notice.

MTZ

The following work may take place Monday through Friday 6:00 PM to 6:00 AM as scheduled with minimum 72 hours notice. Saturday and Sunday shall be scheduled as “after-hours” with minimum 72 hour advance notice.

Alternately at MZ:

The following work may take place Monday through Friday during normal working hours as scheduled at the request of Facilities dependent on impact. Saturday and Sunday shall be scheduled as “after-hours” with minimum 72 hour advance notice.

1. Before commencing with the work, verify the following Restricted Working Hours **activities and scope** with the University's Representative:
 - a. All work activities which occur within occupied areas below, above or adjacent to, the Project Area.
 - b. All connections to utility services which require shutting down active building utility services.
 - c. Debris Removal via hospital's service elevators.
 - d. Jackhammering, sawcutting, coredrilling or rotohammer work in concrete, drilling into floor and ceiling slabs and exterior concrete walls for placing anchorages, and all other work considered extremely "noisy activities".
 - e. Erecting and Removing Barriers.
 - f. Equipment deliveries which would disrupt vehicular or pedestrian traffic.
 - g. Small equipment deliveries which would not disrupt vehicular or pedestrian traffic: Normal Hours.
 - h. Work in Public Corridors and Elevator Lobbies.
 - i. Use of open air radios not allowed

PART 2 PRODUCTS (NOT USED)

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 11 00 00 - SUMMARY OF WORK

PART 1 GENERAL

1.01 PROJECT NAME AND IDENTIFICATION

Project Name:

1.02 WORK REQUIRED BY CONTRACT DOCUMENTS

- A. Work includes, but is not necessarily limited to, the following:
1. Asbestos Abatement
 2. Demolition, Cutting & Patching.
 3. General Remodeling Construction.
 4. New Flooring and Paint.
 5. Modifications to Mechanical, Plumbing and Electrical Systems.
 6. Upgrade Construction for Fire and Life Safety

1.03 SUMMARY OF WORK

{PROJECT SUMMARY}

1.04 APPLICATIONS OF THE CONTRACT DOCUMENTS

- A. Provisions of the General Conditions of the Contract, Supplementary Conditions, and Division 1 - General Requirements of the Specifications, apply to the work specified in each Section of the Specifications.
- B. Contractor is hereby specifically directed to notify and apprise all subcontractors and other parties engaged in the Work as to Contents of the General Conditions of the Contract, Supplementary Conditions, and Division 1 - General Requirements.
- C. No contractual adjustment shall be due or become exigent as a result of failure to fully understand the General Conditions of the Contract, Supplementary Conditions, and Division 1 - General Requirements.
- D. CCR: A copy of Title 24 shall be available on the job site at all times.
- E. OSHPD Jurisdiction: Projects under the jurisdiction of the Office of Statewide Health Planning and Development (OSHPD) will follow regulations and approvals set forth in Section 01080 - Regulatory Requirements in addition to the requirements referenced in the General Conditions of the Contract and the Specifications.

1.05 SUBMITTALS

- A. The following Division 1- General Requirements and Division 2- Site Work specifications require submittals:
1. Section 02080 - Asbestos Removal
 2. Section 01110 - University Interim Life Safety
 3. Section 01310 - Contract Schedules
 4. Section 01340 - Shop Drawings, Product Data and Samples
 5. Section 01400 - Quality Control
 6. Section 01565 - Hazardous Materials Procedures
 7. Section 01640 - Product Options and Substitutions
 8. Section 01700 - Project Closeout
 9. Section 01740 - Guarantees, Warranties, Bonds Service and Maintenance Contracts

1.06 SCHEDULES

- A. The following specifications require the submittal of Schedules:
1. Section 01310 - Contract Schedules

01 - General Requirements

2. Section 01340 - Shop Drawings, Product Data and Samples

1.07 CONTRACTOR'S USE OF UNIVERSITY'S SITE

- A. General: Limit use of the premises for work of this Project to allow for University's occupancy and use by the public.
- B. Use of Site: Confine operations at the Site to areas permitted under the General Conditions of the Contract. Portions of the Site beyond areas of work of this Project are not to be disturbed.
- C. Access: Keep existing driveways, roads and entrances serving the premises clear and available to the University at all times. Do not use these areas for parking or storage of materials.

1.08 VERTICAL TRANSPORTATION

- A. For material deliveries, a service elevator or stair will be designated to be available to Contractors on a scheduled basis with specific hours. Construction personnel may use other service and passenger elevators or stairs with no material or equipment deliveries allowed. The University elevators are very congested. Prolonged use by the Contractor shall be after normal business hours. The contractor shall protect the elevators during temporary use. Contractor shall repair or replace any damaged components of the system. Contractor shall clean up after use. Service Elevators are to be used for all material or equipment delivery. Personnel may use Passenger elevators most convenient to the job site. The University's elevator access policy shall be strictly enforced.
 - 1. Patients and staff are to be granted priority to elevators at all times.
 - 2. The transport of tools, boxes, material and debris shall be limited to the use of service elevators whenever possible.

1.09 SITE DECORUM

- A. Contractor shall control the conduct of its employees so as to prevent unwanted interaction initiated by Contractor's employees with University employees, visitors, and other individuals. Without limitation, unwanted interaction would be whistling at or initiating conversation with passerby. Further, Contractor shall control conduct of its employees as to prevent inappropriate conversations and use of inappropriate language on the job site. In the event that any Contractor employee initiates unwanted interaction or is heard in an inappropriate conversation or using inappropriate language, Contractor shall, whether upon request of University's Representative or on its own initiative, replace said employee with another of equivalent technical skill, at no additional cost to the University.

1.10 SMOKE FREE CAMPUS POLICY

- A. As a health sciences institution dedicated to promoting health and healing, and to providing a safe and healthy environment for its patients, visitors, students, faculty and staff, the University of California has adopted a Smoke Free Campus Policy. The UC Smoke Free Campus Policy applies to the Campus and all other UC facilities regardless of location. Smoking is prohibited on University-owned or leased property, buildings, vehicles and moving equipment. Smoking is prohibited within 20 feet of entrances and exits of public buildings and outside any operable windows. Failure to comply with the Smoke Free Campus Policy will result in a fine of \$100.00 for each violator and each occurrence.

1.11 PARKING ACCESS

- A. Access to the University's site on campus roads shall be arranged between Contractor and University's Representative. Contractor's entrance to the building of the Project Area will be limited to locations designated by the University's Representative.

- B. Parking will not be available in University's Garages for vehicles belonging to Contractor's personnel.

- C. Vehicle Emissions

All engines must be in good working order, dark smoke 3 minutes after start up is in violation.

Equipment standing idle for more than 5 minutes must be turned off. (Except rotating drum concrete trucks.)

All contractor diesel powered construction equipment with engine horsepower (HP) ratings of 50 HP and above, that are on the project and in use for a period in excess of 40 hours shall be retrofitted with Emission Control Devices and/or use Clean Fuels in order to reduce diesel emissions. In addition, all motor vehicles and/or construction equipment shall comply with all pertinent State and Federal regulations relative to exhaust emission controls and safety, including the anti-idling law if Gross vehicle weight is more than 10,000 pounds. The reduction of emissions of carbon monoxide (CO), hydrocarbons (HC), nitrogen oxides (NOx), and particulate matter (PM10) will be accomplished by installing Retrofit Emission Control Devices or by using less polluting Clean Fuels.

The Retrofit Emission Control Devices shall consist of oxidation catalysts, or similar retrofit equipment control technology that (1) is included on the Environmental Protection Agency (EPA) *Verified Retrofit Technology List* or CARB verified list and (2) is verified by EPA/or CARB or certified by the manufacturer to provide a minimum emissions reduction of 45% PM10, and 25% NOx.

The Clean Fuels shall consist of low NOx and PM10 emission diesel fuel that (1) can be used without engine modification, (2) is certified to provide a minimum emissions reduction of 45% PM10 and 20% NOx when compared to No. 2 Diesel Fuel, and (3) is included on the California Air Research Board (CARB) Verification List.

Construction shall not proceed until the contractor submits a certified list of the diesel powered construction equipment that will be retrofitted with emission control devices or that will use Clean Fuels. The list shall include

- (1) the equipment number, type, make, year and contractor name;
- (2) the emission control device make, model and EPA verification number; and/or
- (3) the type and source of fuel to be used.

The contractor shall submit summary reports, updating the same information stated above, and include certified copies of the clean fuel delivery slips for the report time period, noting which vehicles received the fuel. The addition or deletion of diesel equipment shall be included on the monthly report.

1.12 EXISTING PROJECT CONDITIONS

- A. Examination: Specifications and Drawings show existing structures, waste lines, hot and cold water lines, gas, electrical, mechanical, chilled water, and other utilities which are known to the University and are as accurate as possible but not guaranteed. Verify locations, levels, dimensions and features that may affect the Work. Existing installations shall be kept in service where possible. No allowance will be made in Contractor's behalf for extra expense resulting from failure or neglect in determining conditions under which Work is to be performed, or in Contractor's interpretation of information provided.
- B. Record Survey: Prior to commencing the Work, Contractor and University's Representative shall tour the Project Area together to examine and record damage to existing adjacent areas and improvements. This Record shall serve as a basis for determination of subsequent damage due to the Contractor's operations and shall be signed by all parties making the tour. Any cracks, sags, or damage to the adjacent areas, and improvements not noted in the original survey, but subsequently discovered, shall be reported to University's Representative. Repairs of damage caused by the course of work will be made by the Contractor at no expense to the University.
- C. If any structure or utility is damaged, take appropriate action to ensure the safety of persons and property. Report any such incidents to the University's Representative immediately. Maintain the existing building in a safe and weathertight condition throughout the construction period.

1.13 SECURITY PROVISIONS

- A. Provide security and protection services and systems in coordination with activities and in a manner adequate to achieve 24-hour, 7-day-per-week effectiveness.
- B. If any hazardous material is encountered during construction, notify University immediately.
- C. Work Area Enclosure and Lockup: At earliest possible date, secure work area against unauthorized

entrance at times when personnel are not working.

D. Smoke detector protection is described in Section 01520 - Fire Safety.

1.14 CONTRACTOR SAFETY

A. Contractor shall comply with all applicable safety requirements including, but not limited to, EH&S General Safety Update instructions. A copy of these instructions follows Section 01011- General Requirements, and is to be prominently posted at the construction site.

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION-NOT USED

END OF SECTION 01 11 00 00

SECTION 01 11 00 00a - UNIVERSITY INTERIM LIFE SAFETY

PART 1 GENERAL

1.01 SUMMARY

- A. University's Interim Life Safety Measures (ILSM) are a series of administrative actions required to be taken to temporarily compensate for the hazards posed by construction activities. This serves to ensure proper protection of University employees, patients and visitors against fire, the by-products of fire and fire related emergencies and to comply with local, state, and federal codes, laws and requirements of accrediting agencies. The ILSM program is directed to new construction, renovations and existing Life Safety Code deficiencies within University buildings.

1.02 REFERENCES

- A. 2009 JCAHO Standards
- B. NFPA 101, Life Safety Code
- C. CCR Title 8, Section 1922

1.03 PROCEDURE

- A. University's Interim Life Safety Measures shall be implemented when ever life safety features are compromised for 4 hours or longer. Each Interim Life Safety Measure action must be documented. Primary responsibility for individual items is as noted following each of the 6 ILSM's Policies and Procedures detailed below. ILSM's include, but are not limited to the following:
 1. SITE EVALUATION: Questions shall be answered specifically for the project. Any affirmative response shall be considered as a condition that triggers implementation of ILSM.
 2. CAMPUS FIRE MARSHAL RESPONSIBILITIES: Campus Fire Marshal shall meet with University's Representative to review the project scope and ILSM procedures applicable prior to the start of construction.
 3. UNIVERSITY'S REPRESENTATIVE: University's Representative shall be responsible for all activities involved with the construction area, will ensure strict adherence to the ILSM by the contractor and will act as liaison with University staff and personnel associated with the ILSM.
 4. CONTRACTOR'S RESPONSIBILITIES: Contractor shall diligently adhere to the ILSM. Contractor shall diligently adhere to the Facilities Management Jobsite Book. Copies can be requested at the Facilities Management Office, Parnassus Room L-210 and Mount Zion Room A-06.
 5. STAFF RESPONSIBILITIES (OCCUPANTS IN AND/OR ADJACENT TO CONSTRUCTION AREA): Staff shall be aware of compromised building conditions and adhere to the ILSM.
 6. UNIVERSITY'S FACILITIES: University's Facilities shall be advised of every construction project and its implemented ILSM.

1.04 QUALITY ASSURANCE

- A. University's Security personnel will be informed of pending construction work by the University's Representative, and will be present during discussion of ILSM's at the Preconstruction Meeting.
- B. Discussion of ILSM's shall be documented in the meeting minutes.
- C. Life Safety Systems Shutdowns: Requests for approval for shutdowns of life safety systems must be submitted to the University's Facility Engineer by the contractor in writing before shutdown is desired as described in Section 01044 - University Occupancy and Working Hours. University's Facilities Management/Building Management is responsible for conducting shutdowns of life safety systems.
- D. The University's Representative will document the training of personnel in ILSM's by the Campus Fire Marshal.
- E. The University's Representative and Campus Fire Marshal will inspect construction areas and document

01 - General Requirements

violations and remedies of the ILSM's using the ILSM's Violation Report and Notification Form provided with this Section.

- F. The University's Representative and University's Infection Control Officer will complete a Risk Assessment (RA) and Preventive Measures Checklist (ICRA) to ensure appropriate controls.

1.05 ENFORCEMENT

- A. Enforcement of ILSM's will be documented by the University's Representative with the use of the Interim Life Safety Measures Standard Operating Programs for Construction Areas which include Policy and Procedures and Exhibits, provided with this Section.

- 1. Interim Life Safety & Infection Control Measures, Standard Operating Programs for Construction Areas

Policy No. 1- Project Evaluation

Policy No. 2- Interim Life Safety Measures will be coordinated with and supervised by the Campus Fire Marshal (CFM)

Policy No. 3- The University's Project Manager has specific responsibility for assuring that all ILSMs are implemented throughout the project.

Policy No. 4- The Contractor is legally bound by the terms of the contract to implement and continuously maintain the Interim Life Safety Measures.

Policy No. 5- Staff in areas adjacent to construction shall be kept informed of the construction activities, will be briefed on the ILSM, and provided training on temporary exit protocols and emergency procedures.

Policy No. 6- Center Facilities

Exhibit #1- Project Risk Assessment Plan

Exhibit #2- Project Risk Management Plan

Exhibit #4- Infection Control & ILSM Signoff Sheet

Exhibit #5- Contractor Drill Test Procedures

Exhibit #6- Violation Report and Notification Form

Exhibit #7- Hot Work Permit

INTERIM LIFE SAFETY & INFECTION CONTROL MEASURES

STANDARD OPERATING PROGRAMS

FOR CONSTRUCTION AREAS

University's Interim Life Safety & Infection Control Measures (ILSM) are a series of administrative actions required to be taken to temporarily compensate for the hazards posed by construction activities.

Implementation of the ILSM is required in or adjacent to all construction areas. ILSM apply to all personnel: designers, project managers, installation technicians and construction workers. ILSM are a required component of every project, and as such are to be incorporated into the design documents by the design professional and are bid/contracted to the construction contractor. ILSM will be continuously enforced from contractor mobilization through completion of any construction project.

The ILSM are intended to provide a level of life safety comparable to that described in 2009 JCAHO Standards, the applicable occupancy chapters of the 2000 edition of the Life Safety Code (NFPA 101) and CCR Title 8, Section 1922. ILSM are to be instituted anytime an area is going to be compromised. Each ILSM action must be documented.

Six (6) separate Policies and Procedures are outlined herein and identified in detail are the assigned responsibilities for determination of implementing the Interim Life Safety Measures program. Included are seven (7) Exhibits that shall serve as documentation of the outlined ILSM program.

INTERIM LIFE SAFETY & INFECTION CONTROL MEASURES

POLICIES AND PROCEDURES

POLICY NO. 1 PROJECT EVALUATION

After the contract specified ILSMs are in place, but prior to starting construction, the University's Project Manager (PM) will inform the Campus Fire Marshal (CFM), the University's Safety Officer and the University's Director of Facilities about the project impact on fire & life safety systems. The PM will brief the group on all of the ILSMs that are documented in the Contract Drawings and then a walkthrough will occur to evaluate whether contracted measures are sufficient or if additional measures are required. The PM and University's Safety Officer will conduct a Project Control Risk Assessment plan (PCRA) and a Project Control Risk Management plan (PCRM). The PM will obtain sign off. The PM will retain documentation in the ILSM file for review.

The Contractor is required to participate in the assessment, implementation, monitoring and enforcement of the plans. Contractor participation may include training of construction workers, supplying specialized equipment to create and maintain safe environmental conditions, monitoring construction staff behavior, enforcing work practices and maintaining diligent assurance of all necessary records and documentation.

INTERIM LIFE SAFETY MEASURES

POLICIES AND PROCEDURES

POLICY NO. 2 Interim Life Safety Measures will be coordinated with and supervised by the Campus Fire Marshal (CFM)

The Campus Fire Marshal is designated by the State of California with the authority and responsibility to uphold the building code requirements for a fire and life safe environment.

PROCEDURE:

At the ILSM meeting the University's Project Manager (PM) will provide a briefing to the CFM and the following documentation:

- Project location, scope, start date.
- Schedule of construction activities
- Identification of Project Representatives from Contractor, University, staff occupants, adjacent staff occupants. (Project Directory)
- Proposed temporary impacts or modifications to means of egress and/or building separations.
- New rating assemblies and their location of installation.
- Proposed impacts on Fire Alarm System. Schedule of when area is planned to be off-line, and provisions for temporary systems if applicable. Code upgrades or new additions to system. Schedule for final testing and certification of new / modified systems.
- Proposed impacts to fire suppression system. Schedule of when areas is planned to be off-line. New sprinkler installation plan. Schedule for final testing and certification of new / modified system.
- Information on any hazardous materials to be utilized during construction

For the duration of the Project the CFM will provide the following services:

- CFM to approve Hot Work Permits and periodically inspect condition of contractor-provided fire fighting equipment.
- CFM to enforce free and unobstructed access to emergency services and for emergency forces.
- If path of egress is changed or obstructed during the course of construction, CFM to conduct one extra local fire drill per shift, per quarter.
- Conduct staff training when egress or compartmental features of fire safety are compromised.
- Discuss CFM organized safety education programs that ensure staff awareness of Life Safety Code deficiencies located in vicinity of the construction area and any construction hazards.
- Enforce a Fire Watch when a situation presents a hazard to life or property as result of construction or when the fire protection equipment/ system has been rendered inoperable.
- A Building Log of all Inspection/Testing Reports of temporary Life Safety Systems will be conducted by Fire Safety Office and copied to the CFM.
- In case of Fire Watch, CFM shall notify the local fire department.
- The Contractor shall conduct monthly inspection and testing of temporary systems installed in or adjacent to all construction area and send copies to the CFM.
- CFM shall be aware, per PM notification received, of impending construction work, and shall increase hazard surveillance of buildings, grounds, and equipment with special attention to excavations, construction areas, construction storage and field offices.

INTERIM LIFE SAFETY MEASURES

POLICIES AND PROCEDURES

POLICY NO. 3 The University's Project Manager (PM) has specific responsibility for assuring that all ILSMs are implemented throughout the project.

The University's Project Manager (PM) shall be responsible for oversight of all activities involved with the defined construction area or associated with the project. The PM will enforce strict adherence to the ILSM by Contractor and will act as the liaison with University's staff and personnel associated with ILSM.

PROCEDURES:

- PM will inspect means of egress in construction areas.
- PM will ensure free unobstructed access to emergency facilities adjacent to construction areas.
- PM shall confirm with Contractor, that the fire alarm, detecting, and suppression systems are not impaired. PM will report immediately to the CFM any situations that impair these systems.
- PM shall inspect, during erection, that temporary construction partitions are smoke tight and built of noncombustible materials.
- PM shall inform Contractor of smoking prohibition in all areas of the Facilities Center.
- PM shall ensure that Contractor is responsibly storing materials in and adjacent to construction area, and that Contractor is cleaning and removing debris from construction area in accordance with specifications.
- University's Inspector of Record (IOR) shall inspect all infection control measures daily and verify contractor compliance
- PM will notify the University's Hospital Building Manager, and University's Facilities Management of impending construction work that takes place outside of the approved construction area.
- PM will ensure, through notification of Contractor, that hazardous conditions inside the construction area are corrected in a timely fashion.
- PM shall be responsible for distribution and posting of construction alert notices when temporary interruptions affecting life safety codes must be made.
- PM in conjunction with the CFM, will document violations and remedies of the ILSM using the ILSM Violation Form provided herein. Exhibit No. 6.
- IOR shall record all applicable ILSM for the project construction area per the Periodic IOR Site Inspection Report, Exhibit 3.
- PM shall schedule a Fire Watch, when required by the CFM.

INTERIM LIFE SAFETY MEASURES

POLICIES AND PROCEDURES

POLICY NO. 4 The contractor is legally bound by the terms of the contract to implement and continuously maintain the Interim Life Safety Measures.

Contractor shall diligently adhere to ILSM defined in the Contract Documents.

Contractor shall diligently adhere to the University's Facilities Management Jobsite Book. Copies can be requested from the Facilities Management Office.

Responsibilities shall be contractually assigned to all tier subcontractors.

PROCEDURES:

1. Contractor shall ensure that exits provide free and unobstructed egress, for areas adjacent to and within the construction area, at all times.
2. If alternate exits are designated, Contractor shall provide or modify directional exit signs as necessary for alternate exits.
3. Contractor shall maintain escape facilities for construction workers at all times.
4. Contractor shall not block or impede access to emergency facilities.
5. Contractor shall ensure that existing fire alarm, detecting, and suppression systems are not impaired during progress of construction, unless such activity is cleared with the University's Project Manager (PM) and Campus Fire Marshal (CFM) and appropriate mitigation measures are put into place.
6. Contractor shall provide an approved, temporary but equivalent system when any fire system is impaired.
7. Contractor shall provide non-combustible, smoke tight partitions with smooth and clean surfaces.
8. Contractor shall obtain a Hot Work Permit from the CFM at the beginning of the job for any welding or brazing activities, and abide by the terms and conditions of that permit.
9. Contractor shall provide additional fire fighting equipment to assure equivalent fire protection in construction area while existing fire detecting and suppression systems are impaired.
10. Contractor shall ensure that all construction employees are prohibited from smoking in or adjacent to all construction areas within university buildings.
11. Contractor shall ensure that storage of materials within and adjacent to the construction area is kept at minimum level necessary for daily construction activities.
12. Contractor shall clean and remove debris from construction area daily.
13. Contractor shall ensure that hazardous conditions inside the construction area are minimized.
14. When structural or compartmental features of fire safety are compromised, the Contractor shall be responsible for training employees of compromised conditions.
15. Contractor shall distribute written requests for shutdowns of life safety systems to University's Hospital Building Management and copy to University's Project Manager.
16. Contractor shall conduct testing of the temporary fire alarm system on a monthly basis and copy the CFM.

INTERIM LIFE SAFETY MEASURES

POLICIES AND PROCEDURES

POLICY NO. 5 Staff in areas adjacent to construction shall be kept informed of the construction activities, will be briefed on the ILSM, and provided training on temporary exit protocols and emergency procedures.

PROCEDURES:

1. The University's Project Manager (PM) shall notify staff of pending construction activity (Construction Alert Notices), that identify the extent of affected area, hours of construction activity, describes the expected impacts and has contact information for the University's Project Manager.
2. Staff personnel shall be trained when means of egress or compartmental features of fire safety are compromised due to construction. The PM shall provide personnel a briefing of alternate exits, and post signage to ensure visual direction of exit.
3. Emergency Exiting Map shall be updated or modified to reflect interim egress.
4. The Campus Fire Marshal (CFM) will brief staff on the care and function of alternate fire alarm devices.
5. The CFM shall train all staff in the use of fire extinguishers.
6. Staff shall participate in scheduled fire drills for designated areas where Interim Life Safety Measures are being implemented.
7. Staff personnel shall be available for educational programs offered by the Campus Fire Marshal, that emphasize awareness of Life Safety Code violations, construction hazards and the Interim Life Safety Measures.

INTERIM LIFE SAFETY MEASURES

POLICIES AND PROCEDURES

POLICY NO. 6: CENTER FACILITIES

University's Facilities shall be advised of every construction project and its implemented ILSM, and has the responsibility for ILSM as required for any utility shutdown.

PROCEDURES:

- Facilities shall attend scheduled Preconstruction Meeting.
- Facilities shall be aware, per University's Project Manager (PM) notification received, of impending construction work, and shall increase hazard surveillance of buildings, grounds, and equipment with special attention to excavations, construction areas, construction storage and field offices.
- Facilities shall notify the Campus Fire Marshal (CFM) and University's Safety Officer of ILSM violations reported and verified by personal knowledge. PM shall correct identified violation.
- Facilities shall evaluate, coordinate and schedule all utility system shutdowns and building access requests. MCF will notify CFM whenever a fire & life safety system is shutdown, and implement any interim safety measures required.

**CAMPUS EMERGENCY NUMBER 9-911
OR FOR FIRE, USE FIRE ALARM PULL STATION
FIRE SAFETY REQUIREMENTS**

1. The location where the work is to be done has been personally examined:

- A. Sprinklers, where provided, are in commission and will not be taken out of service. Campus Policy.

- B. Fire extinguishers of an approved type are easily within reach. CFC Section 4901.9.
- C. Visible hazard identification signs shall be provided such signs shall display the following warning: Caution – Hot Work in Progress – Stay Clear. CFC Section 4901.10.
- D. Hot work shall not be conducted in rooms or areas where flammable liquids or vapors, lint, dust or combustible storage is at risk of ignition from sparks or hot work. CFC Section 4901.5.2.
- E. All work will be confined to the area or equipment specified in the permit. Campus Policy

2. Equipment used has been examined:

- A. Only the approved equipment (blowpipes, torches, regulators, acetylene generators) that have been tested and are safeguarded as much as is practical area in use. CFC Section 4901.7.
- B. Any personnel using equipment have been properly trained for its specific used. Campus Policy.

3. If work is within 10 feet of combustible construction or material:

- A. Noncombustible shields must be used. CFC Section 4901.5.3.
- B. A fire watch must be kept during welding or cutting and for at least ½ hour after completion of cutting or welding operations to detect and extinguish smoldering fires. CFC Section 4901.4.

4. Special precautions:

APPENDIX A - Abbreviations & Definitions	183

HAZARDOUS MATERIAL ASSESSMENT

02 26 00

- A. The University Representative can provide the most updated and/or project specific lead and asbestos abatement requirements, if any. Any variation from UC Davis Health's Standard Specifications must be reviewed and approved by UC Davis Health Environmental Health & Safety (EH&S). Records must be maintained for addressing protocols, monitoring, record keeping and manifesting of the waste.
- B. Numerous other hazardous materials are found on the UC Davis Health campus and will be identified and addressed by the University Representative. These may be chemical, radiological, or biological and include, but are not limited to: mercury found in traps, drains and sumps and fluorescent light tubes; PCBs found in light ballasts, transformers, freons found in refrigerators and other refrigeration units, batteries found in smoke alarms and radioactivity found in exit signs, smoke detectors and as potential contamination in labs, radon, etc.
- C. Prior to any significant earthmoving or grading activities, soil sampling shall be conducted by a thirdparty to determine if naturally occurring asbestos (NOA) is present. Review Division 01 for specific sampling requirements. The sampling may take place at the same time as the geotechnical work, if required. If NOA is found at the site by method CARB 435, all site work must be conducted in accordance with the California's Air Resources Board's Asbestos Airborne Toxic Control Measure (ATCM) standards. Results shall be provided to the University Representative.
- D. All hazardous materials must be disposed of in strict accordance with Federal, State, and UC DavisHealth disposal requirements. Refer to project specific Geotechnical Report and Division 01.

DEMOLITION 02 41 00

When demolishing buildings up to six stories in height, all exterior surfaces of the building shall be wetted during demolition. Coordinate with the University Representative for all demolition projects located in areas with highly sensitive air quality or infection control requirements.

CONCRETE

03 00 00

- A. Concrete Finishes
 - 1. Concrete finishes are reviewed on a project-by-project basis for quality and visual consistency. UC Davis Health seeks designs that unify UC Davis Health campus 'neighborhoods' in visual character and intuitive way-finding. The consistency of finishes and visual relationship to adjacent buildings are reviewed for contextual appropriateness.
 - a. Interior and exterior architectural concrete at locations where appearance is prominent, requires formwork design submittals

and material mock-ups for review and approval by the University Representative.

- b. Forms that are to be reused shall be carefully inspected after each use to ensure that they have not become damaged, distorted, disassembled, or otherwise be unable to perform as designed. Concrete forms and formwork shall remain leak-proof for each use.
- B. Quality Assurance
1. A quality assurance program shall be developed and implemented in accordance with the requirements of the CBC.
- C. Project Conditions: Reference ACI (American Concrete Institute) standards
1. Hot-weather concreting that includes production, delivery, placement, curing and protection of concrete shall be in accordance with ACI 305.
 2. Cold-weather concreting that includes production, delivery, placing, curing and protection of concrete shall be in accordance with ACI 306.
 - a. Use of calcium chloride as an accelerating admixture is prohibited.
 3. Method of concrete curing shall be in accordance with ACI 308 and based upon the type of floor finishes and environmental conditions.
 - a. Curing compounds shall not be used on surfaces that are meant to receive additional concrete, paint, or tile that requires a positive bond, unless it has been demonstrated that the membrane can be satisfactorily removed before the subsequent application is made, or that the membrane can serve satisfactorily as a base for the later application.
 - b. Where finished flooring is to be installed over the curing compound, the Contractor shall test the compatibility of the mastic/adhesive from the flooring with the curing compound prior to applying the curing compound.
 - c. Items described above shall not be subjected to rusting or other deterioration.
- D. Slabs on Grade
1. Excessive moisture in concrete can cause adhesion problems with flooring materials installed over concrete slabs, especially slabs on grade. Implement precautionary moisture control measures to ensure there will not be adhesion problems, deterioration, or other conditions that will limit the expected life span of the flooring or void the material and installation warranties or the warranties of adjacent installations.
 2. At interior slabs to receive flooring, provide a minimum 15 mil under-slab vapor barrier. Project-specific requirements may supersede or require greater moisture mitigation measures.
 3. Review the geotechnical soils report for each project and confirm recommendations.
- E. Design of Floor Slabs in Wet Areas
1. In restrooms, showers, locker rooms, mechanical rooms above first floor, or other areas subject to flooding or wash down, slabs shall be constructed with integral 6" curbs at perimeter and interior walls. Integral waterproofing system required unless otherwise approved by the

University Representative. Wet labs shall be provided with sleeves that extend 4" above the floor to prevent the migration of water down

to the floors or under the slab on grade. Sleeves shall be sealed watertight.

CAST-IN-PLACE CONCRETE

03 30 00

A. General Requirements

1. Concrete shall be designed and detailed to meet all applicable CBC requirements, including requirements for structural strength, stability, short- and long-term deformation and fire resistance.
2. Concrete elements shall also be designed for serviceability, including specific consideration of long-term deformations, crack control, durability of both concrete materials and other building components embedded in or in contact with concrete materials and vibration.
3. Concrete used in buildings, including slabs-on-grade, shall have a minimum compressive strength, f_c , of at least 3,000 psi at 28 days. Higher strength concretes are permitted.
4. Concrete floors shall be designed to provide satisfactory vibration performance for each space type to achieve optimum performance for both occupant comfort and the operation of vibration-sensitive equipment, where applicable. Vibration performance shall be reviewed and confirmed in early design phases.
5. Concrete roof slabs, including concrete slabs placed on metal deck, shall be designed to support the weight and seismic mass of one (1) re-roofing without removal of the original roofing.
6. Concrete roof slabs, including concrete slabs placed on metal deck, shall be designed to support the weight and seismic mass of a rooftop photovoltaic array in all areas of the roof not occupied by other equipment of rooftop structures.
7. Clearly indicate requirements for crack control joints or other crack control measures in all concrete construction following recommendations by the American Concrete Institute (ACI), the Concrete Reinforcing Steel Institute, and other relevant industry standards.
8. Avoid thin concrete sections and unreinforced projections that could crack or spall over time. All concrete sections shall be reinforced.
9. Show all slab openings, depressions, curbs, and pads on structural drawings, clearly indicating reinforcing requirements and provisions for maintaining minimum structural section depth at all locations.
10. Show openings and penetrations through concrete walls and through or below concrete footings on structural drawings. Include locations of penetrations for pipes, conduits, ducts and other building components on drawings.
11. Provide requirements for shoring, reshoring, concrete pour joints and pour sequencing at all locations where these construction means and methods affect the short- or long-term structural performance or finished aesthetics of the construction.

12. Provide structural details that include scaled representations of all reinforcing steel including rebar configurations and other embedded items in enough detail to ensure constructability of the element including consideration of at least the following: constructability of formwork, flow of wet concrete through rebar and other embedded items.
13. Concrete placed in contact with soil shall be designed and specified for long-term durability in consideration of such soil-related effects as sulfate exposure, permeability of concrete, corrosivity and expansion potential of soils.

PRECAST ARCHITECTURAL CONCRETE

03 45 00

- A. Precast concrete may be used for exterior walls and other areas if approved by the University Representative. Construction of precast concrete will require tight tolerances to be maintained and double waterproofing at joints and seams. Mockup of precast panels shall be approved at the plant where the panel is manufactured.
 1. Precast architectural concrete elements and their anchorage to the building frame or foundations shall be designed by a licensed California Structural Engineer considering all gravity and environmental loads. Should this design be performed by an engineer other than the Structural Engineer of Record (SEOR) of the building, the SEOR shall review all pre-cast concrete details and calculations for conformance with the design intent, including loads imposed on the structure, deformation compatibility (both vertical and lateral) with the structure, and coordination between precast elements, their connections and other structural and non-structural building components.
 2. Precast architectural elements that are attached at more than one floor level or that attach to other building elements, including other pre-cast concrete elements shall be designed to accommodate the maximum inter-story displacement between floors. This requirement applies to both vertical (gravity) deflection and lateral (seismic and/or wind) drift between floors.

MASONRY

04 00 00

- A. General
 1. For masonry finishes, where masonry is exposed to the exterior, utilize integral water-repellent admixtures in lieu of surface applied sealers. Use graffiti-resistant coatings where feasible to protect exposed finishes. Verify requirement for graffiti-resistant coating with the University Representative prior to specifying.
 2. Seal exposed masonry and control joints inside and out before additional wall finish materials are applied. Pretest all surface-applied sealants and coatings by mock-up when integral admixtures are not used.
- B. Protection and Storage During Construction

01 - General Requirements

1. Protect all masonry materials including packaged mortar materials, sand and related materials from weather conditions such as rain, snow, ice, etc. All materials for any project shall be kept in a manner consistent with the manufacturers' requirements and warranties.
 2. Protect unfinished masonry from the elements a minimum of two feet on all sides. Do not apply construction loads that exceed the safe superimposed load capacity of the masonry.
- C. Quality Assurance
1. A quality assurance program shall be developed and implemented in accordance with the requirements of the CBC.
 2. Establishment of the required compressive strength (f'm) of masonry shall be in accordance with CBC.
- D. Grouted Masonry
1. All cells in the masonry units shall be fully grouted. Prior to grouting, clear the masonry cells of extraneous materials, mortar projections greater than ¼ inch, mortar droppings and other foreign materials.
 2. Low-lift and high-lift grouting construction shall be in accordance with the CBC. High-lift grouting has the potential for block blow-out during grouting. Repair all blowouts during grouting procedures.
- E. Embedded Conduits, Pipes, and Sleeves
1. Conduits, pipes, and sleeves of any material to be embedded in masonry shall be compatible with masonry and meet the following requirements
 - a. Design shall consider the structural effects resulting from the removal of masonry to allow for the placement of pipes or conduits and shall not displace more than 2% of the net crosssection.
 - b. Conduits, pipes, and sleeves in masonry shall be no closer than three (3) diameters on center.
 - c. Do not embed pipes that contain liquid, gas, or vapor at temperatures greater than 150 degrees F, water or liquids that are subject to freezing, or under pressure in excess of 55 psi. Do not embed any pipes that may require future maintenance or reconfiguration.
- F. Project Conditions
1. When ambient air temperature is below 40 degrees F, implement cold weather procedures in ACI (American Concrete Institute) 530.
 2. When ambient air temperature exceeds 100 degrees F or exceeds 90 degrees F with a wind velocity greater than 8 mph, implement hot weather construction as instructed by ACI 350.

CONCRETE UNIT MASONRY

04 22 00

A. General

1. Where CMU is exposed to view, utilize integral admixtures for

water resistance, graffiti-resistance, etc. Verify requirement for graffiti-resistant coating with the University Representative prior to specifying.

2. Design and detail CMU to meet all applicable CBC requirements, including requirements for structural strength, stability, short- and long-term deformation, and fire resistance. Design CMU for serviceability, including specific consideration of crack control, and durability of both CMU wall materials and other building components embedded in or in contact with the CMU walls
3. CMU wall and wall opening dimensions shall be multiples of base CMU block unit dimensions to minimize cut masonry material, to the greatest extent possible.
4. Clearly indicate requirements for expansion joints, crack control joints or other crack control measures in all building and site CMU wall construction following recommendations by the American Concrete Institute, the Concrete Reinforcing Steel Institute, The Masonry Society, The Concrete Masonry Association of California and Nevada and other relevant industry standards.
5. Show all openings and penetrations through CMU walls on structural drawings. Include locations of penetrations for pipes, conduits, ducts and other building components.
6. Maximum reinforcing bar size in CMU construction shall be #8.
7. All cells in CMU construction shall be fully grouted.

MASONRY VENEER

04 26 00

A. General

1. Masonry Veneer require Water/Graffiti Resistance
 - a. Where concrete facing brick is exposed to view, utilize integral admixtures for water resistance, graffiti resistance, etc.
 - b. Where face brick is exposed to view, utilize compatible topical coatings for water resistance, graffiti resistance, etc.
2. Masonry wall and wall opening dimensions shall be multiples of base masonry unit dimensions to minimize cut masonry material to the greatest extent possible.
3. Clearly indicate requirements for expansion joints, crack control joints or other crack control measures in all building and site masonry wall construction following recommendations of the Brick Industry Association (BIA) and other relevant industry standards.
4. Show all openings and penetrations through masonry walls on structural drawings. Include locations of penetrations for pipes, conduits, ducts, and other building components.
5. Masonry
 - a. Standard: Comply with TMS 602, except as modified by project requirements.
 - b. Defective Units: Do not use defective units that comply with

referenced standards where such defects will be exposed in the completed work.

6. Adjustable Masonry-Veneer Anchors: Provide anchors that allow vertical or horizontal adjustment but resist tension and compression forces perpendicular to plane of wall.
7. Do not use calcium chloride in mortar or grout.

METALS

05 00 00

A. General

1. Metal fabrications are required to be detailed and coordinated with adjacent materials to ensure installation does not have long-term maintenance requirements. Steel may be exposed when approved by the University Representative.
2. All metals exposed to an exterior environment (including prefabricated items such as steel doors or stairs) require a protective finish coating. Exposed metals may be either factory-finished with a corrosion and sulfate-resistant finish, stainless steel, hot-dip galvanized, or finished with a high-performance coating.
3. Architecturally Exposed Structural Steel (AESS) compliant mockup is required for all projects. The University Representative has the right to waive this requirement for smaller scopes of work as desired.
4. Interior metal shall be primed painted to a minimum thin-film thickness of two mils unless described in the respective project as unpainted. Some members or portions thereof may be designated as unpainted. Examples may represent metal that will be in contact and acting compositely with concrete and / or members that are to receive spray-applied fire protection materials.
5. All materials shall be identified with appropriate ASTM designations and fabricator's identification mark. Materials without minimum specification, or under a specification that is less rigorous than the applicable ASTM standard or without certified mill test reports shall not be used without the approval of the University Representative.

B. Quality Control

1. A quality assurance program shall be developed and implemented in accordance with the requirements of the California Building Code

STRUCTURAL STEEL FRAMING

05 12 00

A. General

1. Structural steel shall be designed and detailed to meet all applicable C.B.C. requirements including but not limited to requirements for

strength, stability, deformation, and fire resistance. Steel systems shall also be designed for serviceability, including specific consideration of deflection, durability, and vibration.

2. Steel framed floors shall be designed to meet the vibration requirements for occupant comfort as described in Design Guide 11, latest edition, published by the American Institute of Steel Construction (AISC) as a minimum standard requirement. More stringent performance requirements shall be determined as needed per project-by-project type and specifically related to vibrationally-sensitive equipment requirements.
3. Steel-framed roofs shall be designed to support the weight and seismic mass of one re-roofing without removal of original roofing.
4. Steel-framed roofs shall be designed to support the weight and seismic mass of a rooftop photovoltaic array in all areas of the roof not occupied by other equipment or rooftop structures.
5. Steel framing supporting concrete-filled metal decks shall be designed to accommodate any

excess weight or mass caused by over-pouring as may be needed to provide a slab meeting the project floor flatness and levelness requirements, taking into account deck and supporting beam pre-composite deflections and beam camber.

6. Structures shall be designed to accommodate the dimensional changes of steel material caused by temperature changes.
7. Exterior steel elements shall specify a material thickness of at least 1/4".
8. All details that include connections of steel to other materials shall include provision for field adjustment or leveling, including but not limited to base plate connections to foundations and steel beam/ledger connections to concrete and masonry walls.

METAL DECKING

05 30 00

A. General

1. As standard use minimum 18-gauge deck.
2. Metal decking below concrete slabs shall be vented to promote consistent concrete curing.
3. Metal deck supported concrete slabs shall be designed to accommodate any excess weight or mass caused by over-pouring as may be needed to provide a slab meeting the project floor flatness and levelness requirements, taking into account deck and supporting beam pre-composite deflections.
4. Acoustical metal deck may be considered in exposed conditions when there is an acoustical concern. The specific type of deck shall be determined by the Acoustical Engineer to meet project requirements and approved by the University Representative.
5. Coordinate openings in metal decking with each design discipline. The cutting and reinforcing of openings will require SEOR review and confirmation adjacent areas are not negatively affected. Reinforcement executed by welding will need to comply with the American Welding

Society (AWS) current requirements.

6. Requested modifications or any deviations of any metal decking originally specified for a project, such as vented decks, needs to be brought to the attention and reviewed by the SEOR and approved by the University Representative.

STRUCTURAL METAL STUD FRAMING

05 41 00

A. General

1. Provide metal stud types designed for screw application of gypsum wallboard. Studs shall be fabricated by a manufacturer that belongs to the Steel Stud Manufacturers Association (SSMA) and shall meet requirements of the latest edition of the International Code Council Evaluation Service (ICC-ES) Evaluation Report #3064P.

B. Metal Studs

1. Provide ASTM C645, non-load bearing type with punched webs; roll formed electro galvanized steel sheet in the following gages
 - a. 20ga (33 mil) typical framing (non-OSHPD projects).
 - b. 16ga (54 mil) typical framing (OSHPD projects).
 - c. 16ga (54 mil) for king and trimmer studs at door/window openings and wing wall ends.

METAL FABRICATIONS

05 50 00

A. General

1. All provided metal fabrications will need to comply with the current C.B.C. and ASTM specifications applicable to these fabrications. Laboratory test results will need to be provided to confirm compliance with each project's specifications. All steel grades will need to be reviewed and confirmed for each project and for each use type. Steel tubing, piping, bolts, bars and woven wire meshes may require galvanization prior to installation. Field cut edges will need treatment applied if protective coatings are damaged or removed by the field installation process.
2. Dissimilar metals will need separation when in contact or in close proximity to non-compatible metals. Anchor bolts that fasten through metal fabrications shall be stainless steel.

METAL STAIRS

05 51 00

A. Stairs

1. Design by SEOR or review by SEOR for compliance to design loads for all interior monumental stairs.

2. UC Davis Health's standard is metal stair fabrication with concrete-filled pan treads. Stair design and fabrications are both functional and aesthetic. Designs should create a "finished" appearance, to encourage use of all stairways serving the public (including egress stairs).
3. At a minimum, all soffits at stairs and landings shall conform to current code-required vertical clearances to the bottom of the finished soffit. Exposed metal fabrication is discouraged. Use of metal treads is NOT permitted, unless approved by the University Representative due to special circumstances for non-public use. Special focus should be paid to adequate coefficient of friction for safe walking surface.
4. Provide contrasting strip at EVERY tread, to assist in visual acuity for navigating risers. UC Davis Health has standardized contrasting risers, regardless of stair type or location (applies to indoors, outdoors, public, private and egress stairs).
5. Coordinate floor finishes to extend from adjacent service area into landing at each stair. Provide finished materials at stairwells.
6. Stair design to comply with current C.B.C. requirements. The preferred rise and tread combinations are (6 1/2", 11 5/8") and (6 3/4", 11 1/4").
7. Stair fabrications require shop drawing review.
8. Provide at least one stairwell up to a roof containing air handling units, pumps, boilers, large exhaust fans and other equipment. (Ships ladders are not acceptable, unless approved by the University Representative under special circumstances).
9. Walkway canopies, handrails, guardrails and similar assemblies should discourage climbing, skateboarding, roller-blading and similar nuisance activities.

METAL RAILINGS

05 52 00

A. General

1. Exterior guardrails and handrails shall be stainless steel or hot dipped galvanized steel with bolted connections. For both stainless steel and hot dipped galvanized, use SS316 bolts and mechanical fasteners at railing connections. Painted finishes are discouraged, as they do not stand up to heavy use and require regular ongoing maintenance. Interior handrails may be stainless or have a painted finish, with the approval from the University Representative.
2. Nonwelded connections that use mechanical fasteners require fasteners to be of the same metal and finish as the railings. Material compatibility is required for supporting brackets, flanges, fittings, anchors, and inserts. When selecting non-welded fasteners, special attention to dissimilar metals is required. Where possible, use fasteners of the same material as metal fabrication, stainless steel, or provide neoprene separation between dissimilar metal s.
3. Where railings are sheared or punched, surfaces shall be cleaned, and edges eased to a radius of 1/32." Design weep holes and water-directing devices into the system to prevent entrapment of water in assemblies.

- B. Handrail extension, weather top of stair or bottom of stair shall be measured to the near side / insidematerial diameter to handrail extension material thickness meets or exceeds code minimum extension relative to stair tread.
- C. When selecting and documenting grab bars, provide the next longer size, particularly at side reach, to ensure that code minimum reach range are met (for example in lieu of 42" select 48").

DESIGN CRITERIA

06 00 00

A. General

- 1. Use of wood in UC Davis Health buildings is generally limited to casework and rough carpentry. Due to the lack of durability and a high degree of maintenance involved with exterior uses, wood is discouraged for most project types on the UC Davis Health campus.
 - a. Engineered wood systems can be considered for strategies to reduce embodied carbon footprint in new construction.
 - b. CLT or panelized wood systems will be considered on a project-specific basis for appropriateness and with approval from the University Representative.
- 2. Provide wood products conforming to the Forest Stewardship Council Guidelines for certified wood building components.
- 3. For use in building interiors, composite wood and agrifiber products (including core materials) shall not contain added urea formaldehyde resins. Adhesives used in field and shop-fabricated assemblies containing these products shall not contain urea-formaldehyde.

ROUGH CARPENTRY

06 10 00

A. General

- 1. Form release agents used on wood concrete forms shall be biodegradable to enable the wood to be recycled.
- 2. Provide preservative-treated wood in conjunction with roofing (nailers, curbs, etc.) and for any wood in contact with masonry, cement or the earth. Provide material safety data sheets for all wood preservative for review and approval by the University Representative and EH&S.
- 3. Provide plywood backboards with a minimum 3/4" fire treated CDX for all wall-mounted boxes and boards in mechanical or electrical rooms. Alternate support details for boxes and boards will be considered on a project-by-project basis and with approval by the University Representative. Each project will need to confirm use of rough carpentry for compliance of each project's construction type.
- 4. Provide products that have Health Product Declaration (HPDs) and Environmental Product Declarations (EPDs) available.

5. Wood construction used to support structural loads shall be designed and detailed to meet all applicable structural provisions of the CBC including all requirements for strength, stability, short- and long-term deformation, and fire resistance. Wood elements shall also be designed for serviceability, including specific consideration of durability wood and connector materials.
6. Lumber grading rules and wood species shall conform to Product Standard PS - 20 -70 and West Coast Lumber Inspection Bureau (WCLIB) requirements.
7. Wood-framed roofs shall be designed to support the weight and seismic mass of one re-roofing without removal of the original roofing.
8. Wood-framed roofs shall be designed to support the weight and seismic mass of a rooftop photovoltaic array in all areas of the roof not occupied by equipment or other rooftop structures.
9. Wood stud walls and partitions adjacent to shower or toilet rooms or a room with other similar sources of water shall bear on concrete curbs extending at least 6" above finished floor.
10. Exterior wood walls shall bear on concrete curbs extending at least 6" above finished floor.
11. Use 6" minimum nominal framing for all structural wood stud walls.
12. Provide specific details to describe the conditions that allow wood studs and plates to be notched or cored for piping and conduit within walls.

FINISH CARPENTRY

06 20 00

A. General

1. Materials, workmanship and installation shall be "Premium Grade" in accordance with Woodwork Institute's Architectural Woodwork Standards, current edition.
2. Wood fabricated from old growth timber is not permitted. Provide sustainably harvested wood, certified or labeled.
3. Where feasible, shop finish carpentry and casework fabrication, rather than site finish.
4. Wood shall be pressure-treated and/or fire-resistant, where required by CBC or other applicable codes.
5. Avoid wood finishes in locations that are subject to high traffic, or impact damage.

ARCHITECTURAL WOODWORK

06 40 00

A. General

1. The UC Davis Health encourages the use of modularity and systems furniture in place of built-in casework for uses such as, nurses' stations, reception desks, etc. The flexibility and reconfiguration possible by use of modular design allows adaptability as space needs and workflow changes.

2. For built-in woodwork, materials, workmanship and installation shall be "Premium Grade" in accordance with Woodwork Institute's Architectural Woodwork Standards, current edition.
- B. Countertops
1. General use, non-laboratory and non-sink locations
 - a. Corian countertops.
 2. Non-laboratory, sink locations
 - a. Solid surface material or stainless steel.
 - b. Sink installations shall be top mount.
 3. Laboratory Refer to Section 12 35 53 Laboratory Casework for additional requirements
 - a. Material: Solid surface epoxy resin, phenolic resin, or other equivalent solid material. Plastic laminate countertops shall not be used.
 - b. Casework shall be resistant to heat, chemical, impact, and bacteria; provide manufacturer's data.
 - c. Install drop-in epoxy sinks with color matched silicone for easy sink replacement.

DESIGN CRITERIA

07 00 00

- A. General Design Requirements: The principles and criteria in this division are critical in developing thermal and moisture protection designs that will prevent serious problems over time.
1. Roof access ladders and stairways to roof shall not be alternating tread type.
 2. Provide 18-gauge sheet metal flashing at roof locations that are accessible to building occupants to prevent damage and vandalism.
 3. All rooftop-mounted equipment shall be mounted on platforms (curbs). Coordinate curb heights with top of roofing elevations so that minimum base flashing heights and roof warranties are maintained.
 4. All platforms (curbs) shall be a minimum of 8" in height from the finished roof surface. Walk pads shall be provided from roof access points to and around all rooftop equipment. Walk pad installation shall be fully adhered to roofing to avoid restricting storm water pathway to drains. Walk pads shall be installed with 1" gap and between walk pad placement and valley lines.
 5. All conduits and piping shall be elevated to a 4" minimum height and all conduit and piping supports shall be from a manufactured composite rubber base pipe support system. No pipe supports may breach roof warranties. Additional roof membranes or coatings may be necessary at pipe support locations.

6. Below-grade foundation walls, retaining walls, above-grade concrete or masonry planters, and any other structures subject to hydrostatic pressure shall receive an appropriate waterproofing system. Perimeter drainage shall be equipped with cleanouts located in planter areas for future maintenance.
7. Each building design shall be carefully analyzed to locate conditions that require waterproofing, including retaining walls, basement walls, on-grade slabs, plaster walls, elevator pits and any other sub-grade conditions where the passage of water can create a problem.
8. For renovation projects: When rooftop equipment is removed and not replaced in the roof area, all associated components shall be removed as well, including the complete removal of any curbs, supports, piping, conduits, electrical lines, blocking, etc. All roof areas touched by this removal shall be patched and repaired to maintain all existing warranties.

DAMPPROOFING AND WATERPROOFING

07 10 00

Provide testing and inspection as required by Air Barrier Association of America standards. ICC- ES AC38 -Acceptance criteria for Water-Resistive Barriers. Refer to ICC-ES AC148 Acceptance Criteria for Flexible Flashing Materials

SHEET WATERPROOFING

07 13 00

Prior to installation of any product below grade, all areas shall be clean and have an approved primer applied per manufacturer's specification. All non-exposed areas shall be a minimum of 60mil self- adhering sheet, composed of butyl rubber-based adhesive, and backed by a layer of protection board, separating it from contact with soil or other damaging elements.

WATER REPELLENTS

07 19 00

- A. All exterior exposed masonry and concrete (that will not be receiving additional finish) shall be treated with a clear, penetrating water repellent.
- B. Concrete masonry units with integral dry block additives do not require additional waterproofing sealers.

ROOFING AND SIDING PANELS

07 40 00

- A. All metals used shall be prefinished Zinalume/Galvalume sheet metal or G-90 galvanized steel in minimum 24 gauge as described in ASTM A792.
- B. Underlayment shall be compatible with metal systems to protect structure from water and moisture intrusion and be resistant to melting in high temperature conditions.

METAL ROOF PANELS

07 41 13

A. General

1. Standing seam roofing system shall consist of integral self-locking seams with a minimum seamheight of 1 ¾". Standing seam roofing system shall have no exposed fasteners. Panels shall have clips designed to allow for thermal expansion and contraction. Design metal roof system to accommodate both wind load and any future PV system or infrastructure, to be confirmed by the University Representative.
2. Use a minimum of 30lb felt underlayment or 30-mil roof underlayment or better. All underlayments at metal roof shall have a high-heat performance capability. For special applications, consult the University Representative. Sealants shall be gunnable grade singlecomponent polyurethane caulk or gunnable grade butyl. Tape Sealant shall be Butyl.
3. The completed metal roof and flashing assembly shall be capable of withstanding expansion and contraction of components caused by changes in temperature without buckling; producing excess stress on structure, anchors or fasteners; or reducing performance ability. System design shall not rely on deformation of any element to allow for expansion/contraction.
4. Manufacturer shall provide a standard 35-year coating performance warranty. All installations shall be in accordance with specified manufacturer guidelines.

THERMOPLASTIC MEMBRANE ROOFING

07 54 00

A. General

1. Tri-Polymer Alloy (TPA) Single-Ply Membrane Roofing System (SMR) is the standard thermoplastic membrane roofing system for low-sloped applications. Thermoplastic Olefin (TPO) membranes are NOT approved.
2. Single Ply Membrane Roofing (SMR) systems shall be fully adhered or mechanically fastened and qualify for a UL Class A Roof Covering with Factory Mutual 1-90 Windstorm Classification

as needed to meet the current code requirements for the ultimate design wind speed designated for the building classification. The SMR system shall be covered by the material manufacturer's 20- Year Total System warranty covering all roofing components installed above the roof deck upon completion and acceptance of work.

3. Roof systems shall comply with NRCA (National Roofing Contractors Association) Roofing and Waterproofing Manual, current edition. Designs shall provide minimum roof slope of ¼ inch per foot, including valleys at crickets. Provide greater slopes if possible.
4. All roofing systems shall meet ASTM standards per their respective systems. Roofing materials shall meet ASTM D4434, minimum 60 mil thickness and have a Solar Reflectance Index (SRI) as required below for a minimum of 75 percent of the roof surface. (Product shall meet

current CA Title 24 Requirements for reflectivity.)

Roof Type Slope SRI Low-Sloped Roof :5 2:12 78

Steep-Sloped Roof > 2:12 29

5. For special applications, consult the University Representative. All installations shall be in accordance with manufacturer recommendations.
6. Materials and adhesives shall be selected to comply with UC Davis Health Sustainability Initiatives, Code, and performance standards while also being no- or low-VOC.

FLASHING & SHEET METAL

07 60 00

At all areas, base flashing shall extend 8" minimum above the highest point of the roof system and be continuous and level all around the entire perimeter of the roof. Roofs shall generally have a spring - lock counter flashing to accommodate future re-roofing without destroying the balance of metal flashing system. Designs shall conform to SMACNA standards (Sheet Metal and Air Conditioning Contractor's National Association).

ROOF SPECIALTIES AND ACCESSORIES

07 70 00

- A. This applies to all roof hatches that are in addition to the minimum required (one per stair to roof).
- B. Roof Hatches
 1. Standard roof hatch size is 30" x 36" inches. Roof hatches that are larger than the standard size shall require hydraulic or spring-loaded hinges. Special applications or sizes shall be reviewed and approved by the University Representative.
 2. Roof hatches shall be designed to comply with Cal OSHA Title 8 Section 3212 and to provide safe egress and ingress through roof and access hatches.
 3. Roof hatches shall be designed such that opening and closing of the roof hatch can be done with three points of contact on the ladder at all times.
 4. Consideration shall be given for the safe exit and approach to the hatch and ladder. The roof hatch shall be located such that there is sufficient clear space directly in front of the ladder at the roof level. Shop drawings shall be reviewed with the University Representative prior to construction.
- C. Where buildings don't provide a roof hatch, an exterior fixed ladder that complies with Cal OSHA Title 8 section 3277 shall be provided.
- D. Lighting at the roof hatch shall be no less than 5' candles, switched in the room.

ROOF FALL PROTECTION

07 72 60

A. General

1. All areas that expose workers to a fall of 6' or greater shall be protected by parapet walls or permanent guardrails that comply with Cal OSHA Title 8 section 3209. When guardrails or parapets are not feasible, provide one of the following:
 - a. Horizontal Lifelines as part of a complete fall arrest system that is compliant with Cal OSHA Title 8 section 1670 designed by a "Qualified Person" as defined by ANSI/ASSE Z359.0-2007-2.109.
 - b. Anchorages that comply with Cal OSHA Title 8 section 1670 as designed by a "Qualified Person" as defined by ANSI/ASSE Z359.0-2007-2.109.
 - c. All fall protection systems shall comply with Federal OSHA and Cal OSHA Title 8 requirements, of which the most stringent shall apply.
2. Whenever possible, projects shall be designed in such a way that specialty equipment and/or personal protective equipment shall not be required for fall protection.
3. Compliance may be a combination of 42" parapets, guardrails or low-profile anchorage points. No exceptions shall be made unless authorized by the University Representative.
4. When an alternative fall protection system is agreed by the University Representative, the project shall strictly adhere to the following requirements for all permanently installed fall protection equipment, including anchors, horizontal lifelines, vertical lifelines, fall arrest, restraint, or positioning, ladder safety systems, and other active fall protection systems in accordance with the latest revision of the ANSI 359.6 Standard.

B. Design Requirements

1. Identify where fall protection is required and review with the University Representative on all projects are required.
2. Define the type of fall protection system being designed (fall arrest, restraint or positioning).
3. Shall meet CAL OSHA requirements.
4. Provide dedicated fall protection drawings showing the layout of the system.
5. The structural engineer shall provide calculations for the following
 - a. Minimum required strength of anchorages
 - b. Sizes and minimum breaking strengths
 - c. Maximum arrest load (MAL)
 - d. Maximum loading on all components demonstrating that the fall protection equipment/system will meet the lb.-f requirements as designed and defined in Table 1 below
 - e. Detail drawing and additional requirements to meet the project needs. 1). Provide necessary

specification

- 2). Require Contractor to provide shop drawing and calculations.
- 3). Fall protection design can be a deferred submittal. Consult with the University Representative to identify submittal requirements.

C. Installation Requirements

1. Identify fall protection systems (*i.e.*, anchors, horizontal lifelines, vertical lifelines, fall arrest, restraint, or positioning, ladder safety systems, and other active fall protection systems).
2. Provide documentation illustrating ANSI Z359.6 compliance.
3. Demonstrate compliance with design requirements.
4. Show number of workers and provide minimum/maximum forces the system is designed to support in the event of a fall to include the following
 - a. Maximum arrest force (MAF)
 - b. Deployment of energy absorbers
5. Provide the manufacturer, make/model and serial numbers of all system components being installed.
6. Provide shop drawing with supporting details and calculations.
7. Provide for horizontal lifelines to include the following data
 - a. Sag, deflections, elongation and fall arrest
 - b. Harness effect and D-ring slide
 - c. Temperature impacts
 - d. Clearance requirements given these factors.
8. Provide additional items to meet ANSI and project specific requirements for acceptance.
9. Provide the manufacturer's instructions for inspection and maintenance. Verify whether the system requires installation by certified installers.
10. Certify compliance with ANSI Z359.6 and submit certification for acceptance.

JOINT SEALANTS

07 92 00

A. General

1. All materials used shall be top-of-the line available and suited for the conditions being sealed while also in compliance with the following VOC requirements. Comply with current CAL Green Chapter-4 requirements.
2. Generally, horizontal joints shall be made watertight by mechanical connections. Sealants shall be used on vertical joints.
3. Limit width to depth ratio of 2:1 with maximum hourglass depth of

0.375 inch and provide sealant backer. Sealants shall be compatible with the materials and the expected movement where they are being applied.

- B. Fire and Smoke Protection
 - 1. Systems and products shall be tested and approved by Underwriter's Laboratories in accordance with applicable codes. Fire-stopping and smoke-stopping materials are subject to approval of the UC Davis Health's Fire Marshal and shall carry a UL Listing.

METAL DOORS AND FRAMES

08 11 00

- A. Door sizes shall be based upon functional use. Standard sizes are listed below. Door widths and heights may exceed these minimums with approval from the University Representative.
 - 1. 36" wide when serving staff employees.
 - 2. 42" wide when serving public access.
 - 3. 48" wide when serving hospital gurneys or beds.
 - 4. The door height standard is 7'-0" typical but may be modified for project specific requirements.
- B. Doors Type: The standard for doors is SDI (Steel Door Institute) Level 2 Heavy Duty, shop primed, 1-³/₄" thickness. Door reinforcing for hardware to per ANSI / SDI A250.6 typical.
- C. Frames
 - 1. Projects requiring OSHPD approval
 - a. Extra Heavy Duty. Fully welded with mortar boxes for all hardware. Frames for all exterior openings and interior openings that are 4' wide or wider shall be 14-gauge steel. Interior frames shall be 16-gauge steel with hospital stops. Exterior frames shall be galvanized.
 - 2. Educational and Office-Buildings
 - a. Interior Knock-down (KD) type included with mortar boxes for all hardware. 18-gauge steel with applied casing.
 - b. Exterior doors are 14-gauge galvanized Extra Heavy Duty fully welded with mortar boxes for all hardware.
 - 3. For remodel projects confirm with the University Representative on whether to match existing building standards or modify for newer standards.
- D. Door/Sidelights
 - 1. Door vision lights shall be a minimum 6" x 24" at all double, dual egress, and single doors where door swing could cause injury.
 - 2. Sidelights are encouraged at doors to offices, classrooms, and general-purpose

rooms.

E. Door Protection

1. Doors subject to high traffic of carts, equipment, and other items that could damage the doorsurface shall have a 48" high by full door width stainless steel or polyethylene terephthalate glycol (PETG) armor plate. Plate shall be included as part of certification labeling.
2. Doors subject to medium traffic and wheelchair use shall have a 12" high x full door width stainless steel or PETG kick plate. Plate shall be included as part of certification labeling.

F. Door Labeling / Certification

1. All doors and frames shall have rating labels from Underwriters Laboratory or Warnock Hersey. Provide recertification for altered doors and frames.
2. Fire rated glazing assemblies shall be used at rated wall openings for fixed windows or glazing in rated doors.

WOOD DOORS

08 14 00

A. General Information

1. Wood doors should generally only be used for light duty areas such as offices, conference rooms, and cross-corridor doors on hold-open devices. Wood doors shall be permitted only with approval from the University Representative.
2. Wood doors to comply with or exceed Woodwork Standards Section 9 for premium grade wood doors. Selection of wood doors shall consider fire rating requirements.
3. When closers are used that may conflict with the maximum opening force of 5 lbs. per the CBC, auto door openers shall be considered. Wood doors shall not be used for exterior conditions.

B. Door/Sidelights

1. Door vision panels shall be a minimum 6" x 24" at all double, dual egress, and single doors where door swing could cause injury.
2. Sidelights are encouraged at doors to offices, classrooms, and general-purpose rooms.

C. Door Protection

1. Doors subject to high traffic of carts, equipment, and other items that could damage the doorsurface shall have a 48" high by full door width stainless steel or polyethylene terephthalate glycol (PETG) armor plate. Plate shall be included as part of certification labeling.
2. Doors subject to medium traffic and wheelchair use shall have a 12" high x full door width stainless steel or PETG kick plate. Plate shall be included as part of certification labeling.

D. Door Labeling/Certification

1. All doors and frames shall have rating labels from Underwriters

Laboratory or Warnock Hersey. Provide recertification for altered doors and frames.

2. Fire rated glazing assemblies shall be used at rated wall openings for fixed windows or glazing in rated doors.

SPECIALTY DOORS AND FRAMES

08 30 00

A. Fiberglass Reinforced Polyester Doors

1. Fiberglass reinforced polyester (FRP) doors are recommended for use in areas with excessive moisture or corrosives. Core material shall be foam urethane with a minimum of 5 lb/ft³ density, free of chlorofluorocarbons (CFC) and hydrofluorocarbons (HCFC). Color shall be permanently bonded through the full thickness of the fiberglass door faces.

B. Door & Frame Sizes

1. Door frames subject to excessive and consistent moisture or corrosives shall be fabricated of 304 stainless steel. Refer to Design Guidelines Section 08 11 00 for frame requirements.

C. Access Doors

1. Access doors and panels shall be factory primed and painted. At wet areas, doors and panels shall be stainless steel. Doors shall be secured by either screw turn or key lock. Minimum size to be 24" x 24". Rated access doors shall be selected to meet wall or ceiling construction rating typical.

COILING DOORS

08 33 00

A. General

1. Loading dock doors shall be overhead coiling, electric motor operated with manual opening device for use in case of power or motor failure.
2. If overhead or coiling doors/grilles are used in public spaces special consideration is required for lockdown procedures and emergency function.

ENTRANCES, STOREFRONTS AND CURTAIN WALLS

08 40 00

A. Aluminum Doors

1. Aluminum and glass entrance doors shall be constructed with wide stiles and top rails with 1/4" hardware reinforcement and insulated glazing. Finish shall be clear anodized or high performance (Kynar or equal) color coated. Colors and finishes shall be reviewed by the University Representative.
2. Minimum acceptable component dimensions

- a. Metal thickness: 3/16"
- b. Head rail size: 6-1/2" x 1-3/4"
- c. Stile size: 5-1/2" x 1-3/4"
- B. Bottom rail size: 12-1/2" x 1-3/4"
- C. Storefronts and Curtainwalls
 - 1. Storefront and Curtainwall systems shall be a minimum nominal size of 6" x 2" and accommodate a minimum of 1" insulated glazing units. Systems shall be designed for structural, wind and seismic requirements which may require larger nominal system profiles.
 - 2. Finishes shall be selected from the manufacturer's premium finishes. Consult the University Representative prior to selecting custom colors or finishes.
- D. Warranty: Provide a full product ten-year warranty at no extra cost covering materials, installation, and workmanship for repair or replacement due to defects; warrant against air and water infiltration from any source.
- E. Provide set-up for window/curtain wall washing.

AUTOMATIC ENTRANCES

08 42 29

- A. General
 - 1. Provide automatic doors at main entries and entry floor-level restrooms of every new building on the UC Davis Health campus.
 - 2. The preferred type of automatic door is non-telescoping, by-pass, sliding type. Automatic doors shall be activated by hardwired interior and exterior push pads at two (2) levels or vertical bar type actuators. Both upper and lower push device shall activate the door operation.
 - 3. At specific employee and emergency entry doors, operation may be sensors, radio frequency remote control (for handheld transmitter), card access or a preferred combination reviewed and approved by the University Representative.

ALUMINUM WINDOWS

08 51 13

- A. General
 - 1. When operable windows are selected, sensor shall be installed connecting to the BMS. Finishes shall be clear anodized or high performance (Kynar or equal) color coating.
 - 2. All aluminum frames shall be thermally broken and accept a minimum of 1" dual glazed window pane.

DOOR HARDWARE

08 70 00

- A. Door hardware shall match manufacturer's make and style as specified,

01 - General Requirements

submitted, and approved for all doors in project scope. Provide a hardware submittal from the aluminum entrance and storefront manufacturer for review by the University Representative.

B. Code Requirements

1. Doors from rooms that do not have panic bar shall have lever-type handles that do not require any special knowledge or effort to operate. All locks, electrified or otherwise, may not restrict egress.
2. Hardware for labeled openings, such as locks, latches, butts, door closers, coordinating and exit devices, etc. shall be to carry State Fire Marshal and Underwriters Laboratories, Inc. (UL) listed and approved for opening classification.

C. Emergency Key Cabinets

1. Provide emergency key cabinets / Knox Box(es) at the main entrance(s) for all new buildings. The University Representative shall coordinate locations as determined by the Campus Fire Marshal.

D. Locks and Keying

1. Schlage is the basis of design for lockset models. Any variation must be reviewed and approved through the University Representative.
2. All locksets shall be Schlage ND Series. Lock functions and finishes shall be furnished as indicated in the hardware schedule, or equal. The contractor shall provide the specified locksets with temporary 6-pin construction cylinder and keys. Provide temporary cylinders only in locations where it is necessary to secure the project during the construction process. In addition, provide five (5) sets construction keys to the University Representative. Upon acceptance of the building or space, UC Davis Health shall provide permanent keys and Schlage EF Keyway lock cylinders to replace the construction cylinders. The Contractor shall verify that all doors and locksets easily accept permanent cylinders with no extra effort or modification. Construction lock cylinders shall be returned to the contractor. When replacing existing locksets, the cylinders shall be tagged and returned to the University Representative (then returned to Lock Shop).
3. Install hardware after doors are finish painted.
4. Door strike lip plates shall be curved and comply with ANSI 4-7/8" for all cylindrical locks. Exterior locks, latches, and deadlocks shall have wrought boxes.

E. Fasteners and Anchors

1. Thru-bolts for door closers attached to wood doors are to be avoided. Specify doors with closer reinforcement for surface fastening. Hardware fastened to concrete, or masonry shall be installed with machine screws and "star" type double expansion shields, or for screw sizes less than ¼", fasten with wood screws and plastic anchors. Do not use lead shields or tampins.
2. Door hardware mounting heights throughout a project shall be uniform. Renovation and remodel project hardware placement shall match that of the existing doors throughout the building. This shall be field verified and approved by the University

Representative.

F. Hinges

1. Hinges types shall be selected for each door type performance, use and location. Pivot, swing- clear or standard butt hinges are to be listed in each hardware group. Butt hinges shall have five (5) knuckles typical with non-removable pins
2. Standard hinge properties include 3/16" thick, 1-1/2" widths. The hinge pin shall have a continuous machined surface and use concealed, stainless steel ball bearings. Hinge fasteners shall be either stainless steel or silicone bronze. Hinge pins may be in contact with swaging of the door leaf.
3. Hinge spacing and quantity is based upon door leaf size. 36" wide doors require three (3) hinges. Any doors wider than 36" require a minimum of four (4) hinges.
4. Hinges on aluminum and glass type storefront doors, fiberglass reinforced polyester (FRP), and heavy lead shielded doors shall be geared continuous hinges.

G. Closers

1. LCN 4040XP with RW-PA Arm is the basis of design for door closers. Door closer cylinder construction to provide low wear operating capabilities of internal parts throughout the life of installation. All door closers shall be tested to American National Standards Institute (ANSI)/ Builders Hardware Manufacturers Association (BHMA) A156.4 test requirements by BHMA certified testing laboratory. All closers shall be fully hydraulic and have a full rack and pinion action. Universal type closer are preferred. Handed closers shall be avoided. All closers shall be non- sized to provide a full range of closing power for all sizes of door. For barrier-free applications, closer spring power shall be adjustable to provide less than 5 lbs. opening force for doors 36" to 48" wide. Fire rated doors shall be adjustable to 15 lbs. maximum force. All closers shall utilize temperature stable fluid that is capable of withstanding temperature ranges from 120°F to -30°F without requiring seasonal adjustment of closer speed to properly close the door.

H. Power-assisted Operators

1. Single, double, or dual egress doors that serve areas of high cart or patient bed/gurney traffic shall have power-assisted operators installed to mitigate door damage and injury to staff.

I. Automatic Door Operators

1. The door shall have the ability to function as an automatic door or, in an emergency, via manually operated break-out swing panels.
2. Door operators shall be surface-mounted and enclosed in an extruded aluminum case extending the full width of door frame. Access to the operator shall be obtained by removing the casing. All wiring for the automatic entrance components shall be concealed. Exposed conduit, wire-mold or electrical pathways are not permitted.
3. A keyed shut off switch keyed to the UC Davis Health master key system shall be provided to shunt power to auto door openers after normal hours of operation. Access to the building after normal hours of

operation shall be provided by either a handheld radio frequency remote control or card access system. A locked door motor protection circuit shall be supplied that will shut off current to the motor when the door is locked or otherwise prevented from opening.

4. Coordinate door operation with security devices, such as card key entry systems. Locate sensors at correct distance from the door for safe clearances and proper travel time. If the door

encounters an obstruction, the master control unit shall provide immediate reversal of door motion without undue strain on the drive train by providing stepped voltage to the motor. The opening and closing speed shall be between four (4) and six (6) seconds. The master controller unit shall allow fine tune adjustments in close times, delays and expiration of signal to doors. The opening force shall be able to be adjusted without affecting the opening speed. The opening and closing force, measured 1" out from the lock stile of the door and shall not exceed 15lbs force in either direction.

J. Manufacturers

1. The manufacturer shall have a minimum of five (5) years successful experience in the fabrication of automatic operators of the type required for the project.

K. Door Operators: Refer to Design Guideline Automatic Entrances 08 42 29 above for specific functional requirements.

L. Exit Devices

1. Panic Rim: Von Duprin Series 98, or equal is the standard of quality. All devices shall be ANSIA 156.3, 2001, Grade 1 certified and have a 3-year manufacturer's warranty.
2. Panic w/ vertical rods: Von Duprin Series 98, or equal is the standard of quality. Surface external rods are preferred, and internal concealed rods are to be avoided. Provide only top vertical rods and bottom fire bolts.
3. All moving parts shall be easily removable for repair and maintenance; moving parts that are riveted or swaged in place are not acceptable.
4. All wide stile devices shall have dead latching latch bolts to ensure safe and secure opening.
5. All devices shall use durable compression spring design. Devices, latches, trim or controls, incorporating tension springs are not acceptable.
6. Incorporate a dampener type mechanism to decelerate the push bar on its return stroke eliminating noise associated with the device's operation.
7. Devices shall be ANSIA 156.3, 2001, Grade 1 certified and have a three-year manufacturer's warranty. Surface external rods or internal concealed rods are to be evaluated per project.
8. Brass or moving parts made of die-cast "pot" or "white" metals are not permitted.

M. Push and Pull Plates

1. Plates to be stainless steel.
 2. Pull plates shall be without screw holes and when used with pulls. Pulls shall be bolted through the door under the push plate at the grip only.
- N. Surface and Flush Bolts
1. Flush bolts shall have a lever arm that is not friction-operated, connected to the bolt mechanism and mechanically fastened, not press fitted. Face plates shall be shaped to match the door edge. The operating mechanism for the bottom flush bolt shall not be more than 12" from the floor; the top flush bolt shall not be more than 72" from the floor. All surface or flush bolts shall have dustproof strikes where engaging the floor, threshold or curb.
 2. Flush bolts that require the top and bottom corners of wood doors to be mortised out are not acceptable.
- O. Stops and Holders
1. Provide door stops for each door leaf. If stops are wall mounted, provide backing in the wall for proper mounting installation.
 2. Floor Stops are preferred. Wall stops are acceptable when floor stop is not appropriate. Overhead stops may be used in limited instances when floor or wall stops are inadvisable. If an overhead stop is used, pair it with heavy duty hinges, or continuous hinges. Do not provide hold open stops when using overhead style.
 3. Ives, Glynn Johnson, or equal are the standard of quality for stops.
- P. Silencers
1. Provide silencers for all interior doors, except on weather stripped or smoke sealed doors.
 2. Single doors shall have three (3) silencers each, located on stop and at strike side of the frame. Double doors shall have one (1) silencer per door leaf at frame head, plus three (3) each on astragal.
- Q. Smoke and Weather Door Seals
1. Where required, provide adhesive jamb weather-strip. Pemko S88, S44W, or equal are the standard of quality.
- R. Finishes
1. All hardware finishes shall conform to BHMA product standards, materials, and finishes. UC Davis Health's standard is 626 Satin Chrome. Finishes for hardware in existing facilities shall be as listed above or to match existing.
- S. Hardware Installation
1. Center lever hardware is at 38" above finished floor. Locate top hinge 5" below the head of the frame, and the bottom hinge at 11" above the finished floor. Place intermediate hinges equally between top and bottom hinge.

GLAZING

08 80 00

- A. The basis of design for fire rated glazing is TGP or equal.

- B. Exterior Glass
 - 1. Determination of light transmittance, visibility, color and performance requirements is unique to each project, and the specific functional requirements. The general guideline is to provide the best thermal performance, while at the same time offering the best visibility and transparency into the building.
 - 2. Performance requirements must meet Title-24 requirements.
 - 3. Exterior glazing shall be 1" insulated units with a low-e coating.
- C. Interior Glass
 - 1. Safety Glass: Provide where required by codes.
 - 2. Door Glazing: Refer to Design Guidelines Section 08 11 00 for vision lights.
- D. Mirrors
 - 1. Minimum ¼" thick. Provide smooth round safety edge.
 - 2. ASTM C-1503-01 for silvered flat glass mirror
 - 3. Attach to walls with mechanical cleat-type anchors to metal studs or solid backing and apply mirror adhesive.
- E. Glazing Accessories
 - 1. Provide reglets, spacers, gaskets, trim, and applied stops with caulking to secure glazing in place.

GENERAL DESIGN CRITERIA 09 00 00

- A. General Design Requirements
 - 1. Provide low-maintenance finishes and design low-maintenance details. Finishes must stand up to the rigorous abuse of classrooms, offices, laboratories, outpatient and inpatient facilities over the life of a building. With long building life cycles and infrequent facility refreshes, specify only the most durable materials and products.
 - 2. Exterior finishes shall be durable and designed to a 70-year standard without extensive maintenance, and with no deferred or anticipated maintenance for the first 20 years. Painting of exterior surfaces shall be kept to a minimum, and if provided, must be a high-performance system.
 - 3. Provide surface reflectance values of 85% for ceilings, 60% for walls, and 20% for floors in clinical areas, to improve task and overall illumination. Use white or light color finishes for ceilings, walls, countertops (white, off-white, putty or light grey), and floors. Minimize surface gloss of ceilings, painted walls, work surfaces and floors.
 - 4. Submit EPDs and HPDs for all finish materials.

CEMENT PLASTERING 09 24 00

- A. Avoid lath and plaster systems as a primary exterior cladding material for new projects.

The system's lack of longevity is a key reason to opt towards more durable finishes.

- B. Cement plaster shall be a traditional 7/8" three-coat system consisting of a Portland cement scratch coat, Portland cement brown coat and acrylic modified sand finish coat. Scratch coat shall contain "fiber mesh" type glass fiber reinforcing to control cracking. Finish coat shall be integrally colored, and colorant shall not be waived in lieu of surface painting. Surface painting is required over finish coat. Integral plaster color shall best match surface paint color. Well-designed control joints of areas not to exceed 100 square feet shall be clearly documented to limit cracking and repair maintenance work.

GYPSUM BOARD

09 29 00

- A. Gypsum Board Finish Levels
 1. Level 1: Not used
 2. Level 2: Concealed spaces, such as shafts and above-ceiling areas, and areas where Gypsumboard is used as a substrate for tile.
 3. Level 3: Medium Texture: Unoccupied areas, such as storage and mechanical rooms
 4. Level 4: Light Texture: Occupied spaces and surfaces exposed to public view.
 5. Level 5: Smooth finish for areas receiving markerboard wallcovering or as approved by the University Representative.

TILING

09 30 00

- A. General
 1. Both mortar-set and thin-set tile systems may be used where appropriate. System selection shall be based both on the suitability of the material and the project requirements and approved by the University Representative. When using mortar-set systems, recess floor slabs to maintain level and accessible surfaces between rooms. Porous materials may not be used.
 2. Use of ceramic (porcelain) tile is acceptable in areas with excessive water and/or cleaning, such as restroom floors and walls. The grout used for ceramic floor tiles shall be sealed with a VOC compliant sealer. Provide epoxy and/or epoxy hybrid grout at tile in wet areas.
 3. Provide marble or solid surface thresholds at entrances to rooms with ceramic tile floors.
 4. Ceramic tile may not be used in shower floors because the grout breaks down creating an infection control problem.
 5. Floor tile, tested, both wet and dry, shall have a minimum static coefficient of friction of 0.60 for level surfaces, and 0.80 for ramps, in accordance with ASTM C1028.

ACOUSTICAL CEILINGS

09 51 00

- A. General Requirements
 - 1. Suspended acoustical ceilings shall be installed in accordance with the provisions of ASTM C635 (materials) and ASTM C 636 (installation). Provide heavy-duty exposed tee suspension system.
 - 2. Tegular and square lay-in edge profiles for ceiling tiles are acceptable. Concealed spline systems are not acceptable. Clean rooms and other infectious controlled environments require a mylar coated ceiling tile, or similar. Children's areas can have tiles with decorative embossed themes. Provide white tiles and suspension grids unless approved otherwise by the University Representative.
- B. Codes and Standards
 - 1. Ceiling design shall comply with CBC Section 1613.1 Earthquake Loads. Every structure and portion thereof, including non-structural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with ASCE 7, excluding Chapter 14 and Appendix 11A. Determine the seismic design category for the structure in accordance with Section 1613 or ASCE 7.
 - 2. In accordance with ASCE 7-10 Chapter 13, acoustical tile or lay-in panel ceilings in Seismic Design Categories D, E and F shall be designed and installed in accordance with ASTM C 635, ASTM C 636 and ASTM E580, Section 5-Seismic Design Categories D, E and F as modified by this section.

RESILIENT FLOORING

09 65 00

- A. General
 - 1. Areas where liquids are used, stored, or have chance of spillage shall have watertight flooring system with heat or chemical welded seams with at least a 4-inch continuous coved base. Weld method to be approved by the University Representative. Provide a cant strip for support under the coved base with metal trim at the top. Use a commercial grade sheet vinyl or rubber floor

with a welded coved base. VOC compliant poured flooring systems will be considered, especially in food preparation areas or shower rooms.
 - 2. Areas void of liquid spills can use sheet vinyl flooring with a topset rubber base and a variety of materials and manufactures are acceptable.
 - 3. Sheet vinyl products are to be unbacked, nonlayered, polyurethane-coated, homogeneous vinyl with a wear layer. Color and pattern detail shall be dispersed uniformly throughout the product.
 - 4. Patient areas – shall have flooring products with good sound absorption, easy maintenance, and appropriate slip/fall coefficient. Rubber flooring is preferred and will maintain well if the finish process described by the manufacturer is followed carefully after the product is installed and prior to occupancy.

5. Projects with fresh concrete subfloors intended to receive resilient flooring products shall be tested for moisture and PH with the current standard test method. Provide test results to the University Representative for review and approval prior to any flooring material being installed. Consult with flooring manufacturer for appropriate adhesive for moisture and PH levels of concrete.
6. In projects with tight schedules, use a quick set or peel and stick adhesive that meets current VOC requirements.
7. Aerosol adhesives shall not exceed the VOC limits specified in the Green Seal Standard GS-36
- Current Version.
8. Non-aerosol adhesives and primers shall not exceed the VOC limits specified in the South Coast Air Quality District Rule 1168, current version.
9. Flooring at Permanent Cabinets: Resilient flooring is required under fixed floor cases and cabinets.

RESILIENT FLOORING ACCESSORIES

09 65 13

- A. Wall Base: Rubber base preferred for durability and sustainability. Thermoplastic rubber (TR) or thermoset vulcanized rubber (TS) shall be used as standard. Thermoplastic vinyl (TV) base only to be used with the University Representative's approval.
 1. Use 6" base in patient areas and 4" in administrative areas. Use only topset base, straight base may not be used.
 2. In areas requiring sheet vinyl with a coved base, provide a concealed cant strip for support and metal trim at the top.
 3. Adhesives
 - a. Aerosol adhesives shall not exceed the VOC limits specified in the Green Seal Standard GS-36, current version.
 - b. Non-aerosol adhesives and primers shall not exceed the VOC limits specified in the South Coast Air Quality District Rule 1168, current version.

RESILIENT TILE FLOORING

09 65 19

- A. General
 1. VCT tiles with topset base may be used in areas void of liquids such as public areas, clinics and patient settings, including patient rooms, with the University Representative's approval if other flooring types are cost prohibitive.
 2. Luxury Vinyl Tiles and plank tile systems (LVT) may be used in areas void of liquids in lieu of VCT tiles for an upgraded appearance in public, administrative office settings and patient areas for more design-oriented projects with moderate budgets.
 3. LVT shall have a coefficient of friction of 0.7 or greater.

4. PVC-free products align with UC Davis Health's sustainability principles and are encouraged.
5. Rubber floor tiles can be used over existing VCT floors in patient areas, including patient rooms, that cannot be closed during construction, or if there is asbestos in the existing mastic. Also, rubber floor tiles are installed with a double stick tape for ease of phasing in occupied spaces. They can also be used where heavy equipment is used such as loading docks.
6. Aerosol adhesives shall not exceed the VOC limits specified in the Green Seal Standard GS-36, current version.

FLUID-APPLIED FLOORING

09 67 00

A. General

1. Resinous flooring material may be used in high-traffic areas with or are subject to extreme water usage, such as operating rooms, tub rooms, food preparation areas, waste collection sites, staff showers and decontamination/disinfection areas.
2. Fluid applied (epoxy) floors shall be non-slip and meet any additional requirements of the facility, such as conductivity.
3. Resinous flooring system to be comprised of: Bisphenol-A Epichlorohydrin condensate type resin formulation consisting of bond coat, base coat, texture coat, and finish coat, 1/4" total thickness; flexibilized with a reactive diluent; other additives consisting of an inert color pigment, curing agent, and high SiO₂ filler.

B. Installation Accessories

1. Divider Strips shall be: 1/4" wide heavy top strip and made of zinc.
2. Antimicrobial chemical additive shall be used to prevent growth of most bacteria, fungi, algae, and actinomycetes and applied as recommended or approved by flooring manufacturer.

- C. Finish Surface shall be: Semi-gloss, dense, nonporous, smooth texture, unless specified otherwise and approved by the University Representative.

CARPETING

09 68 00

A. General Use Carpet (Carpet Tiles)

1. Carpet tiles shall be used to the greatest extent possible. Sheet carpet shall be used only upon approval by Facilities Services.
2. Carpet tiles shall be a commercial grade multi-colored, non-directional patterned loop or tip-shear to hide soil. Cut pile carpets may be used in high-end administrative areas if desired. Carpets with subtle multi-colored directional patterns will be considered for some projects but must be reviewed by the design team prior. Colors and shades selected shall be of medium intensity (not so light as to easily show

- soiling or so dark as to show dust and lint). Solid color carpet shall not be used.
3. Wear Rating: Heavy or Extra Heavy Commercial: Vetterman Drum wear test- Rating of 3 or better DIN 54323- ISO-TR 10361
 4. Face Weight
 - a. 20 oz. minimum.
 5. Face Yarn
 - a. 100% first quality bulk continuous filament (BCF). Acceptable specifications include type 6,6 nylon, type 6,6 Antron nylon combined with polymer made from renewable resource or type 6 with inherent stain resistance by means of cationic dye process.
 6. Acceptable Commercial Fiber Shapes for optimum soil-hiding capability
 - a. Fiber identification at AATCC 20 test method
 - b. Modification ration of 1.7 or less
 - c. Dye Method: 100% Solution Dyed
 - d. Gauge: 1/8" min
 - e. Construction: Tufted
 - f. Surface/Style: Level Loop or Multi Level Loop
 - g. Color: To be approved by the University Representative
 - h. Density Factor: 5,000 min.
 7. Stain Resistance: Stain resistance properties MUST be inherent. Topical Stain resistance treatment will not be acceptable. Stain Resistance properties must be permanent and cannot be removed by commercial cleaning or abrasive wear. Must pass the AATCC 175 red dye 40 tests. Carpet is required to retain permanent stain protection against acid type spills for the life of the carpet as measured by General Services Administration (GSA) test for permanence SIN 31-8.
 8. Edge Ravel: Limited lifetime Warranty against Edge Ravel. Preference will be given to carpet manufacturers that do NOT require the edges of the carpet to be seam sealed to guarantee 20 years of edge unraveling.
 9. Tuft Bind: Wet: Limited Lifetime Warranty against zippering
 10. Color fastness-light/color: Carpet is required to resist color loss from light exposure for 10 years. Manufacturer is required to provide a 10-year warranty for colorfastness after exposure to light as measured by AATCC Test Method 16E- International Gray scale rating after 160 AFU's should be 4 or better.
 11. Colorfastness-ozone: Carpet will resist color loss from Atmospheric Contamination for 10 years. Carpet manufacturer is required to provide a 10-year warranty for colorfastness after exposure to atmospheric contaminants as measured by AATCC Test Method 129- Ozone minimum shade change rating after five cycles shall be no less than International Gray scale rating of 4 or better.
 12. Colorfastness-crocking: Rating shall be 4 or better (wet and dry) AATCC transference scale AATCC 165.
 - a. Carpet is required to resist color transfer from wear for the life of

the carpet. Carpet shall exhibit permanent colorfastness (wet or dry) for the lifetime of the installation as measured by AATCC Test method 8, minimum stain rating of 4 or better compared to AATCC color

transference scale.

- b. The carpet shall also exhibit permanent wet fastness for the lifetime of the installation as measured by AATCC Test Method 107, minimum shade change should be no less than International Gray Scale rating of 4 or better. water: 4 or better AATCC transference scale AATCC 107

13. Flammability NBS smoke: <450 flaming mode NFPA 258

14. Flammability Radiant Panel: Class 1

fire rated ASTM E-648 15. Class A fire

rated per ASTM E-84

16. Carpet shall be certified by the California Gold Sustainable Carpet Standard at the Gold or Platinum level. Carpet tile systems shall not exceed the target emissions factors of the Carpet and Rug Institute's following programs:

- a. Carpet: Green Label Plus Program and Testing Procedures.
- b. Carpet Cushion: Green Label Program and Testing Procedure
- c. Carpet Adhesive: Green Label Program and Testing Procedure.

B. Walk-Off Carpet Tiles: Provide walk-off carpet tiles at main building entrances where the primary finish is carpet.

PAINTING AND COATING

09 90 00

A. General

1. Materials shall be "best" commercial quality products by firms with over 5 years manufacturing experience with a full product line. Prime coats and finish coats for any 1-paint system shall be the products of the same manufacturer. Dunn Edwards Paint shall not be used due to proprietary color system and color match difficulties.
2. Architectural coatings shall comply with the Green Seal Standards GS-11 and the most current LEED Requirements, whichever is more stringent.
3. Visible surfaces behind vents, grilles, etc., shall be painted flat black.
4. Inside wood surfaces of all drawers, shelves inside cabinets, and other wood surfaces where scheduled or noted, shall be given one coat of clear gloss lacquer, or clear polyurethane-base varnish.

VISUAL DISPLAY UNITS

10 11 00

Provide support backing in the wall for both furnished and future visual display boards.

SIGNAGE

10 14 00

- A. Signage Consultant will be retained either by UC Davis Health or the Architect of Record to develop signage documents and schedules based on the UC Davis Health's signage standards. These documents might be incorporated into the bid documents or bid separately. The University Representative shall determine how the signage consultant will be retained for the project and how the signs will be bid.
- B. Exterior Signage
 - 1. Regulatory signs required for projects shall adhere to the current California Uniform Traffic Control Devices or (MUTCD) standards. Regulatory signs include "Stop" signs, and street directional signs such as "No Right Turn" etc. Regulatory signs shall have a high intensity prismatic sheeting (HIP) applied.
 - 2. Regulatory Signposts: 2" OD round extruded aluminum with 1/8" thick wall thickness, alloy 6063 with cap at the top. Poles will be either anodized aluminum or painted silver with a DTM paint. Posts shall be set in concrete footings a minimum of 12 wide x 18" deep with a through bolt through the post to prevent the sign from turning. The top of the sign, when installed on the post, shall be 75" above the footing.

TOILET COMPARTMENTS

10 21 13

- A. Type: Floor-mounted, overhead braced, with through-color, polymer plastic, privacy (zero gap) partitions.
- B. Construction: Interlocking doors and stiles, maximum height doors (72") and panels, floor clearance between 1" - 4"
- C. ADA accessible toilet compartments must be made wide enough to accommodate the UC Davis Health's choice of tissue dispensers and surface mounted sanitary napkin disposals where required.
- D. If the Project Program indicates a need for high-abuse-resistant design, provide institutional hardware for partitions, including extra-heavy-duty hardware, concealed attachments, and concealed screws on doors.

CUBICLE CURTAINS AND TRACK

10 21 23

In hospital settings, cubicle curtains shall be required around every patient bed and shall be approved by the University Representative. Disposable Privacy Curtains are the UC Davis Health's standard, unless otherwise approved by the University Representative.

PATIENT BED SERVICE WALLS

10 25 13

Patient bed service walls shall be modular systems, with field customization options. Finishes and surfaces shall be bleachable and high impact.

WALL AND DOOR PROTECTION

10 26 00

- A. Hospital corridors shall have wall protection as a typical; including crash rails, handrails or a combination of both with the crash rail located just above the wall base.
 - 1. In high-abuse patient areas, provide sheet wall protection between the handrail and crash rail.
 - 2. In hospital corridors the hand and crash rails often match the base color and patient room doorframe color to create a continuous line down a corridor.
 - 3. Provide corner guards on hospital corridors and any area subject to high abuse, especially from carts and gurneys. Corner guards shall match the wall color. Corner guards shall be full height starting from top of wall base.
- B. In other building types, provide corner guards at outside corners of all high-traffic circulation typical.

TOILET ACCESSORIES

10 28 13

- A. The following categories of restroom accessories are those for which UC Davis Health requires standardization from project to project.
 - 1. Roll Hand Towel Dispenser: Wall Mount ADA compliant with touchless feature
 - 2. Hand Soap Dispenser: Surface mount or counter mount, touchless design
 - 3. Toilet Tissue Dispenser: Dimensions must be a four-roll vertical coreless bathroom tissue dispensing system. Dispenser must hold up to 6,000 2-ply or 12,000 1-ply sheets. Dispenser must have a dependable roll advancing system; dispenser must facilitate full roll usage.
 - 4. Sanitary Napkin Dispenser: Surface mounted feminine napkin/tampon vendor; stainless steel; \$0.50 coin mechanism.
 - 5. Mirrors: Mirrors shall be 1/4" thickness with solid backing. Frames shall be 1/2 inch by 1/2 inch by 1/2-inch heavy-duty stainless-steel angle, with all corners mitered and welded. Tilt mirrors shall be stainless steel with tilt built into frame.
- B. Towel disposal units are not required in any new or remodel work. These units will be freestanding, provided by UC Davis Health.

FIRE EXTINGUISHERS

10 44 16

Fire extinguishers shall be provided at locations as required by current edition of California Building Code and as approved by the University Representative.

Recessed, lockable stainless-steel cabinets shall be provided for fire extinguishers in corridors and other public places. Extinguisher shall be refillable.

LOCKERS 10 51 00

Lockers shall be industrial-grade plastic laminate with heavy-duty hinges. Lockers shall be securely attached to backing plates in the walls.

WINDOW WASHING EQUIPMENT 11 24 23

A. General

1. Tie-off anchors shall be designed and installed on all new roofs per ANSI/IWCA I-14.1.
2. A minimum of 10% of the tie-off anchors shall tested on site using load cell apparatus in accordance with manufacturer's recommendations. Tests shall be conducted by an independent agency, and test reports shall be sent to the University Representative.
3. All anchors relying upon chemical adhesive fasteners shall be 100% tested on site at the testload as recommended by the SEOR, using load cell apparatus in accordance with manufacturer's recommendations. Tests shall be conducted by an independent agency in the presence of the UC Davis Health's assigned special inspector, and test reports shall be sent to the University Representative.

LABORATORY FUME HOODS 11 53 13

A. General Fume Hood Requirements

1. Published specifications, standards, tests or recommended methods of trade, industry or governmental organizations shall apply to all work in this section.
 - a. NFPA 45 - Standard on fire protection for laboratories using chemicals. Chapter 6: Ventilating System, Chapter 9-2.8: Laboratory Hoods.
 - b. NFPA 56C - Safety standard for laboratories in health-related institutions, chapter 3-3.5: Fume hoods.
 - c. ASHRAE 110, Method for Testing Performance of Laboratory Fume Hoods.
2. Requirements of Regulatory Agencies
 - a. Flammable liquid storage cabinets shall conform to all certification requirements as specified by the Campus Fire Marshall and NFPA 30.
3. Fume Hood Design shall comply with the following Standards
 - a. Scientific Equipment and Furniture Association (SEFA), latest edition.
 - b. ASHRAE Handbook - HVAC Applications: Chapter 16 -

Laboratories: Part 16.3: FumeHoods

- c. ANSI Z 9.5 Laboratory Ventilation Standard
- d. National Sanitation Foundation (NSF) Standard 49
- e. Guidelines for Design and Construction of Health Care Facilities - Facility Guidelines Institute; Part 6 Ventilation of Health Care Facilities - Sections 410: Laboratory Ventilating Systems and Hoods.
- f. Balance, test, and certify each fume hood in accordance with the latest edition of ASHRAE 110 Testing Requirements. Fume hood field tests shall be performed by a qualified independent testing company on each hood to determine face velocity, containment, response time (for hoods installed on a VAV lab airflow control system), cross drafts, and air flow patterns. Test results shall be submitted to the University Representative.

4. General Design Issues

- a. Fume hoods shall be operated 24 hours a day. No user-controlled shut-off switch is allowed.
- b. Fume hood ducts may be ganged onto exhaust plenum w/ multiple fans, with the exception of hot-acid, radioactive, or other special use hood.
- c. Full by-pass fume hoods shall be used for constant volume applications. Variable air volume (VAV) hoods (partial by-pass) shall be used in conjunction with a VAV general ventilation system (e.g., Phoenix Controls, or equal).
- d. Ductless or auxiliary air hoods are not acceptable.
- e. Only removable baffles with three fixed horizontal slots or perforated baffles shall be provided. If slots are to be provided, they shall be continuous across the back of the fume hood. Engineered perforations are acceptable. Operator adjustable baffles and monolithic rear panels are not acceptable.
- f. The manufacturer's standard tissue screens shall be provided to prevent tissues from entering mechanical systems.

B. Chemical Fume Hoods

1. General Product Requirements

- a. All chemical fume hoods shall be reviewed and approved by the University Representative.
- b. Shall have been in commercial production and usage for a minimum of 5 years.
- c. Shall be tested using most current American National Standards Institute (ANSI)/ASHRAE 110 method.
- d. Noise generated by the functioning hood within 6 inches of the plane of the sash and by-pass opening in any position shall not exceed 60 dBA.
- e. Unused holes (interior and exterior) shall be plugged or blanked.

2. Sash
 - a. Sashes shall be vertical-type or frameless. Vertical-type: ¼-inch thick laminated safety glass, complete with ¼-inch deep stainless steel metal channels on sides, top and bottom.
 - b. Combination sashes shall be approved by the University Representative.
 - c. Mechanical stops (not friction) shall be provided to ensure that sash work opening is 18 inches, as measured from the top of the fume hood work surface to the bottom of the sash.
 - d. A manual override shall be required to allow the vertical sash to be raised above the maximum opening to allow lab apparatus to be installed or removed.
 - e. Operating face velocity at 18 inches shall be set between 100-120 fpm.
3. Provide a fume hood air flow indicator/alarm. The hood shall be prepared at the factory to receive the specified alarm/monitor. As a minimum, the alarm shall accommodate the following:
 - a. The Safety Monitor/Alarm System shall monitor face velocity and provide audible and visual alarm if face velocity drops below 90 fpm or rises above 125 fpm. Audible alarm shall pulse at 80 dBA.
 - b. The monitor shall be UL listed, with all alarm circuit electric components, external tubing, restrictors and manifolds furnished complete. Monitor shall have light emitting diode display, which provides clear indication of airflow conditions. Safety monitor shall be tamperproof.
 - c. Alarm signal(s) shall have an audible pulsating signal and a visual, large flashing red light emitting diode.
 - 1). The alarm system shall provide a silence push button, which temporarily overrides the audible alarm for a period no longer than 5 minutes and shall be accessible on the front of the Safety Monitor. Note: Teaching laboratory hood alarm override shall not exceed a one-minute period. Once the "unsafe" operating condition has been corrected, the audio alarm shall automatically reset.
 - 2). During a temporary silence of audible alarm, the visual alarm shall remain activated until the alarm condition is corrected.
 - 3). When the alarm condition is corrected and face velocity and volume is return to specified levels, the safety monitor shall automatically reset and begin routine monitoring.
 - d. Test circuit shall be provided to verify proper safety monitor operation.
 - e. Electrical Rating: Maximum 15 VDC and maximum current rating of 200 MA.
 - f. Connect between fume hood and the filter or damper.
 - g. Flow tube device (floating indicators), magnehelic, or ribbons hanging in the air stream are not acceptable airflow indicators.
4. Electrical Items
 - a. All electrical items shall be pre-wired, and accessible for service from outside the hood. No fan switches shall be located at the fume

- hood.
- b. Run internal electric wiring in conduit. Do not run conduit through hood interior or across hood front.
- 5. Utilities (gas, air, water, steam, and vacuum)
 - a. Utilities controls shall be located outside of hood interior for convenient access and use. No plumbing utilities may run through the hood interior or across the front of hood.
 - b. When cold water is required, provide vacuum breaker.
 - c. Access panel to service utilities shall be gasketed with gasket material specific to use.
 - d. Pre-plumb all utilities.
- 6. Duct Work
 - a. Materials shall be non-reactive, acid resistant and compatible with intended usage.
 - b. Include trim damper in duct above fume hood.
 - c. Duct outlet shall be round. Provide a square-to-round transition when equipment manufacturer system uses square profile.
- 7. Fan: Use only acid-resistant metallic fan protected by an inorganic coating.
- 8. Flammable storage cabinets shall be UL listed and/or NFPA approved.
 - a. Flammable liquid storage cabinets do not require venting. If flammable liquid storage cabinets are vented, they shall be vented separately from the fume hood exhaust. The vent may be connected at the point where the fume hood exhaust duct enters the general fume hood exhaust manifold. Cabinets shall not be vented directly into the fume hood or through the fume hood work surface. Vents shall be stainless steel. All equipment subject to review and approval from Campus Fire Marshall.
 - b. Acid storage cabinets are approved for under-fume hood storage. Acid/corrosive storage cabinets do not require venting. If acid/corrosive storage cabinets are vented, they shall be separate from the fume hood exhaust. The vent may be connected at the point where the fume hood exhaust duct enters the general fume hood exhaust manifold. Cabinets shall not be vented directly into the fume hood, through the fume hood work surface. Vents shall be PVC, polypropylene, or other appropriate material.
- C. Acid Fume Hoods
 - 1. Additional Product Requirements for Acid Fume hoods (Perchloric, other hot inorganic acid digestions, etc.)
 - a. Constant volume hood with by-pass feature.
 - b. Perchloric acid and other hot acid digestion hoods shall be on a dedicated system and have an automatic wash down system. High use solvent extraction and solvent use hoods (ether, other flammable solvents, etc.) shall be on a dedicated system designed for their intended purpose.

- c. Under fume hood storage cabinets: Flammable liquid storage cabinets are not approved for installation under acid fume hoods.
- D. Hydrofluoric (HF) Acid Fume Hood
 - 1. HF acid fume hoods shall be a constant volume hood with bi-pass feature and shall be on a dedicated system.
 - a. Flammable liquid storage cabinets are not approved for installation under HF acid fume hoods.
 - 2. Sash
 - a. Sashes shall be a polycarbonate resin (Lexan) or similar. Glass is not acceptable. Contact the University Representative for project specific information.
 - b. No combination sashes shall be allowed.
 - 3. The lens on light fixture(s) shall be polycarbonate resin (Lexan).
- E. Other Specialty Hoods and Local Exhaust
 - 1. Histology hoods, specimen hoods, and other local exhaust specialty hoods shall have a minimum operating face velocity of 100 fpm with a range of 100-120 fpm. An audible/visual flow alarm may be required depending on use.
 - 2. Glove Hoods (Glove Boxes)
 - a. Glove hood (box) may be required for special applications using highly toxic, extremely reactive or California Occupational Safety and Health Act (Cal OSHA) regulated chemical carcinogens.
 - b. Glove hoods shall be a totally enclosed, ventilated cabinet of leak-tight construction with operations in the cabinet conducted through attached rubber gloves. The cabinet shall be maintained under negative air pressure of at least 0.50 in. w.g. (120 Pa).
 - c. Glove hoods shall meet ANSI standard Z9.5, "Standard on Lab Ventilation" and the American Glove Box Society Standard, "Guidelines for Glove Boxes."

BIOLOGICAL SAFETY CABINETS

11 53 53

- A. General
 - 1. All Biological Safety Cabinets (BCS) shall meet the specifications within the most recent edition of the National Sanitation Standard 49 - Class II (Laminar Flow) Biosafety Cabinetry.
 - 2. The BSC make and model must be on the National Sanitation Foundation (NSF) website of certified BSCs.
 - 3. Do not provide any class/type of biosafety cabinet other than Class II Type A2 without prior authorization from the University Representative.
 - 4. Biosafety cabinets shall not be connected to laboratory gas lines.

HEALTHCARE EQUIPMENT

11 70 00

An equipment list showing all items of equipment necessary to operate the facility shall be included in the contract documents. This list will assist in the overall coordination of the acquisition, installation, and relocation of equipment. The equipment list should include the classifications OFOI, OFCI, etc. and whether the items are new, existing to be relocated, owner provided, or not-in-contract.

WINDOW TREATMENTS 12 20 00

- A. Solar roller shades are preferred for light filtering and reducing glare.
- B. Motorization used in new construction for patient rooms, which eliminates ligature risk.
- C. Motorized shades at conference rooms - dual shades with blackout and light filtering combination.

LABORATORY CASEWORK 12 35 53

- A. Casework shall be provided as detailed in the Project Program. Construction of laboratory tops, stainless steel fabrications, laboratory wood casework, laboratory metal casework, special purpose cabinets, and miscellaneous laboratory furnishings shall be in accordance with the Project Program Requirements.
- B. Materials used for the construction of laboratory casework shall be the best of their respective kinds for the purpose intended including specialized materials, finishes and special forms conforming to product characteristics identified in the Project Program requirements.
- C. Seismic rods shall be provided for all open shelving.

COUNTERTOPS 12 36 00

Provide solid surface countertops at high use areas for durability and infection control.

ENTRANCE FLOOR MATS AND FRAMES 12 48 13

Follow Cal Green standards for entrance floor mats - install permanent entryway systems measuring at least six feet in the primary direction of travel to capture dirt and particulates at entryways directly connected to the outdoors.

FURNITURE 12 50 00

- A. All interior furnishings listed below shall be "Owner Furnished/Owner Installed" (OFOI), including but not limited to:
 - 1. Steelcase systems workstations

2. Visual display units
 3. Steelcase metal file cabinets, bookcases, and storage cabinets
 4. Steelcase task seating
 5. Waiting area seating
- B. UC Davis Health has entered into a system wide purchasing agreement with Steelcase, Inc and their local authorized vendor/installer *One Workplace Sacramento (Formerly UCF)* to provide and install all the above listed items.
1. Steelcase systems workstations
 2. Steelcase metal file cabinets, bookcases, and storage cabinets
 3. Steelcase task seating
 4. Waiting area seating
- C. Other furniture manufacturers may be considered on a project-by-project basis.
- D. The designer shall coordinate design efforts with Steelcase/*One Workplace Sacramento*. *One Workplace Sacramento* shall provide furniture plan shop drawings to the designer in PDF and CAD formats to be incorporated into the design drawings.
- E. The designer shall be responsible to provide anchorage structural calculations and details for all furniture items needing non-structural seismic anchorage as required by building codes.
- F. Stationary workstations in the office/laboratory setting follow good ergonomic principles providing height adjustable work surfaces, openings adequate for leg and knee clearances and sufficient overhead space to allow adjustments to vertical equipment placement. The ANSI/HFES100 (current version) "Human Factors Engineering of Computer Workstations" shall be reviewed by the Design Professional.

INTERIOR PUBLIC SPACE FURNISHINGS

12 93 00

- A. Provide built-in trash receptacle at all public, staff and patient restrooms. Trash receptors at all other areas as well as recycle bins will be the responsibility of UC Davis Health. In high-traffic areas (including restrooms), UC Davis Health may add additional trash receptacles as needed. Recycle bins are multi-purpose receptacles for cardboard, mixed paper, bottles and cans, and trash. Compost collection compartments shall be required in 2022 by code.
- B. All trash receptacles and recycle bins proposed to be in any corridors shall be reviewed and approved by the Fire Marshal.
- C. Proper signage is required, ideally at eye level or on the lid or opening, to avoid contamination. Verify with the University Representative for current signage requirements.
- D. Trash receptacles shall be hospital grade.

SPECIAL CONSTRUCTION

13 00 00

Special construction covers a wide range of items from aquatics, animal handling, clean rooms, cold rooms, engineered structures, building modules and radiation Protection. Projects on the UC Davis Health campus may not always contain such specialty equipment. When special equipment is identified in the program, the Design Build partner will coordinate with the University Representative to further define specialized requirements, in consultation with FD&C and PO&M.

CONVEYING EQUIPMENT

14 00 00

- A. Elevator types may include but are not limited to pedestrian, patient, service, helistop -type elevators. Specific requirements for each elevator use such as in capacity, speed, roping platform size and inside clear size are further described in the project requirements.
- B. Provide elevators in buildings two (2) stories and greater in height. Provide elevator service to each floor including basements, mechanical rooms, and roof top mechanical penthouses.
 - 1. Where elevators extend to the roof, provide an exit path to a code-required egress stair.
- C. Passenger elevators shall be non-hydraulic, energy efficient and electric traction style unless otherwise approved.
- D. Select only non-proprietary elevator system controllers with a microprocessor, SCR-DC devices, or variable frequency AC drive. Elevator control systems may not be used if they require proprietary interfaces, diagnostic tools, devices, or test equipment to maintain or trouble shoot. Connect components directly to the control system without any unique manufacturer's protocol or "blackbox"- type equipment.
- E. System design to comply with regulatory requirements of ASME A17.1, "Safety Code for Elevators and Escalators" and current CBC code.
- F. For hydraulic elevator types, neither hydraulic pump nor motor can be submersible. Equipment arrangement will need to be confirmed at the early design stages as to provide adequate space for all supporting equipment. The elevator machine room shall be located adjacent to elevator. A hook-up phone line in machine room will be needed. Remote hydraulic stations are not permitted. If a remote station is required, obtain written approval from the University Representative. Biodegradable oil may be used, but it must be submitted for approval by the University Representative.
- G. Hoist way pits must be waterproof. Special attention to detailing of pits and below grade joints are required.
- H. Arrange machine room equipment to allow a minimum of 30" working clearance around all equipment. In the case of controllers, electrical switches etc. working clearances shall be in accordance with CEC.
- I. Provide standby power of the same voltage characteristics via normal electrical feeders to run one

(1) elevator at a time in each elevator group, and single elevator unit, at full-rated car speed. Provide standby single-phase power to group controller, and each elevator controller for lighting, exhaust blower, emergency call bell, intercom amplifier. Building announcement speakers. Firefighters Telephone Jack.

- J. Medical Emergency Services will need to have controls to call Elevator Numbers directly to any floor and allow an attendant to operate for medical emergency purposes.
- K. When appropriate to the project requirements, provide cardkey access systems to limit access to individual floors.
- L. Provide signaling equipment for each elevator or group of elevators. Signaling to consist of illuminated hall-call and car call buttons that remain lit until the call function has been fulfilled.
- M. Provide each car with code required telephone and alarm system.
- N. Provide each car with photo-eye detection devices for user safety.
- O. Car Equipment
 - 1. Car and counterweight safeties: instantaneous type for car speeds of 150 fpm or less and type B, flexible guide clap for speeds of 150 fpm or more.
 - 2. Provide work lights and GFI convenience outlets on top and bottom of the elevator car.
- P. Entrance Equipment
 - 1. Doors of passenger and service elevators are to be equipped with 1 ½ hour fire rating.
 - 2. Frames, doors, and sight guards to be stainless steel construction typical.

DUMBWAITERS

14 10 00

- A. Design of dumbwaiters will be reviewed on a case-by-case basis. The design and installation of systems are to be coordinated through the manufacturer of the system and approved by the University Representative. No proprietary equipment is permitted.
- B. Select dumbwaiter units that are self-supporting, with a structural steel hoist way framing designed for vertical-load support at the base of hoist way and lateral support at landing levels. Locate machine components inside the shaft, at the bottom of the hoist way.
- C. Provide fully automatic Control Systems for dumbwaiters with a call-and-send control system that responds to momentary push-button signals at each landing. Provide signaling equipment at each landing.
- D. Dumbwaiter finish to be Stainless Steel satin finish typical. Car construction to be formed, reinforced and sound-deadened steel sheets with welded joints or metal-clad plywood on all sides.
- E. Design Speed: 50 ft/min.

ELECTRIC TRACTION ELEVATORS

14 21 00

- A. To help minimize noise and control vibration, mechanically isolate elevator equipment (including hoist machines, deflector sheaves, power-conversion units and support equipment) from the structure, electrically isolate controllers, machine motors, and power conversion units. Noise level relating to elevator equipment and its operation should be limited to no more than 50 dBa in elevators under any condition including door operation and exhaust blower on highest speed.
- B. For geared hoist machines use worm gear motor, brake, drive sheave and deflector sheave mounted on a common structural frame. Locate in machine room.
- C. For gearless machines use direct drive type motor with integral sheave.
- D. To prevent injuries to service personnel, provide guards around hoistway cables, sheaves and/or any cable pinch points. Install lighting and convenience outlets in elevator pits and machine rooms.
- E. Mechanically and electrically isolate elevator equipment from the building structure.

HYDRAULIC ELEVATORS

14 24 00

- A. Hydraulic elevators will be considered only after thorough evaluation of all other options.
- B. Provide manufacturers standard single-acting under-car hydraulic plunger-cylinder unit for each elevator with electric pump-tank-control system equipment in machine room.

PNEUMATIC TUBE SYSTEM

14 58 00

- A. Provide a centrally located station control panel with Graphic User Interface for monitoring movement of system records and traffic flow.
- B. If an Air Power Unit (APU) system is selected provide energy conservation controls to automatically turn-off during periods of non-usage. Provide an Automatic Station Shutdown for each station on the network.
- C. When designing a pneumatic tube system, design sound attenuation control providing proper clearances from other systems including partition studs, building systems, and other devices wherever sound would be transmitted through physical contact.
- D. Provide smoke detectors for exhaust air lines at each APU to provide immediate shutdown and system alarm.

DESIGN CRITERIA

UC Davis Health campus buildings have issues with microbiologically influenced corrosion (MIC), special consideration should be taken to ensure that all air is purged from the piping system. Automatic air vents should also be provided at high points. Do not install thin-walled or schedule 10 piping.

FIRE SUPPRESSION

21 00 00

- A. Referenced Standards
 - 1. NFPA (National Fire Protection Agency) current edition, with California amendments
 - 2. California Fire Code, current edition
- B. Hydraulically Designed System
 - 1. All hydraulically designed sprinkler systems shall be provided with a minimum of a 10% safety margin on either the supply or pressure side of the design graph.
 - 2. All sprinkler systems shall be designed to provide the appropriate density based upon a hazard occupancy classification specified by NFPA 13. In those cases where NFPA 13 does not specifically identify the hazard occupancy classification, the UC Davis Health's Campus Fire Marshal's office shall determine the hazard classification.
 - 3. The water supply requirement for sprinklers only shall be calculated from the density curves in NFPA 13. System piping shall be calculated to satisfy a single point on the appropriate design curve. It is not necessary to meet all points on the selected curve.
 - 4. Submittals having inaccurate hydraulic calculations, content which is illegible, incomplete, or unclear, will be returned without review or approval.
- C. Materials
 - 1. Underground Piping
 - a. See Section 33 11 19 Fire Suppression Utility Water Distribution Piping and 33 11 00 Water Distribution, for requirements on underground piping.
 - 2. Above Ground Piping
 - a. Insulate water-filled supply piping in areas exposed to freezing, such as under eaves, coldrooms, passageways, etc. per NFPA standard.
 - b. Flanged fittings shall be used at above grade exterior locations.
 - c. Sprinkler piping shall be American Society for Testing and Materials (ASTM) schedule 30 or 40 black steel pipe or ASTM B88 type L copper tube installed in an approved manner. Thin-walled schedule 10 piping is not allowed.
 - d. Copper piping unique to MRI rooms shall be nonferrous. All joints for copper fire sprinkler piping shall be brazed to prevent corrosion caused by chemical interaction of soldering flux.
 - e. Automatic air vents shall be provided at high points in system to help eliminate air to reduce corrosion.
 - f. Provide means to flush piping per NFPA 13.
 - g. Preaction systems used for TR rooms and data centers.
 - h. All dry pipe systems shall include a Nitrogen generation system to inhibit corrosion.

3. Main Drain Termination
 - a. Comply with applicable and current NFPA codes.
4. Sprinkler Heads
 - a. Sprinkler heads shall be UL listed or FM approved. Concealed heads as a standard.
 - b. For exterior and corrosive atmospheres, provide wax-coated sprinkler heads. For sleeping rooms, install quick response standard type sprinkler heads.
 - c. Welding certifications needed
 - d. Nothing in this specification shall prevent submittal of new technology fire sprinkler applications provided these devices are UL or SFM listed and approved.
 - e. Sprinkler heads shall be concealed type.

DESIGN CRITERIA

Renovation and remodel projects shall employ strategies that use 20 percent less water in aggregate than the water use baseline calculated for the building (not including irrigation), after meeting the Energy Policy Act of 1992 fixture performance requirements.

COMMON MOTOR REQUIREMENTS FOR PLUMBING EQUIPMENT

22 05 13

- A. Products
 1. Combination magnetic starters shall have circuit breaker disconnects with trip size of breaker as required for motor size, or equal.
 2. Shaft grounding shall be provided on all variable-frequency drive (VFD) assemblies with operating motors 5 HP and above. Provide factory-installed shaft grounding devices, either by motor or equipment manufacturer. All motors driven by VFD's shall also be inverter-rated.
 3. Consult the University Representative for approval of field-installed devices, which shall be installed by a certified representative of the equipment, motor, or shaft grounding device manufacturer.
 4. Motor bearing(s) shall be guaranteed from electrical bearing fluting damage during the motor warranty period. Motor or bearing(s) shall be replaced at no additional cost to the UC Davis Health.
- B. Execution
 1. Motors and Variable Frequency Drives (VFDs) furnished under Plumbing Work shall be installed under Electrical Work. Contractor to coordinate all motor starter and VFD requirements.
 2. Follow shaft grounding device manufacturer's specific installation

literature, specifications, and recommendations.

3. Field-installed shaft grounding systems shall be tested for proper conductive path to ground and shall pass manufacturer's published test procedure. Motor shall be grounded to the common earth ground with drive.
4. All motors 1 HP and over that are used at least 1,000 hours per year shall be premium efficiency with no shaded pole motors on fractional horsepower motors 1/20 HP and larger.
 - a. Consider Electronically Communicated Motor (ECM) motor for fractional horsepower where applicable.
5. If motor is subject to contaminants, debris or moisture, special shaft ground systems and/or seals shall be required. Follow manufacturer's applicable recommendations.
6. For motors operating at 100 horsepower or more: Follow shaft ground manufacturer's recommendations. Often it is required by the manufacturer that two shaft grounding devices be installed.

METERS AND GAGES FOR PLUMBING PIPING

22 05 19

- A. All new buildings shall be provided with water meters connected to BMS.
- B. Repeater Totalizer is required only when meter cannot be easily read directly, as determined by the

University Representative.

GENERAL DUTY VALVES FOR PLUMBING PIPING

22 05 23

- A. General Requirements
 1. Provide shut off valves on branch lines serving each floor and at each branch line serving rooms with multiple plumbing fixtures.
 2. Valves shall be located in readily accessible areas.
 3. Valves that are concealed shall be accessible via clearly marked access panels when located above or behind new or existing finished surfaces. Access panels shall be a minimum of 12 inches by 12 inches, or as needed for maintenance access.
- B. General Purpose Shut-off Valves: All isolation valves less than 2" shall be IPS full port ball valves and valves 2-1/2" and above shall be butterfly valves. Valves should be two-piece bronze body. Pressure Reducing Valves shall be all brass, Teflon disc and diaphragm for hot water service.
- C. Fixture Shut-off Valves shall be all brass, quarter-turn angle stops, and threaded only.
- D. Check Valves shall be all brass swing check or 1/2 lb. spring check type, threaded or flanged connection (depending on application).
- E. Bench Valves shall be ball type with tapered sockets with ball and seat compatible with piping material.
- F. Laboratory Valves (air, gas, vacuum) shall be laboratory grade with

forged brass lever handles, rotating chrome plated brass ball and molded RFE seals and rated for use up to 75 psi.

HANGERS AND SUPPORTS FOR PLUMBING PIPING AND EQUIPMENT 22 05 29

Pipe isolators shall be provided at all hangers for non-insulated lines. Felt or rubber lined hangers shall be provided for non-insulated copper piping.

FACILITY DRAINAGE PIPING CLEANOUTS 22 05 76

- A. Make all cleanouts accessible. No cleanouts to be installed in ceiling spaces. Wall cleanouts are preferred to floor cleanouts at battery of fixtures. Use graphite on all cleanouts with all threads being thoroughly greased after acceptable pressure test. Provide end of line clean outs on upper floor branch lines. Cleanouts shall be provided at 50 ft interval in straight lines and at the base of any risers. At least one cleanout shall be provided in the upper floors for any horizontal carriers.
- B. Types
 - 1. Exposed: Cast iron plug.
 - 2. In Wall: Cast-iron body, stainless steel cover.
 - 3. In Floor or Grade: Adjustable, cast-iron body, ABS thread plug. In Floor or Grade: Adjustable, cast-iron body, brass plug and cover with gasket. Plug shall be installed within 1-inch of finished floor.

PLUMBING INSULATION 22 07 00

- A. Insulate
 - 1. Roof and overflow drain piping inside the building, as well as horizontal rainwater leader and overflow piping inside the building.
 - 2. Water piping, 4-inches and smaller, exposed to the weather, including interior spaces subject to outside temperatures.
 - 3. Domestic hot water piping
 - 4. Industrial hot water piping.
 - 5. Domestic water pipes in spaces that can experience high humidity such as central sterile or steam processing or in places where plenum temperature can drop below 60F.

COMMISSIONING OF PLUMBING 22 08 00

- A. General
- B. Disinfection of Water Systems
 - 1. All water systems shall be disinfected per code.
- C. Tests and Adjustments

1. Test only new piping. Final connection between new and existing piping shall be tested at normal system operating pressures. Make no test against a service valve or meter. Isolate all existing piping systems from new or existing equipment which may be damaged by test pressure.
2. There shall be no loss in pressure or visible leaks shall show after 2 hours at the pressures indicated in the table below.

System Tested	Test Pressure PSI	Test with Sanitary & Lab
Sanitary and Lab, Waste, Drain, Vent	10 ft. head	Water
Compressed Air	150 PSI	Air & Soap
Deionized Water	100 PSI	Deionized Water
Industrial and Domestic Hot & Cold Water	150 PSI*	Water
Gas	100 PSI	Air & Soap
Vacuum	27-inch vac	Air & Soap

*or 1.5 times the operational pressure, whichever is higher. Steam pipe test pressure: 50% more than operational pressure

FACILITY WATER DISTRIBUTION

22 11 00

A. Systems Definition

1. The potable water system is identified as the Domestic Water Distribution System. This system serves the building domestic water, building industrial water and fire water.

B. Building Domestic Water

1. This system is used to provide for consumption and sanitary needs, industrial water needs, make-up water for mechanical system, and process water needs (i.e., DI, RO, etc.).
2. The service at the building shall provide the following
 - a. A reduced pressure backflow prevention device (RPBP).
 - b. Shut off valve.
3. An accessible main strainer with "blow down" capabilities to prevent well water sediment from reaching building's water supply and fixtures. Strainer shall be #20 mesh (1/32-inch).
4. Water pressure calculations should be performed for the project to determine the need for a booster pump. Water booster pumps shall be controlled with VFDs in lieu of hydraulic controls. Booster pump systems shall have a minimum of two pumps and a hydropneumatic tank. Request a water pressure test for all new buildings during project SD or DD phases.
5. Incoming domestic water shall be plumbed with injector fittings for water system chlorination testing.

6. Domestic water service inside each building shall provide the following
 - a. Specify isolation valves on branch lines serving each floor and at each equipment connection to facilitate maintenance and future building renovation projects. Develop a plan to shut-off patient rooms and multi-person occupancy toilet rooms that minimizes the impact on adjacent rooms & areas.
 - b. In large floors (40,000 square feet or larger) specify isolation valves for every quadrant or for each department.
 - c. Specify accessible water hammer arrestors for hot and cold water supplies to each quick-closing plumbing fixture (e.g., water closet, urinal, dishwasher, washing machine, clinic sink, food service hand-held sprayers, etc.) in accordance with the American Society of Sanitary Engineers Standard 1010, Water Hammer Arrestors. Size and locate arrestors per Plumbing Drainage Institute (PDI) Standard PDI-WH 201, Water Hammer Arrestors, latest edition, requirements.
 - d. For renovation projects, dead-end piping shall be removed in the area of the renovation back to the nearest active main or branch line. Empty risers, mains, and branch lines stubbed with line size shut-off valves for future use are permitted. These requirements apply to all domestic water utilities.
 - e. For potable hot water systems, specify a recirculation loop that serves all areas of the facility. Specify a digital recirculating system that includes a variable speed drive (VFD), and control points for the recirculation pump that are monitored through the Building Management System.
 - f. Specify a preset digital water tempering system that includes a high-level water alarm, for stored potable hot water of 140 degrees F and above. Specify high temperature alarm with shut-off valves per code. System shall include control points that are monitored through the Building Management System (BMS).
 - g. Insulate domestic cold-water piping when routing occurs through unconditioned spaces (e.g., mechanical room, sterilizer room, etc.) or through uninsulated soffits. Insulate domestic hot water system components to maintain piping temperature throughout the system. Isolation valves are to be uninsulated.
 - h. Extend insulation on piping system components which are subject to condensation.
 - i. Do not use once-through potable water for medical equipment cooling.
- C. Hose Bibbs
 1. Exterior Hose Bibbs: Shall be served by industrial or utility water services (where possible). Provide at 100 feet maximum spacing along exterior walls. Vacuum breaker, loose key handle, ¾ inch hose outlet, chrome-plated rough bronze, and vandal proof.
 2. Interior Hose Bibbs: Vacuum breaker, loose key handle, ¾ inch hose outlet, chrome plated brass, vandal proof.
- D. Backflow Preventers

1. Provide lead-free reduced pressure principal backflow preventers consisting of assembly, including shutoff valves on inlet and outlet, and strainer on inlet.
 2. Backflow preventers shall include test cocks, and pressure-differential relief valve located between two positive seating check valves.
 3. Strainers upstream of devices with union, with a minimum blowdown ball valve that is piped to and terminated at the nearest floor sink with a turned down elbow.
 4. Install no higher than 5 feet above finished floor, 12" minimum from floor, 12" minimum from wall.
 5. The building plumbing systems shall have appropriate shut off valve zoning to allow for ease of maintenance with minimal shutdown impact to building occupants. Shut off valves shall be provided on each system to isolate each toilet room. At minimum, shut off valves shall be provided for the following: each floor, each toilet room, each laboratory room, each equipment room, and each kitchen.
- E. Piping
1. Domestic Cold Water
 2. Underground: Type K copper tubing, hard temper, cold drawn.
 3. Above Ground: Type L copper tubing, hard temper, cold drawn.
 4. Above and below grade: Type L copper tubing
 - a. 1-1/2 inches and below: hard drawn.
 - b. 2 inches and above: hard temper, cold drawn
 5. Domestic Hot Water
 - a. Underground: Pipe shall be type K copper with brazed joints in powder insulating fill material, Gilsulate 500 XR, or equal.
 - b. Above Ground: Type L copper tubing, hard temper, cold drawn.
- F. Joints
1. Copper Tubing: All above grade piping, 1-1/2" and larger, and all below grade piping, regardless of size, shall be brazed with silver solder 1000 degrees F. All joints 1-1/4" or less are allowed to be soldered for pipes above ground.
 2. Install 6" long brass nipple, dielectric transition at points where dissimilar metal pipes connect together, gas and water services connections into the building within 5' of the building wall.
- G. Fittings
1. Copper tubing: Wrought copper or cast brass solder sweat type.
- H. Unions and Flanges
1. Unions and flanges shall be provided at the inlet and outlet of all apparatus and equipment, at all valves, and elsewhere as required to facilitate removal of valves and equipment. Flexible lines shall not be used. When connecting dissimilar metals, use brass nipples. Do not

use devices with plastic components in contact with the flow stream.

2. Two inches and smaller ground joint shall be cast bronze unions. cast brass unions.
3. Two-and-one-half inches and larger shall be 150-pound flange, cast brass.

I. Water Booster Pumps

1. Performance Requirements: Provide a multistage vertical pump system equipped with an integral electronic transducer controlled variable frequency drive, complete controls, and an expansion tank for reduced pump on/off sequencing.
2. Products: Grundfos, Canaris, or equal
3. Ensure 30 psi for flush valves available pressure for all top floor fixtures or otherwise a booster pump shall be provided. Provide 20 psi for all other fixtures.

J. Water Hammer Arrestors

1. Air chambers 18 inches long and 1 pipe size larger than rough-in shall be installed at branches to plumbing fixtures. At solenoid valves and make-up valves, provide diaphragm type shock absorber, sized, and located in accordance with Plumbing and Drainage Institute Manual WH- 201.
2. Provide shut-off valves and access panels for arresters.
3. Water hammer arrestors shall be certified under P.D.I. Standard WH201 and by ASSE Standard 1010.
4. Install above ceilings or behind wall access door at each plumbing fixture, or where plumbing fixtures are installed in groups, at each group of fixtures.
5. Locate water hammer arrestors at every plumbing fixture, or where fixtures are located in groups and at every group of fixtures.

K. Valves

1. Bypass loops are recommended at all major pieces of equipment.

L. Hose Bibbs

1. Exterior Hose Bibbs shall be served by industrial or utility water services and not from the domestic water supply. Provide at 100 feet maximum spacing along exterior walls. Provide vacuum breaker, loose key handle, 3/4-inch hose outlet, CP rough brass, vandal proof.
2. Interior Hose Bibbs shall have a vacuum breaker, loose key handle, 3/4-inch hose outlet and chrome plated brass and vandal proof.

M. Backflow Preventors

1. Where required, provide backflow preventers to separate industrial water from domestic water, on make-up water to hydronic systems, and any other locations where prevention of backflow is critical for safety.
2. On industrial water for labs, provide parallel backflow prevention devices sized at 50 percent of the flow each.
3. On make-up water to hydronic systems, provide a single backflow prevention device.
4. Reduced pressure type, with air gap fitting and piped to nearest floor drain.

5. Backflow prevention devices shall be located for easy access for maintenance. They shall not be installed higher than 5-feet above the finished floor, in ceilings, or in concealed spaces.
6. Refer to list of backflow prevention assemblies published by University of Southern California -

Foundation for Cross-Connection Control & Hydraulic Research (USC-FCCCHR). Where required by the University Representative (laboratory, housing, food service buildings, etc.), provide backflow preventers. Review sizing of parallel dual backflow preventers with the University Representative.

N. Floor Drains

1. Provide flashing ring and clamp at floors with waterproofing membrane. Adjustable set top with the top of the drain installed slightly below the finished floor to insure drainage.
2. Install vented P- trap below each drain including trap primer connection.
3. All toilet rooms, laundry rooms and first floor trash rooms shall have floor drains.

FACILITY SANITARY SEWERAGE

22 13 00

A. General Requirements

1. No reducing couplings allowed.
2. Sewer lines at toilet room vanities shall be designed properly with sweeps rather than "Ts" to allow for snaking when blockage occurs.

B. Floor Sinks

1. All mechanical spaces shall be provided with floor sinks.

C. Floor Drains

1. Install vented P- trap below each drain. Provide trap primer connection for drains with infrequent use.
2. All toilet rooms with more than one toilet or a toilet and urinal, laundry rooms and first floor trashrooms shall have floor drains.

D. Trap Primers

1. Install with Type L, hard copper piping to trap primer connection on floor drains and floor sinks with infrequent use.
2. Install trap primer piping to ensure that the line will drain fully to the floor drain or floor sink.
3. Provide a ball valve to the inlet at each trap primer location.
4. Mount trap primer in wall. Size access door and box to suit valve operation. Provide locking door when installed in occupied spaces.
5. Where one trap primer will be used for more than one trap, provide a distribution unit with feeder piping for a maximum of four traps sized for equal pressure drop to each trap.

E. Drain and Waste Piping

1. Include a statement of the sewer pipe design slope in the project

Basis of Design. Record any slope restrictions and proposed design solutions.

2. Coordinate with the local Utility District and Health Department to determine if kitchen waste requires a grease removal system.
3. Do not specify sump pumps in elevator pits, unless otherwise required by the State of local jurisdiction.
4. Pipe and Fittings
 - a. Cast iron soil pipe and fittings, asphaltic coated, conforming to ASTM A888 and Cast-Iron Soil Pipe Institute Standard (CISPI) 301 and so marked. Pipe and fittings shall be as manufactured by AB&I, Charlotte, Tyler Pipe, or equal. Pipe and fittings shall be the products of a single manufacturer.
 - b. Horizontal cast iron piping (waste and vent) shall have hangers installed on each side of piping and fitting joints. Hangers shall be within 18" of the joints.
 - c. Joints above grade: No-Hub pipe conforming to ASTM A888 and CISPI 301.
 - d. Couplings conforming to ASTM 1277 and CISPI 310, with stainless steel bands.
 - e. Joints below grade: Couplings and No-Hub fittings, meeting the requirements of FM 1680, SD Class I and ASTM C1540.
 - f. UCHD will only accept the use of Husky 4000, stainless steel four band couplings.
 - g. No reducing couplings allowed. Sewer lines at toilet room sinks shall be designed properly with sweeps rather than "Ts" to allow for snaking when blockage occurs.
5. Vent Pipe
 - a. 3 inch and larger: Cast iron soil pipe and fittings conforming to ASTM A888 and Cast-Iron Soil Pipe Institute Standard 301 and so marked.
 - b. 2-1/2 inch and smaller: Cast iron soil pipe and fittings, or DWV copper pipe and fittings. (Galvanized Pipe not allowed)
 - c. Vent pipe buried in ground and to 6 inches above ground: Cast iron soil pipe and fittings conforming to ASTM A888 and Cast-Iron Soil Pipe Institute Standard 301 and so marked. Joints in cast iron vent pipe shall be the same as specified for cast iron waste pipe below ground.
 - d. Type DWV copper tubing or No-Hub cast iron pipe and fittings may be used for concealed drainwater leaders. Where no-hub piping is used, the fittings and couplings shall match those used for waste piping.
 - e. Vent pipe above ground: 3 Inches and Larger: Service weight cast iron soil pipe and fittings; 2- 1/2 inches and smaller: Schedule 40 galvanized steel pipe with black cast iron drainage fittings.
6. Condensate Drain Piping
 - a. Inside buildings provide ASTM B88, Type L copper tubing and

fittings. Provide Wye fittings with capped cleanout plug for tubing up to 1 inch size. Provide wrought or cast DWV fittings for sizes 1-1/4 inch and larger. Drainage fittings shall be used for condensate piping.

- b. Outside buildings provide ASTM B88, Type L copper pipe and fittings, cast iron drainpipe and fittings or Schedule 40 galvanized steel pipe and cast-iron drain or vent fittings.
- c. Connect condensate drains to mechanical equipment per equipment manufacturers recommendations; provide P-trap where required. Slope piping to drain, with 1 inch in 10-foot minimum pitch. Provide di-electric couplings or unions at connections to dissimilar materials.
- d. Mechanical equipment on spring isolation rails or spring mounted curbs provided with threaded metal connector at mechanical equipment, Metraflex Model SST or BST, Unisource Mfg. Co. "V" connector, or equal, CSA listed for 4 inches of movement. Arrange flexible connection to ensure drainage of condensate under all installation conditions and arrange for support of flexible connection at each end of the connector, to ensure alignment at all times.
- e. Where condensate drain P-traps are required, install trap using Wye fitting on inlet and outlet of trap. Provide cap on top of each Wye, made removable for cleaning and inspection. Drill 1/8-inch diameter hole in cap at outlet of the trap to allow venting of the system. Minimum depth of trap should be 4 inches, or as recommended by the manufacturer in printed literature.
- f. Provide cleanout tees or "Y" at each change in direction.
- g. Condensing-Type Equipment Condensate Drainpipe: CPVC pipe and fittings conforming to ASTM 2618.
- h. Provide CPVC condensate drainpipe for condensing water heaters, furnaces, and where shown on Drawings.
- i. Provide continuous support for horizontal piping.
- j. Piping and fittings shall be as manufactured by Spears Manufacturing, Charlotte Pipe, and foundry Co., or equal.

F. Piping

- 1. Underground: Service weight cast iron no-hub or hub & spigot joined with compression gaskets.
- 2. Above ground
 - a. Greater than 2-inch service weight cast iron no-hub with stainless steel and neoprene coupling.
 - b. Less than 2-inch service weight cast iron no-hub with stainless steel and neoprene couplings, or schedule 40 galvanized steel pipe joined with Durham type threaded drainage fittings.
- 3. General Requirements
 - a. Service weight cast iron.
 - b. Above or underground no hub waste piping must use 4-band couplings.

- c. No hub waste vent piping may utilize 2-band couplings.
- G. Sanitary Sewer Ejector
 - 1. General Requirements: Flow controls set as individually operated; provide units without chopperblades; units shall be counter balanced.
- H. Drip Pans
 - 1. A. Install drip pans under storm drain piping, sanitary drain piping, and vent piping that must berun over kitchen areas.
 - 2. Drip pans located directly below hydronic piping or similar sources of possible damage shall beprovided to protect electrical and electronic work which is sensitive to moisture.
 - 3. Pans shall be 2" deep, extending a minimum of 6" beyond each edge of overhead piping andlengthwise 18" beyond each side of electrical work to be protected.
 - 4. Fabricate pans of either 20-gauge copper or 16-gauge zinc-coated steel, with rolled edges andreinforced for proper support, soldered fully watertight, and fitted with a copper drainpipe property discharged.
 - 5. Mechanical work drip pans shall be provided for roof and overflow drain, and sanitary soil and waste piping located above food preparation centers, food service facilities, food storage areas,and other critical areas to protect the areas below.

FACILITY STORM DRAINAGE

22 14 00

- A. General
 - 1. The maximum allowable size for storm drains is 12 inches.
 - 2. Locate overflow drain lines away from the building facade and in sunlight to prevent waterstaining.
 - 3. If a pump is required, locate it outside of the building.
 - 4. Do not drain outside building sub-soil drains to interior sump pumps.
 - 5. Insulate all horizontal piping runs inside buildings.
 - 6. Roof and overflow drains shall be piped independently to outside.
 - 7. Overflow drain piping shall be day-lighted through exterior wall, minimum 18-inches above grade.
 - 8. Surface drains and building foundation drains will be provided as necessary.
- B. Piping
 - 1. Same as above Section 22 13 00 - Facility Sanitary Sewerage.
- C. Drains
 - 1. Area Drain: Provide heel proof grate for public walk areas and traffic grate with locking clips &retained bolts for traffic areas.
 - 2. Roof/Overflow Drain: Cast iron with flange, flashing ring, gravel stop, underdeck clamp, extension, sump receiver, 6" high cast iron vandal

proof dome type strained inlet and clamping collar.

3. Rainwater leader nozzles shall be provided on all piping that terminate at the exterior face of the building. Nozzle body shall be bronze with threaded inlet and bronze wall flange with mounting holes. Size nozzle to match connected pipe.

PLUMBING EQUIPMENT

22 30 00

- A. Domestic water softeners
 1. Performance Requirements
 - a. Equipped with an electro-mechanical metered valve.
 - b. Valve bodies shall be lead-free brass.
 2. Products: Valve: Fleck, or equal.
- B. Carbon filters
 1. Performance Requirements
 - a. Equipped with an electro-mechanical metered valve.
 - b. Filter shall be activated carbon and regenerated by a backwash cycle.
 2. Products: Valve: Fleck, or equal.
- C. Provide neutralizing Basin for acid waste.
 1. Furnish sufficient limestone or marble chips in chunks 1 inch to 3 inches in size to fill the tank to within 2 inches of the outlet. Place this material in the tank at the completion of the work.
- D. Commercial Electric Water Heaters
 1. Commercial electric water heaters that comply with ASHRAE 90.1 for energy efficiency. Provide UL listing. Relief valve dip tube shall extend to within 3 inches of tank.
 2. Warranty: Furnish three-year minimum warranty on tank leakage.
 3. Provide the following accessories
 - a. Brass drain valve
 - b. 3/4-inch temperature and pressure relief valve
 - c. Thermometer
- E. Instantaneous Point-of-Use Electric Water Heaters
 1. Cabinet mounted stainless steel electric heating style. Flow switch activated, UL listed, 150 PSI rated.
 2. Point-Of-Use instantaneous electric water heaters shall only be used for remote located fixtures or at fixtures with limited use.
- F. In-line Domestic Hot Water Recirculation Pumps
 1. Provide in-line domestic water recirculation pumps where indicated on Drawings and of capacities as scheduled on Drawings.

2. Pumps shall be of the centrifugal type with non-overloading characteristics and shall not overload the motor above its nameplate horsepower rating under any operating condition. No allowance for service factor shall be used in pump selection. Motor horsepower shown is minimum; furnish larger motors, if necessary, to meet the non-overloading requirements.
- G. Concrete Grease Interceptors
 1. Furnish and install a concrete grease interceptor with minimum capacity as required by the local jurisdiction. Provide manholes to grade for access to each section. Provide cast-iron ring and cover at grade for each manhole.
- H. Domestic Water Booster Pumps
 1. Specify floor-mounted, open drip proof, centrifugal pumps. Select pump speed not to exceed 1750 RPM and with the following minimum efficiency
 - a. Specify variable speed booster systems.
 - b. Ensure that Variable Frequency Drives (VFD) communicate with the Building Automation and Control Networks.
 - c. Hospital Buildings: As a minimum level of redundancy, use a triplex pump system.
 - d. Size each pump for 50% of the total water demand. Specify a pneumatic tank and "NOFLOW" shutdown controls.

COMMERCIAL PLUMBING FIXTURES

22 42 00

- A. General Requirements
 1. Provide fixtures and trim listed here in this section. Alternate or special fixtures not listed shall be presented to the University Representative for review and written approval.
 2. Provide all water supplies to fixtures with shut-off stops with IPS inlets with threaded brass nipples at pipe connection and lock shield-loose key. Provide combination fixtures with I.P.S. stop on each water supply fitting. Provide loose key handle for each stop.
 3. Provide 3/8" risers for all sinks and lavatories.
 4. Provide fixtures not having integral traps with "P" traps of chromium-plated cast brass connected to concealed waste in wall and sanitary fittings. Provide 17-gauge minimum traps and tailpieces.
 5. Install wall-mounted vitreous china fixtures with combination support and waste fittings, with feet of support securely anchored to floor.
 6. Bottle Filling Stations: Provide at least one per building, located at the ground floor.
 - a. Individual bottle filling stations shall be installed at an accessible height. The unit shall be lead-free; contain bayonet style, non-proprietary, built-in filtration system and shall include antimicrobial protection. Basin shall be designed to minimize splashing and

- standing water.
- b. Refrigerated units to be provided if installed above the second floor or if piping passes through an unconditioned basement. Verify refrigeration requirements with the University Representative. If drinking fountains are to be installed, provide a combined fountain/bottle filling station unit.
- B. Products: Fixtures shall be American Standard, Zurn, or an equal approved by the University Representative.
1. Provide stops for all concealed supplies.
 2. Faucets serving hand wash sinks in restrooms, public and private (patient) shall be domestic made, with washerless spring and cup seal. Single Lever with ceramic disk and temperature limit stop or equal.
 3. Electronic infrared sensor faucets shall have integral battery backup and offer extra-long ranging capabilities.
 4. Where applicable, consider the use of turbine, self-generating power, sensor operated faucets.
 5. Electronic infrared sensor flush valve shall operate on battery power and contain a TPE chloramine resistant filtering diaphragm.
- C. Water Closet (WC-1): Floor mounted, ADA compliant with rear discharge. Vitreous china, top-spud, siphon jet, 1.28 GPF flush valve containing a TPE chloramine resistant filtering diaphragm. Where used for handicapped water closets, the flush valve shall be mounted on the wide side of the toilet enclosure. Complete toilet assembly (bowl and flushometer) shall have a Maximum Performance (MaP) flush score of 1000 and be WaterSense labeled.
- D. Urinal (UR-1): Wall Hung, ADA compliant, vitreous china, top-spud, 0.125 GPF flush valve containing a TPE chloramine resistant filtering diaphragm. Complete urinal assembly (urinal and flushometer) shall be WaterSense labeled.
- E. Lavatory (L-1): 19 x 16 Under Mount vitreous china lavatory with metering faucet with ceramic disk and temperature limit stop, grid drain, 17-gauge seamless brass P-Trap less trap screw cleanout with chrome plated cast brass body, brass connection nuts, wall return and chrome plated wall escutcheon to match trap finish.
1. For handicapped application use offset grid drain and insulate hot water and drain piping exposed below lavatory.
 2. Provide 0.5 GPM laminar flow restrictor at faucet fitting or in supply line.
- F. Lavatory (L-2): 20 x 18, Wall Hung, vitreous china lavatory for concealed arm support, metering faucet with ceramic disk and temperature limit stop, 17-gauge seamless brass P-Trap less trap screw cleanout with chrome plated cast brass body, brass connection nuts, wall return and chrome plated wall escutcheon to match trap finish.
1. For handicapped application use offset grid drain and insulate hot water and drain piping exposed below lavatory.
 2. Provide 0.5 GPM flow restrictor at aerator or in supply line, or equal.
- G. Mop Sink (MS): Floor mounted, terrazzo with faucet that includes vacuum breaker, wall

support,
integral check stops, 5' hose and hose bracket mounted with stainless steel.

- H. Bottle Filling Stations: Provide at least one per building, located at the ground floor. Individual bottlefilling stations shall be installed at an accessible height. The unit shall be lead-free; contain bayonet style, non-proprietary, built-in filtration system; and shall include antimicrobial protection. Basin shall be designed to minimize splashing and standing water. Refrigerated units to be provided if installed above the second floor or if piping passes through an unconditioned basement. Verify refrigeration requirements with the University Representative.
- I. If drinking fountains are to be installed, provide a combined fountain/bottle filling station unit such as

Elkay EZH20 System Cooler/Bottle Filling Station, Oasis Universal Barrier-Free VersaCooler II with VersaFiller, or equal.

- J. Water Closet: Wall hung, vitreous china, siphon jet action, Maximum Performance (MaP) tested by IAPMO to exceed 500g capacity. Provide white, open front seat, less cover. Seat: White, heavy-duty, commercial type, elongated, open front, solid plastic, with stainless steel hinge. Cast iron floor mounted carrier. Dual level water-conserving flush valve (1.1 and 1.6 gal/flush). Height of flushometer valve shall allow for maintenance in locations with ADA grab bar. Contact the University Representative for use of electronic sensing systems. Water closet: American Standard, or equal.
Flushometer: Zurn, Sloan, or equal
- K. Urinal, Accessible: Wall hung, vitreous china.
 - 1. Wall hung, ultra-low flow 0.125 GPF, vitreous white china with in-wall carrier.
 - 2. Provide cast iron floor mounted carrier, ultra-low flow (0.125 gal/flush).
 - 3. Cartridge free, liquid type waterless urinal, Kohler or equal.
 - 4. The University Representative shall consult with Engineering, Facilities Custodial and Plumbing offices prior to approval.
 - 5. For renovations, existing piping network shall be evaluated for size and slope.
 - 6. Side discharge units are not acceptable.
 - 7. Flushometer: Exposed, diaphragm-type, manually operated, ultra-low flow 0.125 GPF. Contact the University Representative for use of electronic sensing systems.
 - 8. Products: Zurn, Sloan, or equal
- L. Lavatory: Wall hung, vitreous china, 20-inch by 18-inch.
 - 1. Sanitary waste traps for equipment shall be "P" type, 17 gauge, cast brass, slip joint nuts, cast brass escutcheons, and cleanout plug.
 - 2. Visible traps should be chrome plated unless the project requires special finishes.
 - 3. 4-inch center vitreous china, with concealed carrier arm
 - 4. Products: American Standard or equal
- M. Faucet: Manually operated, single control center set, 0.5 gpm, vandal

resistant, pressure compensating multi-laminar spray. Contact the University Representative for use of electronicsensing systems.

- N. Sink (Counter Mounted): 18-gauge, type 304 stainless steel sink counter mounted, single bowl, 19 - inch by 18-inch by 10-inches deep stainless steel. Deck mounted low flow faucet, lever handle, gooseneck, rigid spout plain outlet. 17-gauge chrome plated 1-½-inch by 1-½-inch trap. Products: Elkay, Just, or equal.
- O. Drain: 1-½-inch tailpiece, grid strainer. Where domestic water is untreated or unconditioned, use manual low flow fixtures.
- P. Laboratory Faucets: Self-closing, deck-mounted, gooseneck spout with replaceable stainless-steel seat. Faucet shall be fully assembled, and factory tested prior to shipment. Water Saver, Chicago, or equal.
- Q. Shower Valve
 - 1. Performance Requirements: Pressure balancing, four port, quarter turn stops.
 - 2. Products: Moen, or equal.
- R. Laboratory sinks, general purpose
 - 1. Performance Requirements
 - a. Epoxy resin, under-counter mount, chemical resistant
 - b. Faucet: Deck-mounted, gooseneck spout, replaceable stainless-steel seats, built in stops; self-closing for D.I. applications
 - 2. Products
 - a. Sink: Durcon or equal
 - b. Faucet: Water Saver, Chicago, or equal.
- S. Laboratory Sinks used for dry ice disposal
 - 1. General Requirements: Provide one per laboratory
 - 2. Performance Requirements
 - a. Sink: 18-gauge, type 304 stainless steel
 - b. Faucet: Deck-mounted, gooseneck spout, replaceable stainless-steel seats, built in stops
 - 3. Products
 - a. Sink: Elkay, Just, or equal
 - b. Faucet: Water Saver, Chicago, or equal.
- T. Drain: 1-1/2 inch tailpiece, grid strainer.

EMERGENCY PLUMBING FIXTURES

22 45 00

A. General

- 1. Emergency eye or eye/facewash equipment shall be provided in all work areas where, during routine operations or foreseeable emergencies, the eyes of an employee may come in contact with a substance which can cause corrosion, severe irritation, or permanent tissue damage or which is toxic by absorption. Shall be provided if

there will be processes that produce flying particles, including sawdust, metal shavings, biological agents, etc. This equipment shall meet the performance and installation requirements of American National Standards Institute (ANSI) Z358.1 1998 (*current version*). UC Davis Health's EH&S shall make final determination on selection of equipment to ensure the equipment meets this standard.

B. Emergency Eye Wash and Showers

1. The units shall be
 - a. Supplied by domestic water.
 - b. Readily visible and accessible to the laboratory or work site. The unit should be located as close to the hazard as possible and cannot be blocked by building structures, cabinets, supplies or equipment.
 - c. Provided with an activation device, such as stay open ball valve, that allows the user full movement of both hands after the valve is turned on.
 - d. Identified with a highly visible sign.
 - e. Drain shall be plumbed to sanitary sewer.
 - f. Located so as not to pose an electrical shock hazard. No electrical outlets within 6 feet unless GFI protected.
 - g. Indoor units are not required to deliver tempered water. Units installed outdoors or in adverse climates may need to be tempered. The need for tempered water shall be reviewed by the University Representative and EH&S during the design phase.

C. Emergency Eye Wash

1. Emergency eye or eye/face wash units are Haws 7611 or Guardian G1805 (laboratory unit - install at sink), Haws 7000BT or Guardian G1750PT (Barrier Free), Haws 7656WC or Guardian GBF 1735DP (recessed), or equal.
2. In addition to the requirements above, the units shall be
 - a. Regulated to provide a spray force of three to six gallons per minute at 30 psi.
 - b. Mounted such that the water nozzles are 33-inches to 45-inches from the floor level; and 17 to 25-inches from bowl edge, wall, or obstruction; height should comply with Americans with Disabilities Act of 1990 (ADA) requirements and at least 34-inches of clearance around the eyewash must be maintained.
 - c. Mounted so that spray nozzles, when activated, are no more than 18 inches from the counter front when located above work counters or benches.
 - d. Drain shall be plumbed to sanitary sewer.
 - e. For laboratory units installed at sinks, provide eyewash unit which swings spray head assembly over sink activating continuous flow of water.
 - f. For Barrier Free units, provide wall-mounted, low-profile eyewash

with plastic receptor and aluminum wall bracket.

- g. For recessed units, provide swing down eyewash in a fully recessed wall mounted stainless steel cabinet with drain pan.

D. Emergency Showers

1. The unit shall be installed and located so both the shower and eyewash can be used at the same time by one person. Eyewash/emergency shower units are Haws 8346 or Guardian G1909 HFC (GBF1909 Barrier Free), Haws 8355WC (recessed), Guardian GBF2150 (recessed), or equal. Eyewash component shall meet the requirements for Emergency EyeWash above. In addition to the requirements above, the units shall be:
 - a. Adequately supplied with potable water to meet the requirements of each component. The shower shall be able to deliver a minimum of 30 gallons per minute. The diameter of the water pattern of the shower measured 60 inches above the surface on which the user stands shall be a minimum of 20-inches. The center of the spray pattern shall be located at least 16-inches from any obstruction.
 - b. Supplied by a minimum pipe size of 1 inch.
 - c. Installed so that the shower head is not less than 82-inches nor more than 96-inches from the surface on which the user stands.
 - d. Shower component activated yearly to verify proper operation.
 - e. Emergency shower with integral eyewash unit is required if during routine operations there is a risk of a splash of corrosive or other skin hazardous material to the body.
 - f. Units shall be adequately supplied with potable water to meet the requirements of each component.
 - g. A combination eyewash/emergency shower shall be located within a research laboratory using hazardous chemicals; or a combination eyewash/emergency shower may be located outside the laboratory provided an eyewash is located in the laboratory. The combination unit shall be located so that travel distance is no more than 10 seconds or 100 feet with no obstructions and only one door to pass through to reach the unit.

COMPRESSED AIR SYSTEMS FOR LABORATORY AND HEALTHCARE FACILITIES

A. General

1. Identify the design and installation requirements for compressed air quality, pressure and flow to meet project specific requirements.
2. Provide lead/lag compressors for systems requiring 10 HP compressors or larger, i.e., split one 10 HP compressor into two 5 HP lead/lag compressors.
3. Provide inter-cooled and after cooled, 2 stage compressors/pumps for all 5 HP systems and larger. Once through cooling water systems are prohibited.
4. Points of connection to existing copper air piping in existing buildings shall be crimped or compression type fitting. Soldering is

not permitted.

- B. Piping
 - 1. Above Ground: Type L copper tubing, hard drawn.
 - 2. Below Ground: Type K copper tubing, hard temper, cold drawn with brazed joints.
- C. Joints
 - 1. Silver brazing alloy, melting point above 1000 degrees F, 15 percent silver, 80 percent copper 5 percent phosphorous.
- D. Fittings
 - 1. Wrought copper or brass, solder sweat type. Couplings shall be of the staked stop type.
- E. Valves
 - 1. Ball valves
- F. Lab Air Outlets: Line size, Ball valve or needle valves to match project requirements.
- G. Refer to Section 22 63 00 for Ultra Pure system requirements.
- H. Compressed air systems
 - 1. General Requirements:
 - a. Identify the design and installation requirements for compressed air quality, dew point, pressure, flow, and volume to meet project specific requirements.
 - b. Compressors shall be oil-type except for medical or dental applications. Refer to Section 2263 00 for Ultra-Pure system requirements.
 - c. Buildings utilizing compressed air for laboratory functions and HVAC systems shall have separate compressors.
 - d. Provide refrigerant dryers. In locations where refrigerant dryers cannot be used, consult the University Representative. If desiccant dryers are to be used, they shall be capable of standby mode. Desiccant dryers shall not be used in small air compressor applications.
- I. Air Compressors
 - 1. Provide lead/lag compressors for systems requiring 10 HP compressors or larger, i.e., split one 10 HP compressor into two 5 HP lead/lag compressors.
 - 2. Provide inter-cooled and after cooled, 2 stage compressors/pumps for all 5 HP systems and larger.
 - 3. Provide single stage compressors only for applications requiring 100 pounds or less.
 - 4. Once through cooling water systems are prohibited.
- J. Compressed Air Piping
 - 1. Above ground: Type L copper tubing, hard drawn.
 - 2. Below ground: Type K copper tubing, hard temper, cold drawn with brazed joints.
 - 3. Joints: Silver brazing alloy, melting point above 1000 degrees F, 15

percent silver, 80 percent copper 5 percent phosphorous.

4. Fittings: Wrought copper or brass; solder sweat type. Couplings shall be of the staked stop type.
5. Valves: Ball type.
6. Lab Air Outlets: Line size, Ball valve or needle valves to match project requirements.
7. Points of connection to existing copper air piping in existing buildings shall be screwed, soldered, or brazed, depending on system.

VACUUM SYSTEMS FOR LABORATORY AND HEALTHCARE FACILITIES 22 62 00

- A. General
 1. Identify the design and installation requirements for vacuum, pressure and flow to meet project specific requirements.
- B. Piping, Joints, Fittings, Valves and Lab Air Outlets
 1. See Compressed Air System requirements above.
- C. Vacuum Pump
 1. Furnish air-cooled duplex vacuum unit, Ingersoll-Rand, Worthington, or equal. Unit to come complete with base mounted pumps, American Society of Mechanical Engineers Association (ASME) tank with sight glass, drain, flexible connection, scrubber, check valves, relief valves, control panel including fused disconnect, vacuum switches and gauges, motors, starters, electrical alternator.
 2. NEMA rating shall be specified based on the location of equipment.
- D. Vacuum Pump Products: Ingersoll-Rand, Or Equal.

GAS SYSTEMS FOR LABORATORY AND HEALTHCARE FACILITIES 22 63 00

- A. Specialty Gases
 1. General Requirements
 - a. This section applies to laboratories that require Ultra Pure piping system for special gases including compressed air, nitrogen, oxygen, CO₂, Argon, etc.
 - b. Identify the design and installation requirements for quality, pressure and flow for all specialty gasses to meet project specific requirements.
 - c. Grounding: All oxygen, nitrous oxide and vacuum lines shall be grounded to the water supply system to reduce the possibility of static electric charges.
 2. Performance Requirements
 - a. Comply with NFPA 99 requirements for Gas and Vacuum Systems. Although this standard

applies to Health Care systems, the requirements noted in this standard shall be applied for special lab air system.

- b. Screwed Connections: Wherever possible, screwed joints made in attaching valves, or other permanently connected equipment shall be silver brazed after assembly using precautions to avoid overheating the valve or equipment. Where conditions do not permit this method of assembly, the connection joints shall be tinned or sweated with solder. No joint compound shall be used.
3. Products: Nitrogen and Argon: Plug Shutoff Valve; Circle Seal 9259 with Buna-N O-ring, or equal (no known equal).

MEDICAL GASES

22 63 13

Medical Gas spec requirements shall be coordinated with the University Representative during the design phase.

CHEMICAL WASTE SYSTEMS FOR LABORATORY AND HEALTHCARE FACILITIES 22 66 00**A. General**

1. Coordinate with the local jurisdiction and the University Representative if chemical drainage is required to pass through an acid-neutralizing tank before connection to the building sanitary sewer system. When an acid-neutralizing tank is required, specify a Ph sensor and a point to monitor through the Building Management System.

B. Piping

1. All piping shall be Schedule 40 flame retardant polypropylene pipe and fittings joined with fusion coil joints, Enfield "Enfusion" or equal, except piping around the benches and equipment shall have mechanical joint fittings by Enfield, "Labline" or equal. Compression fittings are not allowed.
2. Above ground accessible: Schedule 40 flame retardant polypropylene pipe and fittings joined with grooved pipe mechanical joint fittings by Enfield "Labline" or equal. Compression fitting is not acceptable. All acid waste piping around benches and equipment shall have mechanical joint fittings. Chemically resistant glass drain line piping may be used for repair of material in existing buildings only.

C. Traps

1. Universal, 1-½-inch Polypropylene clear base, Enfield W5115, Harrington or equal. Acid waste traps for equipment shall be Nalgene 96025-1500, Sloane, or equal, drum trap with drain connection adapter and union connection. Sanitary waste traps for equipment shall be "P" type, 17 gauge, cast brass, slip joint nuts, cast brass escutcheons, and cleanout plug. Visible traps should be chrome plated unless the project requires special finishes.

D. Supports

1. Horizontal polypropylene piping shall have a continuous 16-gauge galvanized sheet metal trough support or maximum 2-foot support

spacing system.

E. Fixtures

1. Funnel Sink: Cast iron, with trap and 6-inch diameter inlet.
2. Cup Sink: Polyethylene, oval with integral waste fitting, 1-½-inch with polypropylene trap.

F. Piping

1. Performance Requirements:
 - a. New construction: Schedule 40 flame retardant polypropylene pipe
 - b. Existing buildings with glass piping: Chemically resistant glass drain line piping may be used for repair of material or polypropylene with adaptors.

G. Fittings

1. Performance Requirements
 - a. General: fusion coil joints
 - b. Provide mechanical joint fittings at all piping around benches and equipment, above ground and accessible piping, and all acid waste piping.
 - c. Compression fittings are not allowed.
2. Products
 - a. General piping: Enfield "Enfusion" or equal in walls or ceilings
 - b. Piping around benches and equipment, under and around sinks, and in accessible areas: Enfield, "Labline" or equal

H. Traps

1. Performance Requirements
 - a. Universal: 1-1/2-inch Polypropylene clear base
 - b. Acid waste and fume hood sinks: drum trap with drain connection adapter and union connection
2. Products
 - a. Universal: Enfield W5115, Harrington or equal.
 - b. Acid waste: Nalgene 96025-1500, Sloane, or equal

I. Supports

1. Performance Requirements: Horizontal polypropylene piping shall have a continuous 16-gauge galvanized sheet metal trough support or maximum 2-foot support spacing system.

J. Fixtures

1. Performance Requirements
 - a. Funnel Sink: Cast iron, with trap and 6-inch diameter inlet.
 - b. Cup Sink: Polyethylene, oval with integral waste fitting, 1-1/2 inch with polypropylene trap.

PROCESSED WATER SYSTEMS FOR LABORATORY AND HEALTHCARE FACILITIES

A. Processed Water Systems

1. System Design

- a. When program needs for new facilities require specially treated water supplies (e.g., deionized water for laboratory needs), these needs shall be met by providing on -site treatment systems. Such systems may include carbon filters, water softeners, reverse osmosis units, ion exchange systems, and ultraviolet light disinfection systems with ultra- filtration. Review with University Representative the project specific requirements for waterquality, quantity, pressure and flow to identify the design and installation requirements.
- b. Life-cycle costing shall be used to select system components (e.g., the use of resin beds vs. reverse osmosis units). Consideration should also be given during design for future needs in the facility and/or adjacent areas to allow for future expansion of local water treatment devices to meet higher flow and/or water quality requirements. Leased systems shall not be used to meet new facility needs.

2. Performance Requirements

- a. If Reverse Osmosis system is used, it shall have a regenerating type of softener withbackwashing carbon filters in lieu of exchange bottles.
- b. Deionized water systems shall be designed to provide for a minimum 1 megohm systemunless otherwise required by the University Representative. The system shall be recirculating (i.e., no 'dead legs').

B. Ultra-Pure Deionized Systems

1. Performance Requirements

- a. The system shall be recirculating through deionized polishing bottles.
- b. Piping, joints and fittings: Unpigmented (natural) polypropylene, copolymer Type
- c. Schedule 40 butt-fusion and/or socked fusion.
- d. The entire system shall be sterilized.

2. Products: For bench valves: use Chicago 828PVDF (solid PVDF valve), or equal

Description:	Use:	Quality:	Equipment:	Piping:
Domestic Water (DW), plain	Consumption, fixtures	Potable	None	Copper
Softened Water	Process equipment, dishwashing, cage-washing	A minimum of 95 percent of TDS removed	Softener	Copper

Softened + R.O.	Process equipment, consumption, feed water for D.I. system	5 percent or less of TDS and bacteria; 1-3ppm; approx.. 0.5 megohm	In addition to above: - Carbon Filter - R.O. Prefilter - R.O. System	Copper
Softened + R.O. + D.I.	Laboratory grade for non-critical purposes; lab equipment connections; Type I feed water	Type II or III, per ASTM D1193-6; verify with the University Representative	In addition to above: - U.V. stabilizers - 0.2 micron vinyl filter - Mixed bed Deionization bottles - Storage tanks - Distribution pumps	Schedule 80 PVC Stainless 304 and 316 (proposed material should be provided for approval to the University Representative during design phase)
Softened + R.O. + Ultra Pure D.I.	Critical laboratory applications; research/medical grade	Type I, per ASTM D1193-6	In addition to above: - Polisher	Hi-purity polypropylene

C. Piping, Joints, Fittings and Unions

1. General Requirements

- a. Metric sizes are not acceptable.
- b. Pipe shall be sterilized and capped prior to shipment. Fittings, unions and valves shall be sterilized and individually packaged after production.
- c. Sanitizing: Disinfection of Domestic Water Piping. Mixed beds shall not be connected to the distribution loop during sanitization.

2. Performance Requirements

- a. Pipe, fitting, unions and control valves manufactured of polyvinyl chloride PVC; Gray Standard Schedule 80 manufactured specifically for deionized water service.
- b. Joining shall be by socket weld, procedure as recommended by pipe manufacturer. No threaded joint or flexible connection shall be permitted.

01 - General Requirements

- c. No threaded joint or flexible connection shall be permitted.
- D. Valves
 - 1. General Requirements: Provide isolation valve at each sink.
 - 2. Control and Bench Valves: Ball type with tapered sockets with ball and seat compatible with piping materials. Use aluminum coupler to connect to bench valve.
- E. Bench Faucets
 - 1. Bench outlets: Self-closing, hot tin lined, deck-mounted, gooseneck spout with replaceable stainless-steel seat. Faucet shall be fully assembled, and factory tested prior to shipment. WaterSaver Pure Water Faucet, Chicago Pure Water Faucet, or equal.
 - 2. For foot operated outlets: floor mounted, tin-lined, self-closing renewable unit with stainless steel single valve system. Water Saver Tin-Lined, Foot-Operated Single Valve with manufacturer's recommended coordinating deck-mounted, tin-lined gooseneck spout, or equal.
- F. Supports
 - 1. Piping 2-inches and smaller and all horizontal piping shall have continuous 16-gauge galvanized sheet metal trough support or maximum 2-foot support spacing system.
- G. Cleaning
 - 1. All pipe, fittings, valves, and system-related materials shall be cleaned before use. Minimum requirements for cleaning procedures are:
 - 2. Alconox detergent and 30 percent hydrogen peroxide cleaning agents.
 - 3. Circulating pump.
 - a. 1 percent potassium permanganate testing solution.
 - b. The deionizer equipment may be used for cleaning the piping system.
- H. Ultra-Pure Deionized Systems
 - 1. Piping, joints and fittings: Unpigmented (natural) polypropylene, copolymer Type 1, Schedule 40 butt-fusion and/or socketed fusion. The system shall be recirculating through deionized polishing bottles. The entire system shall be sterilized. For bench valves for ultra-pure water, use Chicago 828PVDF (solid PVDF valve), or equal.

DESIGN CRITERIA

- A. Use the most recent American Society of Heating, Refrigeration & Air Conditioning Engineers (ASHRAE) Climatic Data for Region 12 to determine outside design conditions.
 - 1. For 100 percent outside air systems: 104 degrees dry bulb/70 degrees moisture content wet bulb (mcwb) based on 2019 Building Efficiency Standards Title 24 Part 6 Reference Appendices California Design Location Data Cooling 0.1% and the 0.2 percent winter conditions(30

- degrees).
2. For recirculating air systems: 101 degrees dry bulb/70 degrees mcwb) summer conditions and the 0.2 percent winter conditions (301 degrees).
 3. Special consideration shall be given to environmental conditions for certain projects such as animal facilities, pathology laboratories where maintaining temperature and humidity can be critical. The design shall be discussed with the University Representative, with a default starting point of 108F dry bulb for summer and 26F for winter.
 4. Submit cooling and heating load calculation for each individual zone in the building's HVAC system and sizing data for all applicable proposed equipment such as air handling equipment, pumps, etc., at the beginning of the construction document phase. Calculations to be performed using a standard HVAC load calculation program such as: Trane Trace, Carrier E20 or equal. Size cooling systems with an additional 10% safety factor for cooling and 20% safety factor for heating.
 - a. For interior temperature conditions other than special use in the building, hospital, research facilities and laboratory: 74+/-2F degrees for cooling and 70+/-2F degrees for heating.
 - b. Telecommunications Spaces (IDF, BDF rooms): Temperature range between 68- and 74-degrees F cooling; no heating. No Humidity Control unless requested by IT department. See further detail below.
 - c. For cooling tower selection use the 0.1 percent design wet bulb conditions (74 degrees). based on 2019 Building Efficiency Standards Title 24 Part 6 Reference Appendices California Design Location Data Cooling 0.1%.
 5. For all OSHPD projects system will be designed to maintain the temperatures and humidity as listed in California Mechanical Code Chapter 4. For areas not listed, use ASHRAE standard 170- (current version) or best engineering practices.
 6. Internal heat loads
- B. Lighting: Per Title 24, Part 6. Refer to Part 2 for additional requirements.
- C. Equipment: Per manufacturer's data or ASHRAE 2017 Fundamentals Latest edition, Ch.18.
- D. The following spaces are normally assumed to have no equipment load: Toilets, Locker Rooms, Showers, Corridors, Storage Rooms, Lobby
1. People: Per ASHRAE Fundamentals (current version), Ch. 18.
 2. The building pressure shall be slightly positive to ambient but allow exterior doors to close automatically. For building under OSHPD jurisdiction follow UMC recommendations.
 3. HVAC system noise: Design Classrooms, Libraries, Study Halls within NC 30, general office space within NC 38, Lobbies, Waiting Area, Hallways, Laboratories NC40 Standards. For large Lecture Halls, Auditoriums, Concert Halls, Recording Studios etc., (where more stringent controls are desirable) consult with the University Representative to set standards suitable for the intended uses. Design all other areas within the NC standards recommended in the latest edition of ASHRAE Applications Handbook.

E. General Noise Conditions

1. Minimize the number of penetrations due to all ducts and pipes through sound rated construction. Provide an airtight seal around the perimeter of all penetrations through rated construction using acoustical sealant. Avoid unnecessary penetrations into the conference rooms.
2. Lay out ductwork and diffusers to avoid crosstalk between rooms.

F. Air distribution design: (Deviations from these criteria shall be exercised as necessary for proper airbalance and acoustic control. Discuss any deviations with the University Representative.)

1. 425 cfm or more. Provide adjustable modular core diffusers or double deflection grilles to allow adjustment. Ceiling return and exhaust grilles shall be egg crate type. Diffusers, grilles and registers shall be selected and laid out so that air velocities at the occupied levels do not exceed 50 fpm. Perforated face diffusers are acceptable for supply diffusers required to be balanced at less than 425 cfm.
2. Low pressure ductwork shall be sized at no more than 0.08 inch/100 foot of duct and not exceeding 1500 fpm. The use of round ducts is encouraged if space allows it. All main distribution ductwork should be sized to accommodate the air handlers' peak cooling air flow including the 10% safety factor. Velocities up to 2000 fpm are allowed for straight ducts located in shafts.
3. Medium pressure ductwork shall be sized at no more than 0.2 inch/100 foot of duct, and not exceeding 2500 fpm. Medium pressure ductwork should be used only with approval from the University Representative.
4. Terminal boxes shall be provided for up to 900 square feet of open office space and 4 individual offices. Corner office should have independent boxes and control.
5. Provide bolted access doors at each elbow and at the base of each riser sized to allow proper cleaning. Install fire-rated access panel assemblies at each change in direction and at maximum intervals of 12 feet (3.7 m) in horizontal ducts, and at every floor for vertical ducts, and where indicated on drawings.

G. Hydronic Distribution

1. Pumps shall be selected for stable and efficient operation throughout the entire operating range not only the peak design operating point.
2. Size piping for a maximum friction loss of 4.0 feet per 100 feet of pipe with the velocities not to exceed 5 fps in occupied area, 7.5 fps for main and large branches inside buildings, and 10 fps outside buildings at maximum flows. Velocities in pipes that can lead to erosion in pipes will not be accepted.

H. Outdoor refrigeration equipment, air handlers, and HVAC units require a hose bib and 115-volt electrical receptacle be installed within 25 feet to allow cleaning, service and maintenance. Non - freeze hose bibbs are required for project sites located in freezing conditions.

I. For equipment maintenance, follow manufacturer's recommendations

and provide clearance forequipment replacement.

- J. For maintenance and access requirements, refer to Part II, Design Requirements, 'Access'.
- K. Metering.
 - 1. All new buildings shall be designed for metering of thermal utilities.
- L. Mechanical Equipment Rooms
 - 1. Equipment rooms with equipment other than those items directly related to air handling equipment will not be used for return air plenums. The use of rooms as plenums is permissible provided outside air and return air are directed to the plenum and volume control dampers are provided to control the quantity of each entering the plenum.
- M. Thermal Comfort
 - 1. Comply with latest edition of ASHRAE Standard 55, Thermal Comfort Conditions for Human Occupancy and provide a permanent monitoring system and process for corrective action to ensure building performance to the desired comfort criteria.
 - 2. The latest edition of ASHRAE Standard 55 Paragraph 7 Evaluation of the Thermal Environment provides guidance on measurement of building performance parameters and two methods for validating performance: (a) Survey Occupants and (b) Analyze Environment Variables. The permanent monitoring system required here may apply either approach; survey or technical system, where the process or system is integrated into the standard operating processes of the building.
- N. Ventilation
 - 1. Outside air shall be provided according with UMC and Title 24 Energy Code. In case a high ventilation rate is required use ASHRAE standard 62.1 "Ventilation for Acceptable Indoor Air Quality". The location of all air intakes shall be remote from any pollution sources and the building air intakes and exhaust shall be remotely located from each other to prevent contamination.
 - 2. For buildings falling under OSHPD jurisdiction, the ventilation rates shall be set as per UMC.
- O. Ventilation Monitoring
 - 1. Install permanent monitoring and alarm systems that provide feedback on ventilation system performance to ensure that ventilation systems maintain design minimum ventilation requirements in a form that affords operational adjustments:
 - a. For mechanical ventilation systems that predominantly serve densely occupied spaces (those with a design occupant density greater than or equal to 25 people per 1000 square feet), install a CO2 sensor within each densely occupied space.
 - b. For all other mechanical ventilation systems, provide an outdoor airflow measurement device capable of measuring the minimum outdoor airflow rate at all expected system operating conditions within 15 percent of the design minimum outdoor air rate. UC Davis Health has encountered maintenance difficulties with typical

air measurement devices. Consult and review proposed airflow measurement device with University Representative before specifying for a project.

- P. Requirements for Co2 Sensors when required by section above.
1. To ensure that sensors can reliably indicate that ventilation systems are operating as designed:
 - a. CO2 sensors shall be located within the breathing zone of the room as defined in the latest edition of ASHRAE Standard 62.1 and Title 24.
 - b. CO2 sensors shall be certified by the manufacturer to have an accuracy of no less than 75 ppm, factory calibrated or calibrated at start-up, and certified by the manufacturer to require calibration no more frequently than once every 5 years.
 - c. Required CO2 sensors and outdoor airflow monitors shall be configured to generate an alarm if the indicated outdoor airflow rate drops more than 15 percent below the minimum outdoor air rate required by Standard 62.1 in one of the following ways:
 - 1). A building automation system alarm visible to the system operator/engineer.
 - 2). An alarm that is clearly visible to or audible by occupants.
 2. CO2 sensors shall be used for demand-controlled ventilation provided the control strategy complies with latest edition of Standard 62.1 and Title 24 requirements, including maintaining the area-based component of the design ventilation rate.
 - a. Space CO2 alarms and demand-controlled ventilation set points shall be based on the differential corresponding to the ventilation rates prescribed in Standard 62.
 - b. When outdoor CO2 concentration is not measured, refer to Title 24 for assumed concentration.
- Q. Ventilation Criteria for Research Laboratories
1. Hazardous materials that are used or stored in Chemical, Biological, or Radiological Research and Teaching Laboratories require special ventilation.
 2. Room Ventilation
 - a. The laboratory ventilation rate is dependent on the hazards, heat, and/or odors to be controlled. At no time during occupied periods will the ventilation rate be less than 1 cfm/sf. The system shall be designed to reduce the ventilation rate during unoccupied periods by utilizing approved sensing technologies. Obtain approval from the University Representative for any reduced ventilation for the type of use and hazards.
 - b. Ventilation system for animal rooms shall comply with the Campus Design Guidelines and Standard Specifications.
 3. Room Pressurization and Containment
 - a. Laboratories and storage areas shall be maintained negative relative to non-laboratory or storage areas (hallways, offices,

- conference rooms, etc.); a room offset value of 10 percent of the maximum air value to the room is recommended.
 - b. Animal facilities containing noninfectious animals/agents and that are located within mixed -use buildings, shall maintain room air pressure differentials so that room pressure is negative to all adjacent areas.
 - c. Positively pressurized laboratories may be necessary under defined circumstances, such as cell culture.
 - d. Special containment (ventilated storage cabinets, special local exhaust, etc.) may be required for extremely noxious operations (muffle furnaces, etc.), extremely odiferous materials (mercaptans, sulfur compounds, etc.), carcinogenic, radioactive, or infectious animals/agents.
 - e. Toxic gases (arsine, phosphine, etc.) require ventilated cabinets with alarms.
4. Exhaust
- a. The fume hood exhaust discharge location shall be a minimum of 10 feet above the finished roof.
 - b. Special air cleaning devices may be required for some fume hood applications as required by the local jurisdiction. Consult the University Representative for any special requirements.
 - c. Fume hood ducts may be ganged onto exhaust plenum w/ multiple fans, with the exception of hot-acid, radioactive, etc.
 - d. Ductwork for hot-acid fume hoods shall be PVC lined.
- R. Telecommunication Rooms
- 1. Temperature range between 68 - 74-degrees F cooling; no heating; No Relative Humidity control unless directed by the University Representative. See UC Davis Health's Telecommunication Standard for more details.
 - 2. Provide air conditioned on a 24/7 basis for all technology rooms. A secondary source of cooling capable of handling the full cooling load shall be provided for redundancy as a base. However, verify with IT if redundancy is required per project basis. We encourage using the house air as a primary source of air conditioning through means of VAV/CAV boxes and use the secondary source as a back-up. To reduce energy, for buildings on schedule, the secondary source should become the lead air conditioning source during off hours used to avoid running the main air handlers just for this one room.
 - 3. Air circulation within the room shall be discussed with the University Representative during the design phase.
 - 4. Internal load: Per IT department is information available or otherwise Per National Telecommunication Standard.
 - 5. Chilled Water supply temperature: 44F
 - 6. Ductwork or piping not supporting equipment dedicated to the telecommunications room shall not be installed in, pass through, or enter the telecommunications room. Mechanical refrigeration equipment shall not be installed directly above telecom equipment.

Consideration of service clearance, access, and the potential of water damage from dripping or leaking equipment or piping shall be given.

7. All equipment rooms shall be environmentally controlled 24 hours a day seven days a week. If the building system cannot ensure continuous operation, a stand-alone unit shall be provided for the telecommunications space. If a standby power source is available in the building, consideration should be given to connecting the HVAC system serving the telecommunication equipment room to the standby supply.
 - a. HVAC shall be included in the design of the room to maintain a temperature between 68 - and 74-degrees Fahrenheit.

COMMON MOTOR REQUIREMENTS

23 05 13

A. Products

1. Combination magnetic starters shall have circuit breaker disconnects trip size of breaker as required for motor size, or equal.
2. Shaft grounding is required on all variable-frequency drive (VFD) assemblies with operating motors 5 horsepower and above. Provide shaft grounding systems manufactured by Aegis, SGS, or equal. Provide factory installed shaft grounding devices, either by motor or equipment manufacturer. VFD driven motors shall also be inverter-rated.
3. For field installed devices, consult the University Representative for approval. If field installed devices are provided, they shall be installed by a certified representative of the equipment, motor, or shaft grounding device manufacturer.
4. Motor bearings shall be guaranteed from electrical bearing fluting damage during the motor warranty period. Motor or bearing(s) shall be replaced at no additional cost to UC Davis Health.

B. Execution

1. Motors and VFDs furnished under Mechanical Work shall be installed under Electrical Work. Contractor to coordinate all motor starter and VFD requirements.
2. Shaft grounding device manufacturer's specific installation literature, specifications, and recommendations shall be followed.
3. Field installed shaft grounding systems shall be tested for proper conductive path to ground and shall pass manufacturer's published test procedure. Motor shall be grounded to the common earth ground with drive.
4. All motors 1 HP and over that are used at least 1,000 hours per year shall be premium efficiency. No shaded pole motors on fractional horsepower motors 1/20 HP and larger.
 - a. Consider ECM motor for fractional horsepower where applicable.

C. Shaft Grounding

1. Shaft grounding is required on all variable-frequency drive (VFD) assemblies with operating motors 5 horsepower and above. Provide

shaft grounding systems manufactured by Aegis, SGS, or equal. Provide factory installed shaft grounding devices, either by motor or equipment manufacturer

2. For field installed devices, consult the University Representative for approval. If field installed

devices are provided, they shall be installed by a certified representative of the equipment, motor, or shaft grounding device manufacturer.

3. Shaft grounding device manufacturer's specific installation literature, specifications, and recommendations shall be followed.
4. Shaft grounding systems shall be installed so that they are accessible for maintenance and inspection.
5. Field installed shaft grounding systems shall be tested for proper conductive path to ground and shall pass manufacturer's published test procedure. Motor shall be grounded to the common earth ground with drive.
6. If motor is subject to contaminants, debris or moisture, special shaft ground systems and/or seals shall be required. Follow manufacturer's applicable recommendations.
7. For motors operating at 100 horsepower or more: Follow shaft ground manufacturer's recommendations. Often it is required by the manufacturer that two shaft grounding devices be installed.
8. Motor bearings shall be guaranteed from electrical bearing fluting damage during the motor warranty period. Motor or bearing(s) shall be replaced at no additional cost to UC Davis Health.

METERS AND GAGES FOR HVAC PIPING

23 05 19

A. General

1. All new buildings shall be designed for metering of thermal utilities.

B. Products

1. Thermometers
 - a. Bimetal helix or liquid-filled type, Weston, Marshal Town, or equal. All thermometers shall be round, stainless steel case construction with glass front and shall be accurate within plus or minus one of the smallest scale divisions throughout the entire range.
 - b. Liquid thermometers for tanks and similar equipment shall have a minimum 5" diameter face. Thermometers for piping shall have a minimum face diameter of 5" and be liquid filled.
 - c. Thermometers used for air temperature in ductwork, plenum boxes, etc., shall have a minimum scale face of 5" and shall have an adjustable mounting flange.
2. Gauges shall be of high quality, with accuracy to be within 1% in the middle third of the dial range and equipped with front calibration.
3. Fluid Flow meters: Shall be magnetic full bore or insertion type. Manufacturer Onicon

or equal.

VIBRATION & SEISMIC CONTROLS FOR HVAC PIPING AND EQUIPMENT 23 05 48

- A. Isolate all ventilating equipment connections including conduit, piping drains, etc., so that equipment will operate under continuous demand without objectionable vibration.
- B. Support all fans on anti-vibration bases or hangers. Individual fans shall have integral fan and motor bases, spring type, unless otherwise noted.
- C. Selection of the bases or supporting units shall be in accordance with the vibration eliminator manufacturer's recommendations. Minimum static deflection shall be 1-1/2 inches or as marked on the Drawings.

HVAC PIPING INSULATION

23 07 19

- A. Products
 - 1. Pipe insulation materials
 - a. Calcium Silicate: Hydrous calcium silicate material recommended for temperatures up to 1200°F. Applied per manufacturers recommendations.
 - b. Fiberglass Insulation: Fiberglass Heavy Density 25, Johns-Manville Microlok, with ASJSSL jacket, or equal, with factory-applied, fire-retardant jacket and self-sealing laps, applied per manufacturers recommendations.
 - 2. Ductwork insulation
 - a. Manufacturers: Certain Teed Corporation, Johns-Manville Corporation, Owens-Corning Fiberglas Corporation, or equal.
 - b. All ductwork insulation to be exterior only. Wrap all supply and return ductwork and soundtraps, unless indicated or specified otherwise, with 1-1/2" thick, 1-pound density Fiberglass 100P, Johns-Manville, or equal
- B. Execution
 - 1. Piping system equipment, pumps, valves, unions, couplings and other components: Insulate with removable (replaceable) formed insulated covers.
 - a. Valves installed in insulated piping lines shall have valve handle extensions to clear the insulation. Affix label for valve location and directional flow
 - 2. Steam and Condensate piping
 - a. Insulate steam and condensate piping with calcium silicate or high temperature mineral fiber insulation per manufacturer's recommendation.
 - b. Minimum Insulation Thickness: 1). Piping 1" and smaller: 2". 2). Piping 1-1/4" to 2":

- 2".
 - 1). 3). Piping 2-½" to 4": 2-½".
 - 2). Piping 5" and larger: 3-½"
 - 3). Or per Title 24
- c. Cover all insulation that may be exposed to water, i.e., exterior piping, mechanical room, etc. with aluminum jacket.
- 3. Heating hot water and Chilled water piping: Insulate all heating hot water supply and return piping with 4 lb. nominal density fiberglass insulation.
 - a. Cover all piping insulation that may be exposed to water, i.e., exterior piping, mechanical room, etc. with 20 mil thick fire-retardant PVC jacket.
 - b. Heating hot water piping minimum insulation thickness: 1).
Piping 2" and smaller: 1-½". 1). Piping 2-½" and larger: 2"
 - c. Chilled water piping minimum insulation thickness: 1). Piping 1" and smaller: 1".
1). Piping 1-¼" and larger: 1-½".
- 4. Ductwork
 - a. For rectangular ducts exceeding 24" in width, provide mechanical fasteners on bottom of duct at maximum spacing of 18" c.c. Fasteners shall be weld pins or clinch pins: adhesive type pins shall not be used.
 - b. Cover all ductwork that may be exposed to water, including the mechanical room, with fiberglass, and protect with a sealant adhesive, Foster SEALFAS, Hardcast Flex-Grip, Childers Chil-Perm or equal.
- 5. Chilled water system equipment: Insulate equipment, including chilled water pump bodies, air separators, heat exchangers, tanks, etc.
 - a. Insulation shall be 3" thick, 3-lb. density fiberglass board.
- 6. Heating water system equipment: Insulate equipment, including pump bodies, air separators, heat exchangers, tanks, etc.
 - a. Cover the hot water equipment with 3" calcium silicate or high temperature mineral fiber blocks, securely wired on.
- C. Refrigerant Piping Insulation
 - 1. Consideration shall be given to type of refrigeration system to determine type of refrigerant pipe insulation. Industry standard practices shall apply.
 - 2. Industrial piping and long refrigerant lines: Use rigid molded fiberglass pipe insulation of appropriate wall thickness with white kraft paper reinforced with self-sealing longitudinal laps and butt strips. PVC jacket indoors, Aluminum dimple jacket outdoors. No PVC jacketing outdoors.
 - 3. Standard refrigeration systems walk in boxes, remote condensing units, split systems: Use Armaflex closed cell insulation or equal. Minimum 1/2-inch wall thickness for medium and high

temperature applications and minimum 3/4-inch wall thickness for low temperature applications.

4. Small split systems: Pre insulated "line sets" may be utilized.
5. All field or factory installed outdoor closed cell type insulation exposed to the weather shall be painted two coats with white UV protection paint.

COMMISSIONING OF HVAC 23 08 00

Refer to UC Davis Health's Standard Specifications, Section 23 08 00 for Commissioning of HVAC.

INSTRUMENTATION & CONTROL FOR HVAC 23 09 00

Refer to UC Davis Health's Standard Specifications, Division 25 for requirements. Due to the depth of the Controls and Instrumentation drawings, request the latest information from the University Representative.

INSTRUMENTATION AND CONTROL FOR LAB HVAC 23 09 10

A. General

1. Laboratory airflow control system shall be Siemens, Phoenix, Tek-Air, or equal, and shall meet the following criteria. Refer to Division 11 on Laboratory Equipment for additional related requirements.
2. Manufacturer shall have a minimum of 20 existing successful installations in full operation; five of which must be in California. Each installation shall have at least 20 laboratory controllers. The manufacturer must be in the business of providing laboratory variable airflow control systems for a minimum of ten years.
3. Contractor shall have a minimum five similar laboratory airflow control system installations that have been completed in the United States and have been in successful operation for at least one year. These installations shall employ components and materials similar to the components and materials submitted under these Contract Documents, shall be manifold exhaust/supply systems with multiple connections to fume hoods and laboratory supply and return grills from a manifold. Contractor shall have been in the business of installing laboratory airflow control systems for a minimum of five years. The Contractor shall provide a list describing the required number of installations and include the names, addresses, and the telephone numbers of the consulting engineer and the University Representative for each one.

B. Codes and Standards

1. The laboratory ventilation system shall meet requirements of all regulatory agencies including, but not limited to, the following reference documents. In the event of conflicting requirements, the general rule is to apply the more stringent requirement.
 - a. American National Standard for Laboratory Ventilation (ANSI/AIHA Z9.5).

- b. ANSI/ASHRAE 110, latest adopted edition.
 - c. ASHRAE, HVAC Applications Handbook, latest edition.
 - d. National Fire Protection Association, Standard NFPA 45 & NFPA 30, latest adopted edition.
 - e. US Dept. of Health & Human Services, Public Health Service, National Institutes of Health, NIH Publication No. 86-23.
 - f. Cal/OSHA, Title 8.
 - g. ASHRAE Standard 111, latest adopted edition and AMCA Standard 210 "Instrument Calibration."
- C. Fume Hoods
1. Commissioning of Fume Hood System: The laboratory fume hood system shall be 100 percent field-tested as installed in full accordance with ASHRAE 110 and shall meet 4.0A10.05 containment of tracer gas. In accordance with Cal/OSHA 5154.1, an average face velocity of at least 100 fpm shall be provided, with no point lower than 70 fpm. Higher than average face velocity may be required for special applications, consult the University Representative for those conditions. After installation, a qualified independent testing agency shall perform fume hood field tests on each hood. Test data shall be submitted to the University Representative for review by EH&S before installation is accepted. In addition, a separate face velocity test shall be coordinated with the University Representative and performed by the Facilities Department.
 2. Fume Hood Face Velocity: The control system shall maintain a face velocity between 100 fpm and 120 fpm with 110 fpm being the nominal average value when measured in accordance with Cal/OSHA 5154.1. Room air currents at the fume hood face shall not exceed 20 percent of the average face velocity to ensure fume hood containment. Zone Presence Sensors (equipment designed to reduce face velocity when workers are not present) are not permitted. The

minimum range over which the face velocity shall be controlled will be 10 percent to 100 percent of the design opening of the sash.
 3. Face Velocity Controller: The airflow at the fume hood shall vary in a linear manner between two adjustable minimum and maximum flow set points to maintain a constant face velocity throughout this range. When fume hood sash is totally closed, provide a minimum volume of 150 hood air changes per hour in conformance with ANSI Z9.5 and NFPA 45.
 4. Fume Hood Monitor: Fume hood monitor shall include an emergency maximum exhaust button as required NFPA 45.
 5. Response Time: VAV fume hood controller systems shall meet criteria to ensure the health and safety of the fume hood users. Using ASHRAE 110, latest edition, Paragraph 6.4 VAV Response Test, the face velocity shall be maintained between 80 and 120 fpm for the duration of the test. At no time during the sash movement and face velocity stabilization will the face velocity drop below 80 fpm or rise above 120 fpm. The face velocity shall stabilize at the values measured in the following paragraph within 10 seconds of the start of sash movement. The design opening

for the fume hood will comply with the UC Davis Health's Standard Specification, Division 11. Flow visualization tests in accordance with ASHRAE 110, Paragraph 6.1 shall also be performed, with no spillage of smoke. Negative room pressurization shall be maintained throughout testing.

6. Fume Hood Exhaust Airflow Control: The fume hood control shall establish an exhaust rate that will provide the desired average face velocity per design. The sash position or face velocity shall be continuously sensed to enable the control system to maintain the desired average face velocity.
 - a. Through the wall sensing using a hot wire anemometer located in the wall of the fume hood is unacceptable for controlling airflow in fume hoods. Refer to Division 11 on Laboratory Equipment.
 - b. Control panel locations shall be located on the drawings. Maintenance accessibility is critical.

D. Room Temperature Control

1. The control system shall include a control strategy to avoid excessive temperature swings when the room is subject to large, sudden changes in the ventilation airflow. The system shall be designed with separate heating and cooling set points, adjustable by a field technician. Zone temperature sensors shall be provided with a 2-hour temporary occupancy override capability. Occupancy hours, temperature set points, override hours of operation shall be adjustable at the Central Heating/Cooling Plant.

E. Reliability and Accuracy

1. System control methodology shall be based on full supply/exhaust volumetric airflow tracking capability. The system shall have a tight tracking control with supply valves tracking hood exhaust and general exhaust valves.
 - a. Air velocity instruments - Maximum allowable error in airflow measurements shall be less than 5 percent of flow over the operating range of the air valve.
 - b. Closed loop control - the closed loop control arrangement is required for laboratory VAV systems. In order to guarantee safety and compliance, laboratory airflow control systems that do not measure actual airflow shall provide independent airflow measuring stations for each air terminal device.
 - c. Through-the-wall pressure sensing between the laboratory and the corridor is not acceptable.

F. Air Terminal Devices

1. Momentary or extended losses of power shall not change or affect any of the control system's set points, calibration settings, or emergency status. After power returns, the system shall continue operation, exactly as before, without need for any manual intervention. Air terminal

devices shall fail in the open (fail safe) position.

2. Room shall be isolated to prevent positive pressure into the space.

3. During emergency conditions, exhaust fan shall allow for egress but shall continue to exhaust to capture fume hood gases.
 4. Supply fan speed shall be set during commissioning.
 5. Design air outlets and air terminal devices to ensure room noise and acoustic requirement does not exceed those specified in Division 11.
 6. Laboratory terminal devices shall have linear flow performance characteristics and provide minimum turndown ratio of 10:1 for fume hood exhaust terminals and adequate turndown for room supply and general exhaust terminals. A Venturi air valve, a bladder type air valve, or a blade damper type air control device is acceptable when coupled with the proper control system. Adequate turndown shall ensure that the airflows specified can be maintained. All air terminal devices shall be pressure independent over the specified differential static pressure operating range. Minimum airflow control accuracy shall be ± 5 percent of actual reading over the entire rated airflow range of each device. Overall room control performance shall be substantiated by a third-party test report. Minimum to maximum terminal airflow (or vice versa) shall be attained in less than 1 second.
 7. All supply air terminal devices shall be constructed of minimum 20-gauge galvanized steel. Damper shafts, where required, shall be solid 316 stainless steel with Teflon or Teflon infused aluminum bearings. Supply terminal air leakage shall not exceed 2 percent of design airflow at 4 inches w.g. positive static pressure.
 8. All exhaust air terminal devices shall be constructed of 316L stainless steel or 16-gauge aluminum. Damper shafts, where required, shall be solid 316 stainless steel with Teflon bearings. Aluminum fume hood exhaust terminal devices shall have a baked-on corrosion-resistant coating.
 9. A loss increase and/or decrease of airflow shall be transmitted to the fume hood or room controller as appropriate.
 10. Discharge and radiated sound power level data for all terminals shall be available and provided at the University Representative or Design Professional's request. The data shall be in accordance with the test procedure in ARI 880-89 Standard for Air Terminals and all data shall be obtained in a qualified, accredited and ARI approved testing laboratory.
 11. All terminal devices that require factory calibration shall be calibrated, in accordance with NIST, to the job specific airflows indicated on the Drawings.
- G. Instrumentation
1. Airflow measuring devices and sensors shall be of rugged construction. Electronic sensors exposed to exhaust airflow shall meet the UL913 Standard for Intrinsically Safe Apparatus and Associated Apparatus for Use in Class I, II, III, Division I, Hazardous Locations. Transducer accuracy shall be no less than ± 0.15 percent of span over the appropriate full-scale airflow range of the air terminal device. Materials shall be 316L stainless steel for all exhaust applications, and 304 stainless steel for supply air applications.
- H. Airflow Sensors

01 - General Requirements

1. Multi-point averaging type, 304 stainless steel for all supply air applications. Sensors shall be mounted on support bars as required to achieve an equal area traverse. Support bars over one foot in length shall be supported on both ends. Support bars shall be 304 stainless steel for supply air applications, and 316L stainless steel for exhaust applications.
- I. Control Air
 1. Provide dedicated minimum 30 psig clean, dry pneumatic supply air to all airflow control devices as required.
- J. Inter-Connectivity with EMS
 1. The laboratory airflow control system shall provide 0-10 volt or 4-20mA signal to signal components and controllers of a different DDC manufacturer. Full laboratory control system integration with the DDC system shall be done using BACNET protocol across the UC Davis Health campus's Ethernet. Conversion of system information to a BACNET protocol shall be the responsibility of the lab system provided.
 2. If host computer is used, the PC shall be a rack mounted industrial grade type P.C. installed in a clean ventilated and accessible location. P.C. cabinet shall be lockable and located where temperatures do not exceed 100°F.
 3. Coordinate for the actual points transferred. Design documents shall clearly identify the points that are required to interface with Energy Management system and ensure system is designed to accommodate the need. Points that require changeable set points at the EMS system include:
 - a. Zone schedule.
 - b. Zone occupied cooling set point.
 - c. Zone occupied heating set point.
 - d. Zone unoccupied cooling set point.
 - e. Zone unoccupied heating set point.
 - f. Reheat valve position (to exercise valves remotely).
 4. Monitoring only
 - a. Supply airflow.
 - b. General exhaust airflow.
 - c. Fume hood exhaust airflow.
 - d. Offset airflow set point.
 - e. Zone temperature.
 - f. Zone status (occupied, unoccupied, warm -up, heat, cool, deadband, override).
 - g. Reheat valve position.
 - h. Supply air terminal device position.
 - i. General exhaust air terminal device position.
 - j. Fume hood air terminal device position.

- k. Reheat coil leaving air temperature.
- 5. The EMS would then calculate and show on graphic screen the following
 - a. Air changes per hour.
 - b. Offset air flow, actual.
 - c. Alarm if ACH drops below 6 for x minutes (1 alarm per occurrence).
 - d. Alarm if offset air flow deviates from set point by x percent for y minutes (1 alarm per occurrence).
 - e. Energy trending and energy consumption reporting.
- K. Installation
 - 1. The manufacturer shall review the system for proper installation and shall warranty the system for parts and labor for five years after the system has been proved and accepted as complete by the University Representative. The manufacturer shall include two visits to the site after acceptance to confirm the system is operating as commissioned. The first visit shall be at the

end of year one and the second visit shall be at the end of year two.
 - 2. Calibration of fume hood controls, pressure transmitters, and air sensors shall be performed. A written report of each visit shall be provided to the University Representative, detailing what was done to each component. The design consultant shall include specific report requirements in specifications and shall discuss the project specific requirements with the University Representative. Calibration shall be performed in accordance with ASHRAE Standard 111 or latest edition and AMCA 210.

FACILITY FUEL OIL PIPING 23 11 13

Specification section to be developed by the consultant engineer with prior input from UC Davis Health.

FACILITY NATURAL GAS PIPING 23 11 23

Specification section to be developed by the consultant engineer with prior input from UC Davis Health.

HYDRONIC PIPING AND PUMPS 23 21 00

- A. System Design
 - 1. Differential pressure needs to be verified at point of connection. For buildings where the secondary loop cannot provide the necessary pressure to overcome the pressure drop across the new building piping system, a tertiary pump must be used to maintain adequate pressure. Coordinate with the existing tertiary pipe arrangement whether serial pumping or provide a blending loop. Unless otherwise directed by the University Representative, consider chilled water supply temperature 43F and hot water from the central plant 220F. Heat exchangers shall

- be provided for all floors above the 8th floor of a building.
2. Coordinate with the existing tertiary pipe arrangement whether serial pumping or provide a blending loop. Unless otherwise directed by the University Representative, consider chilledwater supply temperature 43F and hot water from the central plant 220F.
 3. Provide BTU meter on the CHW and HW supply on the loop.
 4. Provide full size by-pass with check valve around CHW pumps for first stage cooling.
 5. Provide two CHW pumps each sized for 50 percent max flow requirement. Pumps to haveVFDs.
 6. Provide two HHW pumps each sized for 50 percent max flow requirement. Pumps to haveVFDs.
 7. Shaft grounding is required on VFD driven pump motors. Refer to Section 150500 Common Motor Requirements.
 8. For hydronic systems where variable water volume (VWV) is used, provide the following:
 - a. Install modulating valves with minimum 100:1 turn down ratio and tight shut-off rated toclose against a differential pressure of 1-1/2 times pump head.
 - b. Locate differential pressure sensor at hydraulically most remote coil.
 - c. If hydraulically most remote coil is variable, provide multiple differential pressure sensorsand use a low signal selector to send proper signal to variable frequency drive.
 - d. Three-way valves should be avoided but where required: Limit total bypass gpm through 3- way valves to 1.5 gpm per pump horsepower by installing balance valve in the bypass of all3-way valves.
 9. In coil schedule, identify the control valve Cv value.
 10. 10. Identify control valve Cv.
 11. Provide reverse return piping or pipe looping where applicable.
- B. Piping, Joints and Fittings
1. Below grade/Under Schedule 40 steel, welded, flanged or with grooved fittings. Type L copper tubing 4 inches or smaller and type K copper tubing 5 inches and larger are also acceptable. Allbelow grade copper tubing shall be brazed with silver solder 1000 degrees F.
 2. Above ground: Black steel welded, flanged or with grooved fittings with flextronics gaskets. Type L copper tubing 4 inches or smaller and type K copper tubing 5 inches and larger are alsoacceptable. Copper tubing joints 1-1/4 inch and larger shall be brazed with silver solder 1000 degrees F.
 3. Grooved or flanged fittings and joints should not be used on 2-pipe change over systems.
 4. Mechanical grooved couplings allowed on chilled water systems in

accessible spaces only. Mechanical grooved couplings are not allowed on heating hot water systems.

C. Valves

1. Threaded or flanged, two-piece, bronze body, full port, ball valves, with stainless steel ball and stem, for isolation/shut off valves. Isolation valves shall be provided for all heating and cooling control valves, strainers, and coils that are separate from the valves used for water balance.
2. Balance valves shall not be substituted for isolation valves. Design criteria for isolation valves shall be based on best practices for optimal location to facilitate maintenance without compromising building operations and shall include the following minimums: one per each floor, one per each main branch, one at each terminal unit, and one on any branch serving more than five terminal units. If piping kits are provided at terminal units, separate isolation valves are required.

D. General

1. All fixtures and equipment branch lines to have shut-off valves at branch connection.
2. Shut off valves on heating and chilled water to be ball valves thru 2" and butterfly 2-1/2" and up.

E. Products

1. Butterfly Valves: Nibco, Norriseal or equal, equal to Demco Series NE. Provide lug body on valves located adjacent to equipment. All valves shall have EPT seats with aluminum bronze disc and throttling handle with memory stop. Furnish flow performance curve for each valve. Provide gear operators, handles for shut-off service, and infinite position throttling handles with indicator plates for balancing service. No wafer valves. All valves on heating water system shall be water 250°F or higher.
2. All building shut-off valves from Central Plant distribution system shall be Class 150 stainless steel flanged ball valves, Nibco or equal.

F. Execution

1. Locate valves so as to be accessible and so that separate support can be provided when necessary. All branches from vertical risers to have SOV'S.
2. Install valves with stems pointed up, in vertical position where possible, but in no case with stems pointed downward from horizontal plane.

STEAM AND CONDENSATE PIPING & PUMPS

23 22 00

A. System Design

1. Size steam pipe for flows between 8,000 and 10,000 FPM. If steam is run through building, engineer to calculate requirements for expansion loop and design support. Size PRVs for 1/3, 2/3 flow.

B. Piping, Joints and Fittings

01 - General Requirements

1. Underground/Pre-Insulated: See UC Davis Health's standard specification. Black carbon steel schedule 40 welded up to 10 inches by an AWS certified welder in accordance with ANSI B31.9. Refer to UC Davis Health's Standard Specifications, Division 33 for additional requirements.
 2. Above ground: Black carbon steel schedule 40 welded up to 10 inches by an AWS certified welder in accordance with ANSI B31.9. Schedule 80 for 2 inches and smaller for pressures above 50 psi. All high-pressure steam (above 50 psi) shall have fittings rated for a minimum of 300 psi.
 3. Steam Condensate Piping: Type K copper brazed. Brazing filler shall be 5 percent silver inside building and 15 percent silver when part of exterior building distribution system. For below grade piping, refer to UC Davis Health's Standard Specifications, Division 33 for additional requirements.
- C. Valves
1. All high-pressure steam (above 50 psi) shall have valves rated for a minimum of 300 psi.
- D. Pressure Reducing Valves and Regulators
1. Steam pressure shall be reduced from the high-pressure distribution system in two stages, the first being a reduction to 80 psi, and the second to 15 psi. Each stage shall have two pneumatically operated pressure regulating valves piped in parallel. The pneumatic air pressure for each PRV shall itself be set by an adjustable pneumatic pressure regulator. Pneumatic piping shall be in hard-drawn copper and have check valves upstream of the regulators to prevent steam from entering the pneumatic system in the case of a ruptured diaphragm at any of the reducing valves. Manufactured by Leslie Model GPS or equal (no known equal).
- E. Insulation
1. In Mechanical rooms and outside, insulate with calcium silicate, (fiberglass only on low pressure steam, designed for steam use). Cover with an aluminum jacket in exposed areas and if located 8-feet or lower. Provide PVC jacket in other locations. No jacket required on steam pipe where there is no chance of getting wet. Insulate steam condensate same as steam pipe.
- F. Accessories
1. High pressure steam trap shall be TLV Model J3S-X-10, stainless steel body with free floating ball and thermostatic air vent, or equal (no known equal); no by-pass, to match the existing distribution steam system. PRV shall be Leslie model GPS, air actuated, or equal (no known equal).
- G. Support
1. Pipe supports shall be on rollers and anchored at changes of direction. Install calcium silicate at supports.

REFRIGERANT PIPING

23 23 00

A. General

1. At all times during brazing and soldering a nitrogen purge is required.
2. ACR type L nitrogenized refrigeration grade copper pipe is required for all refrigerant piping. All copper-to-copper joints shall be made with 15 percent silfoss and all copper to brass connections will be made with 45 percent silver solder.
3. All 90-degree elbows will be long radius. Suction P traps and inverted P traps shall be manufactured as one piece and not field assembled.
4. All vibration eliminators shall be installed parallel to the compressor crankshaft.
5. Suction lines shall be sloped 1/2 inch per 10 feet toward the compressor. Low and medium temperature risers shall be trapped 10 feet on center. Trap high temperature vertical risers per manufacturer's installation literature.
6. All outdoor pipe insulation shall be painted with UV rated insulation paint or covered with a UV rated or aluminum insulation jacket.
7. All piping shall be labeled where entering or exiting equipment and in between, such as on a pipe rack or in a crawl space. Common refrigeration terminologies apply such as "Discharge Gas," "Suction Gas," "Hot Gas," "Liquid Line," etc. Industry standard "arrow" labels showing direction of flow shall accompany each pipe identification label.
8. All refrigerant pipe clamps shall be specifically designed for refrigeration piping and provide vibration and wear protection. Pipe clamping method shall be compatible with insulation type.

B. Testing of Refrigerant Piping

1. Refrigerant piping shall be pressure tested to a minimum of 175 psig. Test pressure shall not exceed the maximum rating of the weakest component of the system.
2. Each system upon completion of the pressure test shall be evacuated to a minimum of 500 microns. The system shall hold 500 microns for 20 minutes without deviation of more than 10 percent.

HVAC AIR DISTRIBUTION

23 30 00

A. Systems Design

1. Indicate on the drawings or specifications that low-pressure loss duct fittings shall be installed per Sheet Metal and Air Conditioning Contractors National Association (SMACNA) (see Section 2: Design for Energy Efficiency and SMACNA HVAC Systems Duct Design).
2. Specify appropriate SMACNA duct air leakage class (see SMACNA HVAC Air Duct Leakage Test Manual and SMACNA Technical Paper on Duct Leakage. Identify duct pressure classes on the ductwork plans, such as 1/2, 1, 2 etc., inside a triangle. Refer to SMACNA HVAC Duct

01 - General Requirements

Construction Standards, Figure 1-1. Require duct leakage testing for all ducts rated at three (3) inches of water and greater. Recommended maximum system leakage should be listed 5% of design air flow according with ASHRAE 2017 Fundamental Handbook chapter 21.

3. In buildings where code allows it, plenum return is acceptable.

B. Fans, Motors, and Drives

1. Fans shall be licensed to bear the AMCA ratings seal. Fans shall be tested for air and sound performance in accordance with the appropriate AMCA standard in an AMCA accredited laboratory.
2. The design horsepower rating of each drive shall be at least 1.5 times the nameplate rating of the motor. Proper allowances for sheave diameters, speed ratio, arcs of contact and belt length shall be followed in meeting the design horsepower of the drive.
3. All variable speed drives shall be selected to allow an increase or decrease of minimum of 10 percent of design fan speed.
4. Motor shaft grounding: See Division 23 05 13 Common Motor Requirements.
5. Motors over 15 HP: Adjustable sheaves shall be removed and replaced with fixed diameter sheaves prior to final air balancing.

C. Shafts and Bearings

1. Fan shaft shall be ground and polished solid steel with an anti-corrosive coating.
2. Bearing shall be selected for a minimum L-10 life in excess of 100,000 hours at maximum cataloged operating speed. Bearings shall be locked to the shaft concentrically without marring or burring the shaft.
3. All shaft bearings shall have extended lube lines with zerk fittings. Extended lube lines shall be UV resistant where exposed to the sun.

D. Sheaves

1. Sheaves shall be cast or fabricated, bored to size or bushed with fully split tapered bushings to fit properly on the shafts.

E. Ductwork

1. Use low pressure drop duct design. Use round duct wherever space permits. Only use flex duct to connect ducts to terminal diffusers, registers and grilles. Maximum length shall be seven (7) feet. The throat radius of all bends shall be 1-1/2 times the width of the duct wherever possible and in no case shall the throat radius be less than one width of the branch duct. Provide square elbows double thickness turning vanes where space does not permit the above radius and where square elbows are shown. The slopes of transitions shall be approximately one to five, and no abrupt changes or offsets of any kind in the duct system shall be permitted. Limit pressure drop to 0.08 inches H₂O per 100 feet. Insulation shall exceed latest CCR-Title 24, Part 6.
2. Provide drive slip or equivalent flat seams for ducts exposed in the conditioned space or where necessary due to space limitations. On ducts over 48 inches wide, provide standard reinforcing on inside of duct. Run-outs to grilles, registers or diffusers on exposed ductwork shall be the same size as the outer perimeter of the flange on the grille, register or diffuser. Provide, flexible connections on inlet and outlet of

each fan. Seal all seams around fan and coil housings airtight with appropriate sealing compound.

F. Dampers

1. Motor-operated, opposed blade type shall be galvanized iron with nylon bearings, interlocking edges to prevent leakage. Dampers shall have replaceable blade seals and stops for minimum air leakage. Blades shall be 16-gauge minimum, 10 inches maximum width with welded channel iron frame. Frame shall be sealed airtight to ductwork. Dampers with both dimensions less than 18 inches may have strap iron frames. Dampers exposed to the weather shall be weatherproof and made of corrosion proof materials.

G. Smoke Detectors in Ductwork

1. For additional information, refer to UC Davis Health's Standard Specification Section 28 31 00, Fire Detection and Alarm.
2. Layout ductwork and locate duct smoke detectors to ensure clearance is available upstream

and downstream of detectors pursuant to detector manufacturer's requirements. Duct detectors shall be compatible with the building's Fire Alarm System and shall be approved by the Fire Marshal of record. Duct detectors shall be accessible for testing and maintenance. Duct detectors should directly disable fan motors and send signals to building EMS to shutdown unit.

H. VAV And CV Boxes

1. The maximum air pressure drop (PD) of a bare box shall be 0.07 inches. For 1 row coil add 0.10 inches max. PD and for 2 row coils, add 0.15 inches to 0.20 inches PD. For VAV systems, unless calculations indicate otherwise, set minimum air flow for cooling and for heating to 40 percent of the maximum air flow value.

I. Grilles, Registers and Louvers

1. Provide all outlets with gaskets to minimize the streaking of the walls or ceilings due to leakage.

FUME HOODS

23 38 16

- A. Refer to UC Davis Health's Standard Specifications, Division 11 on Laboratory Equipment for information on fume hood construction. Refer to Section 23 09 10 for Laboratory Airflow Control Requirements.

B. Laboratory Hood Exhaust Fans

1. Fan type shall be carefully engineered and selected to meet or exceed its intended usage.
2. Fan assemblies shall be constructed with corrosion resistant materials engineered for the intended application.
3. Fan shall be licensed and bear the AMCA ratings seal. Fans shall be tested for air and sound performance in accordance with the

appropriate AMCA standard in an AMCA accredited laboratory.

4. Each fan shall be vibration tested as an assembly before shipping in accordance with AMCA204- 05.
5. Unit shall bear an engraved nameplate. Nameplate shall indicate design CFM, static pressure, and maximum fan RPM.
6. Unit fasteners exposed to corrosive airstream shall be of stainless-steel construction.
7. Provide fan curves for each fan at the specified operation point, with flow, static pressure, and horsepower clearly plotted.

C. Fans, Motors, and Drives

1. Motors shall be premium efficiency, standard NEMA frame, 1800 or 3600 RPM, TEFC with a 1.15 service factor.
2. Motor shaft grounding: See Division 23 05 13 Common Motor Requirements.
3. Motor maintenance shall be accomplished without fan impeller removal or requiring maintenance personnel to access the contaminated exhaust components. Belt drive configuration (if equipped) shall be AMCA arrangement 1, 9, or 10. High plume arrangement fans shall feature a bifurcated housing with the motor, belt drive (if equipped), and bearings located outside of the contaminated airstream. Direct drive arrangement 4, or direct drive arrangements requiring access and handling of hazardous and contaminated fan components for motor replacement are not acceptable.
4. Drive belts and sheaves shall be sized for 200 percent of the fan operating brake horsepower and shall be readily and easily accessible for service. Drive shall consist of a minimum of two belts under all circumstances.
5. Fan shaft bearings shall be Air Handling Quality, ball or roller pillow block type and be sized for an L-10 life of no less than 200,000 hours for high plume fans and critical applications, and L-10 100,000 hours for all others. Bearings shall be fixed to the fan shaft using concentric mounting locking collars, which reduce vibration, increase service life, and improve serviceability. Bearings that use set screws shall not be acceptable.
6. All shaft bearings shall have extended lube lines with zerk fittings. Extended lube lines shall be UV resistant.

MECHANICAL REFRIGERATION

23 60 00

A. Identification

1. Refrigerant and compressor oil type shall be clearly marked using nameplates on each unit.
2. The initial refrigerant charge shall be clearly listed using nameplates on each condensing unit.
3. A permanent nameplate shall be installed on both indoor and outdoor equipment stating the room number the equipment is serving (or

located within) and identify each piece of equipment clearly.

B. Electrical

1. All Semi Hermetic compressor motors less than 1 horsepower shall have single phase characteristics.
2. All motors over 1.5 horsepower shall have three phase characteristics.
3. Three phase equipment should incorporate a phase monitor.
4. Each refrigeration system shall be served by its own dedicated circuit breaker and disconnect means.

C. Refrigeration Temperature Control

1. Systems that can tolerate more than + or -2 degrees F deviation from set-point shall incorporate simplified control systems utilizing industry standard practices for control of refrigeration equipment.

D. Condensing Units

1. The refrigeration system shall be the standard product of a single manufacturer and shall be cataloged as systems, complete with system capacities. All components including controls and accessories shall be furnished by the system manufacturer and shall include a fully piped air-cooled condensing unit (as described below), evaporator (as described below), thermostatic expansion valve, liquid line drier, room thermostat, liquid line solenoid valve, suction line filter, etc.
2. Condensing units shall include motor-compressor, condenser, receiver, electrical control panel and all defrost components completely assembled on a steel rack, piped, wired, run-in and tested by the manufacturer. The motor compressors shall be semi hermetic with inherent 3-leg overload protection.
3. Air-cooled condensing units not located outside the building shall be located in a controlled temperature room. All systems with outdoor condensers or condensing units shall be provided with low ambient controls including a crankcase heater and a condenser fan control.
4. Condensing unit noise shall not exceed 78 decibels tested in accordance with ARI standards. Condensing units shall carry a 5-year compressor warranty.
5. All refrigeration pressure relief lines shall be piped to a location outside the building 20 or more feet from an intake opening, operable window, etc.
6. A refrigerant receiver will be required on all pump down systems.
7. All refrigeration systems shall be provided with a high- and low-pressure switch.
8. Thermal expansion valve systems are required on systems larger than $\frac{1}{2}$ horsepower. All thermal expansion valve systems will include a liquid moisture indicator. Expansion valve bulbs will be secured with brass straps and be insulated.
9. Liquid filter driers shall be included on all systems. Removable suction filter driers shall be utilized when needed to clean up large systems during initial break in period. Suction filter driers or cores shall be removed after minimum 48 hours of run time.
10. Low temperature refrigeration systems shall include a suction

accumulator and will operate as a pump down system.

11. A complete wiring and control diagram will be permanently affixed in a waterproof container to the inside of each compressor control panel.
12. Equipment charged in the field shall have a permanent label affixed to the condensing unit stating the refrigerant type, oil type, and operating refrigerant charge in pounds.
13. An oil failure control will be required on all semi-hermetic compressors with an oil pump.
14. Hot gas bypass valves will be installed with Schrader valve access and isolation ball valves.
15. All low temperature refrigeration designed to operate below 0 degrees C shall have electric defrost.
16. Hot gas defrost may be utilized on systems designed to operate above 0 degrees C.

E. Evaporators

1. Units shall have direct expansion cooling coils mounted in aluminum casing and be horizontally supported from the ceiling.
2. Coil shall have copper tubes hydraulically expanded into aluminum fins. Pitch coils in casing to provide drainage.
3. Evaporator drain will be provided with a trap outside of the refrigerated areas.
4. Drains will include a clean out tee and a pipe union and will not be reduced from the manufactured provided line size.
5. Freezer drains will include a drain line heater and rubber insulation.
6. Fan motors shall have built-in thermal over-load protection.
7. Systems having electric defrost shall include an evaporator fan thermostat and defrost termination control.

CUSTOM PACKAGED HVAC EQUIPMENT

23 75 00

- A. Draw through air handling units are required. Air handlers 10,000 cfm and larger including coil ends that are exposed to outside air conditions to have insulated casings to a minimum of R-8. If exposed to return air conditions R-4 is acceptable. Provide a variable frequency drive (VFD) for VAV systems.
- B. Systems with heating and cooling coils shall be configured with the heating coil receiving the incoming air before the cooling coil. For chilled water systems connected to the central plant, provide a minimum chilled water delta T of 20 degrees for all AHUs. Chilled water coils selection shall be based on 43F entering water temperature. For data center air handlers, the chilled water coil shall be selected for 44F water temperature.
- C. For heating hot water system, provide a system delta T of 40 degrees or higher. Preheat of heating coils shall be selected for 170F entering hot water temperature. Same temperatures should be used

for VAV/CAV boxes reheat coil selection.

- D. Maximum desired face velocity for constant and variable flow AHU coils is 450 FPM with the following maximum coil wet air pressure drop (inch water gage).

Air Face Velocity (FPM)	CHW & DX Coil Pressure Drop (inchwater gage)	Runaround Coil Pressure Drop (inchwater gage)	Heating Hot Water Coil Pressure Drop (inchwater gage)
450	0.55	0.50	0.16

- E. For air handlers 10,000 cfm and larger, provide low pressure drop, UL-approved air filters similar to the following:
1. Pre-Filters: Merv 8A high-capacity pleated panel with high strength beverage board Frames. Camfil Farr 30/30 or equal. Filters shall be 24 inches by 24 inches by 4 inches when possible.
 2. Final Filters: Merv 13 minimum, high efficiency, high capacity, 4V-bank rigid filter.
 3. Camfil Farr Durafil ES or equal. Filters shall be 24 inches by 24 inches by 12 inches when possible.
 4. Filter Housings shall be constructed to prevent air bypass. Filters and/or housings and access doors shall be gasketed.

Filter Efficiency	Desired Maximum Face Velocity (fpm)	Maximum Initial Pressure Drop (in. w.g.)
Merv 8 (40-50 percent)	400	0.17
Merv 11 (60-70 percent)	400	0.17
Merv 13 (80-90 percent)	400	0.19
Merv 15 (90-95 percent)	375	0.23
99.97 percent HEPA	250	0.65
99.99 percent HEPA	200	0.45

- F. Provide a local magnehelic filter gauge. Coordinate with Energy Management System and provide a magnehelic indicator/electronic transmitter (Dwyer model 605 or equal) to measure pressure differential across the filter.
- G. Indirect evaporative cooling systems shall be provided for all 100 percent outside air systems and shall be evaluated for systems using high outside air flow rates.

DECENTRALIZED UNITARY HVAC EQUIPMENT

23 81 00

- A. General
1. A control transformer shall be factory supplied and be an integral part of the equipment.

2. Gas fired heating equipment (when part of a package unit) shall be selected in lieu of heat
pump units whenever gas service is available.
3. Refrigeration circuits shall be factory leak tested, dehydrated and be fully charged with refrigerant.
4. Evaporator fans of less than 1/2 horsepower shall be direct drive multi-speed or variable speed motors with permanently lubricated bearings. Belt driven fans should be avoided when possible.
5. Condenser fans shall be direct drive propeller type with permanently lubricated bearings.
6. Filter Grilles shall be used in split systems with 2 or less return air grilles when air handlers are located above finished ceiling. Filter access through a finished ceiling should be avoided.
7. Low ambient controls: All mechanical cooling which is subject to winter operation such as server rooms, telecom rooms, and machine rooms shall be equipped with low ambient control option either factory or field installed. Low ambient control shall regulate speed of ball bearing type condenser fan motor in response to saturated condensing temperature or discharge pressure.
8. Equipment location.
 - a. All outdoor compressors require an oil sump heater.
 - b. A hose bib and a 120-volt dedicated circuit are required within 25 feet of outdoor equipment.
9. Under 15 H.P. - scroll compressors are preferred over reciprocating type compressors. Over 15 H.P. - Semi-Hermetic reciprocating or screw type compressors are preferred. Semi-Hermetic compressors shall be equipped with suction and discharge service valves and feature an oil sight glass.
10. 100 percent outdoor air: Units over 5 tons shall have two stages of mechanical cooling. Gas fired heating in this application shall have a modulating burner.
11. All refrigeration circuits shall be equipped with high- and low-pressure safety pressure switches.
12. On units with belt drive evaporator fans, an air proving differential pressure switch shall be provided and wired to disable the mechanical cooling upon loss of air flow.
13. All compressors shall be mounted on vibration isolators.
14. Wall Mounted Thermostats.
15. Refer to Standard Energy Management section.
 - a. Required Control Features:
 - b. Multistage programmable 7 day.

- c. Memory retention after loss of power.
 - d. No batteries required.
 - e. 2 stage heat and cool.
 - f. Automatic changeover.
 - g. Heat pump compatible.
 - h. Dual set point with adjustable dead band.
 - i. Large alphanumeric display backlit.
 - j. Easy programming.
 - k. Display either degrees F or C.
 - l. Locking keypad.
 - m. 5-minute short cycle protection.
 - n. Soft start compatible.
 - o. Remote sensor compatible.
16. Provide 18/8 conductor thermostat cable installed in a dedicated conduit.

COMPUTER SERVER ROOM AIR CONDITIONERS

23 81 23

- A. Dedicated Unitary special purpose computer server room air conditioners shall be used.
- B. Avoid belt driven fans and blowers on systems 5 tons or less.
- C. Equipment shall incorporate dry contacts for remote alarm monitoring.
- D. Server room application may require humidification, de-humidification and re-heat capability. Where required, ultrasonic or infrared type humidifier preferred. Canister-type steam generators should be avoided if using UC Davis Health's existing industrial cold water as the make-up source.

CONVECTION HEATING & COOLING UNITS

23 82 00

- A. Heaters over 100,000 BTUH shall be hard piped to their external shut off valve.
- B. Fan and blower motors shall be wired to allow cooling of the heat exchanger upon cycling on temperature.
- C. In alignment with UC Davis Health's Sustainability Policy, gas-fired equipment should be avoided unless approved by the University Representative.
- D. A drip leg shall be installed on gas supply piping at each appliance.
- E. Gas fired unit heaters installed indoors shall have forced draft combustion.
- F. Gas fired equipment installed in a dirty, dusty or otherwise contaminated location shall feature separated combustion.
- G. Gas fired equipment installed in a negative pressure environment shall feature separated combustion.
- H. Gas fired equipment heating 100 percent outside air or heating air at an

inlet air temperature below 40 degrees F shall feature stainless steel burners and heat exchangers.

- I. Boilers, steam generators and process heaters that trigger permitting shall have a non-resettable, totalizing gaseous fuel flow meter that measures the quantity (in cubic feet) of fuel combusted by the unit(s). Comply with California Health and Safety Code, Division 26 for local air quality permitting requirements.

BUILDING MECHANICAL ROOMS

23 90 00

- A. The final size and layout of the mechanical rooms is dependent on the final accepted mechanical system and required equipment. All mechanical rooms should be sized adequately to allow, not just code compliant clearances, but manufacturers required service clearances for maintenance staff. Review and coordinate the size, design and layout of the mechanical rooms with the University Representative.
- B. Outdoor refrigeration equipment, air handlers, and HVAC units require a hose bib and 115-volt electrical receptacle be installed within 25 feet to allow cleaning, service and maintenance.
- C. For equipment maintenance, follow manufacturer's recommendations and provide clearance for equipment replacement.
- D. Metering
 - 1. All new buildings shall be designed for metering of thermal utilities.
- E. Mechanical Equipment Rooms
 - 1. Equipment rooms with other equipment than those items directly related to air handling equipment will not be used for return air plenums. The use of rooms as plenums is permissible provided outside air and return air are directed to the plenum and volume control dampers are provided to control the quantity of each entering the plenum.
- F. The final size and layout of the mechanical rooms is dependent on the final accepted mechanical system and required equipment. All mechanical rooms should be sized adequately to allow, not just code compliant clearances, but manufacturers required service clearances for maintenance staff. Review and coordinate the size, design and layout of the mechanical rooms with the University Representative.
- G. Ductwork or piping not supporting equipment dedicated to the telecommunications room shall not be installed in, pass through, or enter the telecommunications room. Mechanical refrigeration equipment shall not be installed directly above telecom equipment. Consideration of service clearance, access, and the potential of water damage from dripping or leaking equipment or piping shall be given.

BUILDING AUTOMATION SYSTEM (BAS)

25 00 00

A. General Requirements

1. Provide all labor, supervision, technical and professional services, equipment, materials and supplies necessary for the design, installation and performance verification of a Building Automation System (BAS) including complete and seamless integration into UC Davis Health's Johnson Controls, JCI Metasys system.
2. The Building Automation System shall be an electronic, microprocessor-based automation and control system designed to monitor, control, manage energy use, process data, report and alert users on the operation and alarming of mechanical systems, and plumbing systems and electrical energy meters planned for this project.
3. The BAS shall monitor information provided by the lighting control system, and the BAS shall provide general scheduling capability of lighting systems.
4. Manufacturer: Johnson Controls, Inc. Metasys to match the existing infrastructure.
5. Installer: Johnson Controls, Inc. direct factory branch located in Folsom, CA
6. Controls companies submitting as an "approved equal" to JCI Metasys must be pre-approved prior to bid and gain owner's acceptance.
7. The entire BAS shall be
 - a. Approved and listed by Underwriters Laboratories, Inc. (UL).
 - b. Listed by State Fire Marshal as an approved smoke management system if smoke control is specified.
 - c. Approved by California Energy Commission as an approved Control and Energy Management System in compliance with California Energy Code Title 24 requirements.
 - d. ASHRAE Standard 135 BACnet for DDC control components.
 - e. The BAS manufacturer shall be ISO9001 certified for design and manufacture of environmental control systems for precise control and comfort, indoor air quality, HVAC plant operation, energy savings and preventive maintenance.
8. As a minimum, the Building Automation System shall consist of the following
 - a. Network Control Units, Operator Workstations and File Servers, connection to IP addresses.
 - b. Field Equipment DDC Controllers.
 - c. Interfaces and gateways to third party controllers.
 - d. Sensors, devices, valves and actuators, etc.
 - e. Cabling and cable termination at each device, testing of cable. Cable Jacket color and labeling to follow UC Davis Health's Division 27 guidelines. Cabling installation to follow California Electrical Code and TIA standards.
 - f. Programming or reprogramming of devices or equipment into the existing BAS. Demonstration of the new devices to the University Representative and IOR, by the JCI technician.

B. Direct Digital Control System, DDC, and User Interface

1. The Direct Digital Control (DDC) system shall be modular in nature permitting expansion of both capacity and functionality through the addition of sensors, actuators, network controllers, field controllers and operator devices.
2. Each DDC panel shall operate independently by performing its own specified control, alarm management, operator I/O, and historical data collection. The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices.
3. System Integration - BACnet
 - a. The existing network integrity shall not be impacted by the addition of new controllers.
 - b. All data required by the application shall be mapped into the Network controller database and shall be transparent to the operator. Point inputs and outputs from the third-party controllers shall have real time interoperability with the BAS software features.
 - c. Third party controllers shall communicate via BACnet MS/TP or IP. The manufacture of the equipment is responsible for providing and commissioning this gateway for use by the BAS system. The BMS contractor will only be responsible for integration gateways for third-party controllers with MODBUS.
4. System Architecture
 - a. First Tier or Level 1 Network - BACnet IP
 - b. Network Control Units, Operator Workstations and File Servers shall reside on the first-tier network.
 - c. The system architecture shall support expansion capacity of all types of DDC panels, and all point types included in the initial installation.
 - d. Second Tier or Level 2 Network; shall be BACnet MS/TP.
 - e. Dynamic Data Access: All operator devices, either network resident, shall have the ability to access all point status and application report data, or execute control functions for any and all other devices via the local area network. Access to data shall be based upon logical identification of building equipment.
5. User Interface
 - a. Mobile, Web Based, User Interface (MUI): The Mobile, Web Based, User Interface shall be HTML5-compliant and provide device-agnostic access to the system from smartphones, tablets, portable and desktop computers. User Interfaces that require software installation on the client device (ex. Java, Microsoft Silverlight®, Adobe® Flash®), or software downloads from an online app store shall not be acceptable for these purposes.
 - b. The MUI shall provide system operators with a simple location-based navigation approach to finding information, including the ability to search for any location by name and to bookmark a

location in a standard browser.

- c. Dashboard Displays: The user interface shall provide the ability to view equipment visualizations, floor plans, and/or other graphics on mobile or desktop client devices.
- d. Alarm Management
 - 1). The user interface shall provide a single configurable-display of all potential issues in a facility including items currently in alarm, warning, override, out-of-service and offline.
 - 2). The user interface shall provide the user with the understanding of what physical space is being affected when an alarm occurs. The user interface shall provide the ability to filter alarms by physical space affected when the alarm occurred.
- e. Equipment Activity Summary: The user interface shall provide a filterable, single display, of all activity related to a specific piece of equipment including user changes, discarded user changes, pending alarms, discarded alarms, and acknowledged alarms for at least one year of historical data.
- f. Equipment Relationships Summary: The user interface shall provide a summary of all
 - equipment and spaces related to the operation of the system or device currently selected for viewing.
- g. Equipment Data Summary: The user interface shall provide a summary of all data pertaining to a particular piece of mechanical or electrical equipment in a tabular format.
- h. Equipment Serving Space Summary: The user interface shall provide a summary of all mechanical and electrical equipment as defined in the points list that serves a selected space from the navigation tree.
- i. User Defined Summaries: Provide the capability to view, command, and modify large quantities of similar data in summaries without the use of a secondary application (e.g. a spreadsheet). These summaries shall be generated automatically, or user defined.
- j. Trends: The user interface shall provide the capability to view historical trend data from multiple pieces of equipment in both bar and line formats.
- k. Graphics
 - 5). The user interface shall display an equipment visualization or graphic within the context of its associated space (building, floor, room, etc.) or equipment dashboard.
 - 6). The ability of the graphics manager to create and edit graphics including the ability to bind graphic elements to the values and conditions of system points in both an on-line and off-line mode.
- l. As required, the BMS Contractor shall provide software licenses in the name of the Owner for programming, configuration and graphics building tools to allow designated UC Davis Health staff to make

changes, modifications or additions to the system. While future updates or revisions may require an update fee, UC Davis Health shall incur no additional cost if they choose not to update. Systems that require any annual or time-limited licensing fees shall not be permitted.

- m. Scheduling: The user interface shall provide the capability to display, in a singular view, all the effective schedules in the context of the space (building/floor/room, etc.) or equipment that the schedule affects. The software should have the ability to display an effective schedule, for the present, or a future date.
6. Site Management Portal and Associated Application Components
 - a. General - The Site Management Portal and its user interface shall serve as the primary tool for engineering personnel for the maintenance of the BAS
 - b. This version of the UI shall include - controller-based navigation trees, customizable user views, alarm management and prioritization, report generation, historical trending and scheduling.
- C. Electronic Sensors, Devices and Field Hardware
1. Provide field devices for input and output of digital (binary) and analog signals into DDC hardware. Provide signal conditioning for all field devices as recommended by field device manufacturers, and as required for proper operation in the system.
 2. Hydronic Flow Meters
 - a. Provide electromagnetic flow meters with an accuracy up to $\pm 0.15\%$ of volumetric flow rate accuracy over 13:1 flow turndowns, $\pm 0.25\%$ over 40:1 flow turndown.
 - b. The electromagnetic flow meter shall be Onicon or equal.
 3. Airflow measuring stations shall consist of an airflow measuring sensor(s) and matched transmitter
 4. Automatic Control valves and actuators shall be selected and sized based on the following requirements
 - a. Provide two-way PICV valves for all coils and terminal units.
 - b. Valve actuator and trim shall be furnished to provide close off pressure of 150% of total system (pump) head at the valve location.
 - c. Select control valves for branch design-flow and location on hydronic distribution network. Valves shall be selected, when at design flow, to provide pressure drop of at least 25% of the branch circuit from supply line to the return line. Valves nearer to pumps on direct return systems will be smaller than line size and provide more system dynamic pressure drop than valves far from the pumps. Obtain the distribution flow model from the University Representative to confirm system differential pressure available at the building.
 - d. Quality Assurance: Belimo shall manufacture valves and actuators unless a required valve is not available from Belimo. Danfoss or JCI

- valves are acceptable where Belimo does not have a valve for an application.
- e. Cooling and heating coil control shall be fully proportioning throttling type with modulating plugs or characterization discs for equal percentage flow characteristics.
 - f. Modulating valves (other than heating or cooling coil flow control control) shall be proportional "Globe" or ball type with linear characteristics.
 - g. Butterfly valves shall have a cast iron lug body, 304 stainless steel disk, 416 stainless steel shaft, EPDM O-ring, and RPTFE bushings.
 - h. Automatic Control Valve Actuators: Electric actuators shall consist of a high torque, reversible electric motor coupled through a permanently lubricated reduction gearbox directly to a valve stem coupling.
 - i. Pressure-independent controls valves shall be provided.
- D. Design Professional Coordination with the UC Davis Health and JCI
- 1. Design Professionals shall communicate with University Representative and PO&M staff during development of the controls design, including the sequence of operation for the HVAC systems.
- E. Project-Specific Requirements - to be developed for each project.
- 1. Design Professionals for design-bid-build projects and Design-Criteria professionals shall meet with the University Representative to develop and confirm project-specific BAS requirements, in addition the general BAS requirements listed above.
- F. Controls Materials
- 1. Setra pressure sensors
 - 2. VFD's: ABB
 - 3. GE PQM and EPM 7000 power meters
 - 4. GE/ABB Envisage System (Energy Monitoring Server)
 - 5. BacNet protocol
 - 6. Wattstopper (Legrand) - Lighting controls, window blinds and shades control. All these items need to be integrated in BMS.
 - 7. Relative Humidity and temperature transmitter-Veris
 - 8. Room pressure monitoring: TSI or Johnson Controls
 - 9. Building Automation - JCI
- Metasys10 . Water flow transmitters:
Onicon

COMMISSIONING OF INTEGRATED AUTOMATION

25 08 00

Contact the University Representative for the latest edition.

GENERAL PROVISIONS FOR BUILDING AUTOMATION SYSTEM

25 55 00

- A. Provide all labor, supervision, technical and professional services, equipment, materials and supplies necessary for the design, installation and performance verification of a Building Automation System, BAS, including complete and seamless integration into UC Davis Health's Johnson Controls, JCI, Metasys system.
- B. The Building Automation System shall be an electronic, microprocessor-based automation and control system designed to monitor, control, manage energy use, process data, report and alert users on the operation and alarming of mechanical systems, and plumbing systems and electrical energy meters planned for this project.
- C. The BAS shall monitor information provided by the lighting control system, and the BAS shall provide general scheduling capability of lighting systems.
- D. Manufacturer: Johnson Controls, Inc. Metasys to match UC Davis Health standard, to be provided by the University Representative.
- E. Installer: Johnson Controls, Inc. direct factory branch located in Folsom, CA.
- F. Controls companies submitting as an "approved equal" to JCI Metasys must be pre-approved prior to bid and gain owner's acceptance.
- G. The entire Building Automation System shall be
 - 1. Approved and listed by Underwriters Laboratories, Inc. (UL).
 - 2. Listed by State Fire Marshall as an approved smoke management system if smoke control is specified.
 - 3. Approved by California Energy Commission as an approved Control and Energy Management System in compliance with California Energy Code Title 24 requirements.
 - 4. ASHRAE Standard 135 BACnet for DDC control components.
 - 5. The BAS manufacturer shall be ISO9001 certified for design and manufacture of environmental control systems for precise control and comfort, indoor air quality, HVAC plant operation, energy savings and preventive maintenance.
- H. As a minimum, the Building Automation System shall consist of the following
 - 1. Network control units, operator workstations and file servers
 - 2. Field equipment DDC controllers.
 - 3. Interfaces and gateways to third-party controllers.
 - 4. Sensors, devices, valves and actuators, etc.

DIRECT DIGITAL CONTROL SYSTEM, DDC AND USER INTERFACE

25 55 20

- A. The Direct Digital Control (DDC) system shall be modular in nature

permitting expansion of both capacity and functionality through the addition of sensors, actuators, network controllers, field controllers and operator devices.

- B. Each DDC panel shall operate independently by performing its own specified control, alarm management, operator I/O, and historical data collection. The failure of any single component or network connection shall not interrupt the execution of control strategies at other operational devices
- C. System Integration: BACnet
 - 1. The existing network integrity shall not be impacted by the addition of new controllers.
 - 2. All data required by the application shall be mapped into the Network controller database and shall be transparent to the operator. Point inputs and outputs from the third-party controllers shall have real time interoperability with the BAS software features.
 - 3. Third-party controllers shall communicate via BACnet MS/TP or IP. The manufacture of the equipment is responsible for providing and commissioning this gateway for use by the BAS system. The BMS contractor will only be responsible for integration gateways for third-party controllers with MODBUS.
- D. System Architecture
 - 1. First Tier or Level 1 Network - BACnet IP.
 - 2. Network Control Units, Operator Workstations and File Servers shall reside on the first-tier network.
 - 3. The system architecture shall support expansion capacity of all types of DDC panels, and all point types included in the initial installation.
 - 4. Second Tier or Level 2 Network; shall be BACnet MS/TP.
 - 5. Dynamic Data Access: All operator devices, either network resident, shall have the ability to access all point status and application report data, or execute control functions for any and all other devices via the local area network. Access to data shall be based upon logical identification of building equipment.
- E. User Interface
 - 1. Mobile, Web Based, User Interface (MUI): The Mobile, Web Based, User Interface shall be HTML5-compliant and provide device-agnostic access to the system from smartphones, tablets, portable and desktop computers. User Interfaces that require software installation on the client device (ex. Java, Microsoft Silverlight®, Adobe® Flash®), or software downloads from an online app store shall not be acceptable for these purposes.
 - 2. The MUI shall provide system operators with a simple location-based navigation approach to finding information, including the ability to search for any location by name and to bookmark allocation in a standard browser.
 - 3. Dashboard Displays: The user interface shall provide the ability to view equipment visualizations, floor plans, and/or other graphics on mobile or desktop client devices.
 - 4. Alarm Management

- a. The user interface shall provide a single configurable-display of all potential issues in a facility including items currently in alarm, warning, override, out-of-service and offline.
 - c. The user interface shall provide the user with the understanding of what physical space is being affected when an alarm occurs. The user interface shall provide the ability to filter alarms by physical space affected when the alarm occurred.
5. Equipment Activity Summary: The user interface shall provide a filterable, single display, of all activity related to a specific piece of equipment including user changes, discarded user changes, pending alarms, discarded alarms, and acknowledged alarms for at least one year of historical data.
 6. Equipment Relationships Summary: The user interface shall provide a summary of all equipment and spaces related to the operation of the system or device currently selected for viewing.
 7. Equipment Data Summary: The user interface shall provide a summary of all data pertaining to a particular piece of mechanical or electrical equipment in a tabular format.
 8. Equipment Serving Space Summary: The user interface shall provide a summary of all mechanical and electrical equipment as defined in the points list that serves a selected space from the navigation tree.
 9. User Defined Summaries: Provide the capability to view, command, and modify large quantities of similar data in summaries without the use of a secondary application (e.g. a spreadsheet). These summaries shall be generated automatically, or user defined.
 10. Trends: The user interface shall provide the capability to view historical trend data from multiple pieces of equipment in both bar and line formats.
 11. Graphics
 - a. The user interface shall display an equipment visualization or graphic within the context of its associated space (building, floor, room, etc.) or equipment dashboard.
 - b. The ability of the graphics manager to create and edit graphics including the ability to bind graphic elements to the values and conditions of system points in both an on-line and off-line mode.
 12. As required, the BMS Contractor shall provide software licenses in the name of the Owner for programming, configuration, and graphics building tools to allow designated UC Davis Health staff to make changes, modifications or additions to the system. While future updates or revisions may require an update fee, the Owner shall incur no additional cost if they choose not to update. Systems that require any annual or time-limited licensing fees shall not be permitted.
 13. Scheduling: User interface shall provide the capability to display, in a singular view, all the effective schedules in the context of the space (building/floor/room, etc.) or equipment that the schedule affects. The software should have the ability to display an effective schedule, for the present, or a future date.

- F. Site Management Portal and Associated Application Components
 - 1. General - The Site Management Portal and its user interface shall serve as the primary tool for engineering personnel for the maintenance of the BAS
 - 2. This version of the UI shall include - controller-based navigation trees, customizable user views, alarm management and prioritization, report generation, historical trending, and scheduling.

ELECTRONIC SENSORS, DEVICES AND FIELD HARDWARE

25 55 30

- A. Provide field devices for input and output of digital (binary) and analog signals into DDC hardware. Provide signal conditioning for all field devices as recommended by field device manufacturers, and as required for proper operation in the system.
- B. Hydronic Flow Meters
 - 1. Provide electromagnetic flow meters with an accuracy up to $\pm 0.15\%$ of volumetric flow rate accuracy over 13:1 flow turndowns, $\pm 0.25\%$ over 40:1 flow turndown.
 - 2. The electromagnetic flow meter shall be Onicon or equal.
- C. Airflow Measuring Stations shall consist of an airflow measuring sensor(s) and matched transmitter.
- D. Automatic Control valves and actuators shall be selected and sized based on the following requirements
 - 1. Provide two-way valves for all coils and terminal units
 - 2. Valve actuator and trim shall be furnished to provide close off pressure of 150% of total system (pump) head at the valve location.
 - 3. Select control valves for branch design-flow and location on hydronic distribution network. Valves shall be selected, when at design flow, to provide pressure drop of at least 25% of the branch circuit from supply line to the return line. Valves nearer to pumps on direct return systems will be smaller than line size and provide more system dynamic pressure drop than valves far from the pumps. Obtain the distribution flow model from the University Representative to confirm system differential pressure available at the building.
 - 4. Quality Assurance: Belimo shall manufacture valves and actuators unless a required valve is not available from Belimo or JCI valves are acceptable where Belimo does not have a valve for an application
 - 5. Cooling and heating coil control shall be fully proportioning throttling type with modulating plug or characterization discs for equal percentage flow characteristics.
 - 6. Modulating valves (other than heating or cooling coil flow control) shall be proportional "Globe" or ball type with linear characteristics.
 - 7. Butterfly valves shall have a cast iron lug body, 304 stainless steel disk, 416 stainless steel shaft, EPDM O-ring, and RPTFE bushings.

8. Automatic Control Valve Actuators: Electric actuators shall consist of a high torque, reversible electric motor coupled through a permanently lubricated reduction gearbox directly to a valve stem coupling.
9. Pressure-independent controls valves shall only be used with review and acceptance by the Owner.

ELECTRICAL

26 00 00

A. General

1. Verify points of connection to existing UC Davis Health CUP utilities with the University Representative. New SMUD utility work shall be coordinated with SMUD and UC Davis Health. All utility service, including electric, telephone, fire alarm, data, etc. are to be underground.
2. Building electrical systems shall have utilization voltages of 480/277 volts, 3 phase, 4 wire and/or 208/120 volt, 3-phase, 4-wire, or as coordinated with the University Representative. New CUP supported projects shall have primary selective electrical services for normal power and emergency power from redundant CUP feeder circuit pairs (A and B feed respectively).
3. Convenience receptacles: Provide dedicated 20-amp, 120-volt circuits to feed duplex convenience receptacles (6 maximum per circuit). Spacing shall be no more than 50 feet in corridors with a maximum distance from any end wall of 25 feet.
4. Provide housekeeping pads for all floor mounted electrical equipment.
5. New electrical equipment shall have a minimum of 25% of spare capacity during design. All new boards shall have a minimum of 25% breaker pole space available for future breaker installations.
6. New electrical services shall be designed with a minimum of 25% spare capacity available for future.

B. Testing

1. Perform inspection and test procedures per International Electrical Testing Association (NETA) Standard latest edition.
2. OSHPD projects shall have all testing requirements included in their TIO documentation process by the project design professional.
3. Testing shall be performed by an independent third-party testing agency.
4. Testing shall be provided for all electrical systems, including the following:
 - a. All Medium voltage equipment, feeders, terminations, splices, service transformers, switches, and interrupters.
 - b. All Service and electrical equipment which also includes unit substations, switchboards, automatic transfer switches, distribution boards, and panelboards.
 - c. All electrical overcurrent devices which also includes

- breakers, switches, fuses, and disconnects.
 - d. All electrical wiring which also includes feeders, wiring, and branch circuits.
 - e. All electrical devices which includes receptacles, switches.
 - f. All lighting and lighting system components which includes interior light fixtures, exterior light fixtures, and all lighting controls.
5. The contractor shall develop an outline of all project specific equipment to be tested as part of their project scope. Include the proposed dates and timing for testing, the parties involved in the testing, information about the proposed tests to be included, the number of tests, how the testing report will be created, and all testing protocols shall be submitted to the University Representative for review and approval.

POWER SYSTEM STUDY

26 00 60

A. General

1. Provide a comprehensive power system study including separate sections for Short Circuit, Protective Device Evaluation & Protective Device Coordination Studies, harmonics evaluation, and Arc-flash and shock risk assessment. Submit studies to University Representative prior to receiving final acceptance of distribution equipment shop drawings or prior to release of equipment for manufacture. Include all new and/or modified equipment and breakers. Study shall include the complete normal and emergency systems as required. All analysis shall meet the current version of NFPA 70E.
2. Studies shall include all portions of electrical distribution system from the point of connection at 12,470V primary down to and including 480V and 208V distribution systems respectively. Include contributions from secondary power sources such as generators or the UC Davis Health CUP, all maximum fault condition shall be adequately covered in the study.
3. Evaluate a comprehensive harmonics evaluation as part of the power system study. This study shall demonstrate whether K rated transformers, feeders, and oversized neutral system components should be implemented.
4. The Arc Flash and shock risk assessment analysis shall include physical labels to be installed at all equipment outlining their hazard categories and required personal protective equipment (PPE).

SELECTIVE DEMOLISHION FOR ELECTRICAL

26 00 90

- A. Contractor shall coordinate all required power shutoff work and energizations with the University Representative prior to starting their work.
- B. Where remodeling interferes with circuits in areas that are otherwise undisturbed, circuits shall be reworked as required by the contractor.
- C. Contractor shall visit the Project site and verify existing device conditions and

shall remove, re locate and/or rework any electrical equipment or circuits affected (whether indicated or not) due to removal of existing walls, ceilings, etc.

MEDIUM VOLTAGE CABLE, TERMINATIONS, SPLICES, AND STRUCTURES 26 05 13**A. Medium voltage cable:**

1. Single conductors, Class B stranded, copper.
2. Insulation shall be Ethylene-propylene rubber (EPR), with 133% insulation level.
3. Jacket material type = Cross-linked polyolefin (XLPO), or polyvinyl chloride (PVC).
4. Metallic Shielding: Copper shielding tape, helically applied over semi-conducting insulation shield.
5. Cable Voltage Rating: 15 kV phase to phase.
6. Ground shield of shielded cable at terminations, splices, and separable insulated connectors. Ground metal bodies of terminators, splices, cable and separable insulated connector fittings, and hardware in accordance with manufacturer's written instructions.
7. In manholes, handholes, pull boxes, junction boxes and cable vaults, cables shall be fully looped around the walls for the longest route from entry to exit and support cables on galvanized steel racks at intervals adequate to prevent sag.
8. In each manhole and pull box install permanent tags on each circuit's cables and wires to clearly designate their circuit identification the tags shall be polyethylene with black stamped letters. Tags shall have a PVC holder and shall be attached to cable 6" below all terminations with two nylon cable ties. Tag shall identify cable phase, as well as circuit number and designation as indicated on the single line diagram. Tags in manholes shall be over fireproofing.

B. Splices and terminations

1. Splices and terminations shall be in accordance with IEEE 48, 386, 404 and 592.
2. Splices shall be made with standard kits and shall be one of the following types:
 - a. Premolded, cold shrink rubber, inline splice kit.
 - b. Premolded ethylene propylene diene monomer (EPDM) splice body kit with cable joint sealed by interference fit of mating parts and cable.
3. Conductor Terminations, General: Comply with Class 1 of IEEE Standard 48. Insulation class shall be equivalent to that of the cable upon which they are installed. Terminations for shielded cables shall include a shield-grounding strap. Termination kits shall be performance tested for compliance with IEEE Standard 48 and shall be of the following types: All terminations shall utilize separable type connectors.
 - a. Class 1 Termination for Shielded Cable: Modular type, furnished as a kit, with stress relief tube, multiple molded silicone rubber insulator modules, shield ground strap, compression-type connector, and end seal.
4. Ground shields of shielded cable at terminations and splices. Ground

metal bodies of terminators, splices, and hardware in accordance with manufacturer's written instructions.

C. Medium voltage structures

1. Manholes

- a. Size manholes to accommodate all feeders, wiring, switching, and extensions for future.
- b. Manholes shall be reinforced concrete, precast and designed for H20-44 wheel loading. Provide knockouts for future duct connections.
- c. Electrical manholes shall be nominal 10'x12' with inside clear height shall be nominal 8 feet-0inches. Locate depressions in manholes for future sumps at an unused corner.

2. Pull boxes

- a. Minimum size of pullboxes shall be 4 feet by 6 feet, and 3 feet deep. Boxes shall be reinforced concrete type with traffic rated lids.
- b. Stamp boxes with Electrical on the top of the cover.

LOW VOLTAGE ELECTRICAL POWER CONDUCTORS & CABLES

26 05 19

A. Conductors and Cables:

1. Conductor size shall be a minimum of No. 12 AWG. The minimum size of emergency systems conductors shall be No. 10 AWG.
2. All power and low voltage conductors shall be copper, stranded type wire, 90C, THHN/THWN or XHHW unless otherwise required by the California Electrical Code. Do not use solid type wire.
3. Insulation voltage level rating shall be 600 volts minimum.
4. Conductors sized #6 and smaller shall be solid color wire of the appropriate phase color, wire #4 and larger may be black and phased tape at all boxes and terminations.
5. 60C ampacities shall be used for sizing of all wire and cable for branch circuits and feeders at 100amps. 75C ampacities shall be used for sizing of all wire and cables for feeders greater than 100 amps.
6. Use 10 AWG conductors for 20 Ampere, 120 volt branch circuit home runs longer than 75 feet, and for 20 Ampere, 277 volt branch circuit home runs longer than 200 feet. Increase circuit conductor sizes for ambient temperature corrections, current carrying conductor adjustments in accordance with CEC article 310, and all voltage drop provisions including California Title 24 (T24). Include completed forms signed by the design professional, contractor or commissioning agent, as applicable.
7. Cables shall be jacketed 600 volt SO type. Cable connectors shall be steel case liquid tight sized for cable diameter and shall use strain relief gland fitting to prevent tension on conductor terminals.

B. Splice, Taps, and Connectors

1. Splices, taps and connectors (No. 10 AWG and smaller) - Splices and joints shall be twisted together electrically and mechanically strong and insulated with approved type insulated electrical spring connectors.
2. Splices, taps and connectors (No. 8 and larger) - Joints and connections shall be tool applied pressure lugs and connectors. Uninsulated lugs and wire ends shall be insulated with layers of plastic tape. Polaris type connectors may be used with prior review and approval from PO&M electrical department.
3. Full size ground wires shall be installed. Do not use raceways for the sole grounding or bonding of a branch circuit. Secure using approved methods at each box with approved bonding fittings. .
4. A maximum of three branch circuits are to be installed in any one conduit, on 3 phase 4 wire system. This includes homeruns, no more than three branch circuits shall be installed.
5. Make splices in conductors only within junction boxes, wiring troughs and other enclosures as permitted by the California Electrical Code. Do not splice in panels, or boards
6. Do not splice conductors in pull boxes, panelboards, safety switches, switchboard, switchgear, motor control center, or motor control enclosures.
7. Splices in conductors installed below grades are not permitted, unless approved in writing by the University Representative.
8. Outdoors and below grade use wire connectors or compression type with heat shrink style watertight splice covers. Use Scotchcast 3570G resin epoxy to waterproof connections.

C. General

1. Control, communications or signal conductors shall be installed in separate raceway systems from electrical line voltage wiring. Color coding of the low voltage wires used for these systems are specified under the respective sections for these systems.
2. Install a minimum of twelve inches (300 mm) of slack conductor at each outlet.
3. Provide wire markers on all current carrying, and neutral conductors at each board source of origin and junction boxes. Megger and record insulation resistance of all 600 volt insulated conductors in the project scope and all new feeders on the single line diagram, using a 1,000 volt megger. Make tests with circuits isolated from source and load.
4. Provide flexible connections of short length to installations or equipment subject to vibration or movement and to all motors. Provide a separate bonding conductor across all flexible connections.
5. Wire Color Code - Color code all conductors. Wire sizes #6 AWG or smaller shall have integral color coded insulation. Wire sizes #4 AWG and larger may have black insulation but identified by color coded electrical tape at all junction, splice, pull, or termination points. Color tape shall be applied 1/2 lap to at least 6 inches of conductor. Color Code wires as follows:

Conductors	120/208 Volts	277/480 Volts
Phase A	Black	Brown
Phase B	Red	Violet
Phase C	Blue	Yellow
Neutral	White	White or Gray
Ground	Green	Green

GROUNDING & BONDING FOR ELECTRICAL SYSTEMS

26 05 26

A. General

1. Ground rods shall be copper encased steel, 3/4" diameter, 10' length, minimum.
2. All conduit bushings shall be grounding type.
3. Ground conductors shall be UL approved and code sized copper, with dual rated THHN/THWN insulation, color identified green.
4. Grounding conductors shall be connected to ground rods or connected to structural steel using exothermic welds or high-pressure compression type connectors.
5. New systems shall include concrete-encased electrodes consisting of bare copper conductors placed in the bottom of the structural footings. The grounding system shall include all fittings, connectors, devices, and material necessary for a complete and useable system. Bond the grounding system to building columns in new construction. Grounding system shall obtain a ground resistance of the grounding grid of not to exceed 5 ohms.
6. Install ground rods inside of Precast concrete box nominal 9" throat diameter x 14" deep with light duty concrete cover for non-traffic areas or steel plate for traffic areas. Cover shall be embossed or engraved with "GROUND ROD".
7. Power system grounding
 - a. Buildings shall have a main building ground bus mounted on the wall in the main electrical room. Connect the following items using CEC sized copper grounding conductors to lugs on the main building ground bus:
 - 1). Grounding conductor from building reference ground bus in main service switchboard.
 - 2). Bonding conductor to Telecom grounding system.
 - 3). Bonding conductor to metallic cold water piping system.
 - 4). Bonding conductor to additional ground rods.
 - 5). Bonding conductor to building structural steel.
 - b. Separately derived system grounding conductors in same room.
 - At the building power system reference ground bus in the main service switchboard, connect the grounding electrode conductor

from concrete encased UFER ground or alternate grounding electrodes.

8. Separately derived electrical system grounding
 - a. Transformers: Provide a dual rated four or six-barrel grounding lug with a 5/8"-11 threaded hole. Drill enclosure with 1 1/16" bit and attach lug to enclosure utilizing a torque bolt and a dragon tooth transition washer or equal. Connect the following when present:
9. Equipment bonding/grounding
 - a. Provide a CEC sized insulated copper ground conductor in all 120VAC through 600 VAC feeder and branch circuit distribution conduits and cables.

HANGERS & SUPPORTS FOR ELECTRICAL SYSTEMS

26 05 29

A. Conduit supports

1. Conduit clamps, straps, and supports shall be steel or malleable iron for all exposed individual conduit runs. Clip type hangers may be used in concealed areas on individual conduit runs. Group mounted, exposed or concealed shall be supported by trapeze hangers constructed of formed steel channels and threaded rods.

B. Vibration Isolation

1. Provide vibration isolation and all supporting hardware for vibrating electrical equipment, (e.g., transformers). Isolators shall be as recommended by manufacturer to maximize their effect. Isolators shall be as manufactured by Mason Industries, or equal.

- C. Conduit Supports Single point beam clamps not allowed. Conduits shall not be attached to ceiling support wires. For individual conduit runs not directly fastened to the structure, use rod hangers. For multiple conduit runs, use trapeze type structural channel conduit support. In new construction, conduits installed inside of walls must have approved clamp supports. No twisted wire allowed.

- D. Steel channels, bolts, washers, etc., used for mounting or support of electrical equipment shall be galvanized type. Where installed in corrosive environment stainless steel hardware shall be used.

PULL BOXES AND JUNCTION BOXES

26 05 32

A. Pull, Splice and Junction Boxes

1. Indoor, general purpose boxes shall be a NEMA 1 enclosure, constructed of code gauge galvanized steel. The boxes shall be constructed from a single piece of steel with folded and welded corners. Boxes shall have hinged covers or flat removable, galvanized sheet metal covers held in place with binder head sheet metal screws.
2. Outdoor boxes surface mounted above ground in wet locations shall be

- cast iron with a plain castiron cover. Covers shall be neoprene gasketed and shall be NEMA 4 watertight construction. The cover shall be held in place by stainless steel screws.
3. Underground boxes - Underground boxes over 24-inches square shall be sized to provide floor space for workers to stand in the box without the need to stand on conductors in the box.
 4. For recessed boxes, use an outside flanged recessed cover. For outdoor boxes mounted on exterior surfaces, use an unflanged box with weather seals.
 5. Conduit openings shall be bossed, drilled and tapped in outdoor boxes.
 6. Standard size metal boxes stamped from galvanized steel shall be used for indoor above ground general purpose.
 7. Above ground outdoor boxes shall be cast iron with threaded hubs for vap or tight and wet locations where indicated.
 8. Underground boxes 24-inches square or larger shall be high density reinforced concrete with end and side knock-outs. All such boxes shall be back filled around the outside with concrete. Each shall be equipped with the following reinforced concrete accessories:
 - a. Extensions as required
 - b. Box floor
 - c. Lid with hold down bolts and labeled with usage. (Steel checker plate with hold down bolts in traffic areas.)
 9. Provide pull boxes or junction boxes in conduit runs over 90' long or when more than 4 quarter bends occur in a conduit run.
 10. Install all boxes such that covers are accessible.
 11. Cut or sheared edges shall be filed or honed, eliminating all sharp edges.
 12. Boxes shall be installed with unused or open knockouts plugged.
 13. Install boxes direct buried in earth or concrete flush with surface, square with surrounding structures.
 14. All above ground boxes shall be labeled on the cover indicating circuit number and panel number.

CONDUIT, FITTINGS, AND RACEWAYS

26 05 33

A. General

1. The minimum size of interior conduit shall be $\frac{3}{4}$ ".
2. Conduits shall only be filled to 30% maximum fill.
3. Type MC cable shall not be used on the UC Davis Health campus.
4. Bushings shall be metallic insulated type. Weatherproof or dust-tight installations shall be liquid-tight with sealing ring and insulated throat. Bushing shall be OZ/Gedney type KR, or equal (Or equal, no known equal.)
5. Expansion and deflection fittings shall be OZ/Gedney, type DX, or equal

01 - General Requirements

6. All under floor/ground raceways will be cleaned and mandrilled before wire is installed
7. Electrical Metallic Tubing (EMT) couplings and connectors shall be steel compression "concretetight" type. All connectors shall be nylon insulated throat type. Fittings shall meet same requirements for finish and material as EMT conduit. Box connectors shall be equipped with insulated throat
8. Fittings for rigid steel and IMC shall be standard threaded couplings, locknuts, bushings and elbows. Fittings shall be assembled with anti-corrosion, conductive anti-seize compound at joints made absolutely tight to exclude water. Set screw or non-thread fittings are not permitted.
9. Malleable iron, die cast, or pressure cast fittings are not permitted. All fittings shall be steel.
10. All connectors and bushings shall be steel with insulated throat.
11. Non-metallic conduit when installed on the site shall have a minimum size 1.0".
12. Non-metallic conduit shall be heavy wall, Schedule 40 PVC or Schedule 80 PVC.
13. Non-metallic conduit fittings shall be of the same material as the conduit furnished and be the product of the same manufacturer. PVC 90-degree bend elbows shall not be used. Wrapped rigid will be used in its place. Double lap of Calpico 10 mil or approved equal.
14. Flexible conduit and fittings shall be liquid tight with watertight connectors when installed in damp or wet locations.
15. Flexible conduit and fittings shall be steel insulated throat type rated as suitable for system ground continuity. Connectors for liquid tight flexible conduit shall be screw-in ground cone type.
16. Flexible conduit shall not be less than ¾" trade size and in no case shall flexible conduit size be less than permitted by the CEC for the number and size of conductors to be installed herein.
17. No aluminum flexible conduit shall be used.
18. Wireway systems shall utilize steel bases and covers.
19. Wireway systems shall have dividers between line voltage and low voltage systems.
20. Surface metal raceways - Wiremold, or equal (Series 2000, 3000, 4000, & 6000). Wireway systems smaller than Wiremold series 700, or equal are not permitted.
21. Provide completely separate raceways for the life safety, critical, equipment, and normal branch power systems in accordance with the CEC.
22. Galvanized rigid conduit shall be used in damp or wet locations including outdoor service yards and roofs, in concrete walls or block walls, in concrete vaults, when exposed in locations below 8', where subject to physical damage, and in mechanical rooms.
23. Conceal all conduits, unless approval for surface mount is obtained from the University Representative. Conduits may be exposed in non-public spaces such as electrical rooms, mechanical rooms, and penthouse or basement utility rooms.
24. Install galvanized pull line, or nylon pull rope in all spare conduits.

25. Uses permitted

- a. Galvanized rigid conduit or IMC shall be used as follows:
 - 1). For primary and secondary service (except when installed below the ground floor slab and above the building mat slab) and for secondary unit substations, switchboard, motor control center, dry-type transformer and panelboard feeders.
 - 2). Buried in or in contact with earth to be half-lapped with omic pipe wrapping tape with sealant applied to all joints.
 - 3). In poured concrete walls, floor and roof construction, provided a minimum of 2" of cover is maintained.
 - 4). In all walls up to the first outlet box where fed from rigid conduit in damp locations or locations exposed to the weather.
 - 5). In exposed locations below 8 feet above the floor, including all mechanical rooms.
 - 6). All elbows for underground plastic conduit.
 - 7). All conduits for interior wiring systems whose voltage is above 600 volts.
 - 8). All conduits entering refrigerated spaces.
 - 9). For emergency power feeders and circuits when installed outside of building.
- b. Electrical metallic tubing (EMT) shall be used as follows:
 - 1). Concealed in stud partitions and hollow masonry walls.
 - 2). For connections from junction box to lighting fixtures except in accessible ceilings.
 - 3). In suspended or accessible ceilings above 8 feet.
 - 4). Exposed in dry locations above 8 feet where not subjected to mechanical damage.
 - 5). In furred ceiling spaces.
- c. Rigid non-metallic conduit shall be used as follows:
 - 1). For the branch circuit wiring for exterior lighting pole bases and bollards (horizontal runs only).
 - 2). All elbows, both vertical and horizontal, shall be GRC, not PVC.
 - 3). Any non-metallic PVC conduit used for emergency power systems shall be schedule 80 PVC.
 - 4). The communications conduit shall be schedule 40 PVC.
- d. Flexible steel conduit shall be used as follows:
 - 1). Recessed lighting fixtures. (last 6ft to the fixture, max)
 - 2). Motor connections.
 - 3). Connection between fan plenum and structure.
 - 4). At expansion joints.

- 5). At transformers and other equipment which produces vibration.
- 6). At damp and wet locations or where exposed to weather, flexible steel conduit shall be liquid tight type.
- 7). Tite-bite type connectors shall be used.
- 8). All flexible steel conduit shall be used with code sized ground wire installed.
- 9). All homeruns shall be in conduit, do not use flexible conduits for any homeruns routed to panels.
- e. All other conduits shall be electrical metallic tubing (EMT) unless otherwise noted.
- f. Direct Burial Conduit
 - 1). Unless otherwise indicated install top of conduits 24" minimum below finished grade.
Utility primary conduit shall be 48" below finished grade.
 - 2). Medium voltage conduits installed on the UC Davis Health campus site shall be 5.0" schedule 80 PVC, or GRC when routed inside buildings.
 - 3). All medium voltage conduits not under building slabs or parking lots shall be encased in a minimum of 3" concrete. Concrete for primary conduit shall contain a red pigment dye to make it readily noticeable. Provide 10% red oxide per cubic yard of material.
 - 4). Pitch the trench uniformly towards manholes or both ways from high points between manholes for the required duct line drainage. Avoid pitching the ducts toward building wherever possible.
 - 5). Install top of conduits approximately 6" minimum below bottom of building slabs.
 - 6). Install top of conduits 30" minimum below grade, below roads and any other paved surfaces.
 - 7). Place a 4" wide, bright yellow, non-biodegradable plastic tape 12" above all underground conduit outside of building foundations.
 - 8). Where transition is made from below grade PVC installation to a metallic conduit system above grade or slab, and at transition at manholes and service switchgear, make transition with rigid galvanized elbows and extend through slab or above grade with galvanized rigid steel conduit. For corrosion protection, where the elbow penetrates surface, wrap with vinyl all-weather electrical tape for 6" above and below concrete surface.
 - 9). For all underground runs of two or more conduits, separators or spacing blocks made of plastic or other suitable nonmetallic, nondecaying material shall be placed on not greater than four foot on center. They shall be of the interlocking type both horizontally and vertically. Ducts shall be anchored to prevent movement during placement of concrete.
 - 10). Before installing the last 8" of lift of backfill for all primary feeders and for secondary service feeders, install plastic

identification tape warning of buried electrical lines the full length of duct bank trench.

- g. Raceway Installations Within Concrete
 - 1). Conduits shall not be installed within shear walls unless specifically coordinated with the structural engineer. Conduits shall not be run directly below and parallel with load bearing walls.
 - 2). Conduit stub-up penetrations through slabs shall be installed with the top of a threaded conduit coupling flush with the finished slab.
 - 3). Protect all conduits entering and leaving concrete floor slabs from physical damage during construction.

IDENTIFICATION FOR ELECTRICAL SYSTEMS

26 05 53

A. General

1. Provide engraved plastic-laminate sign on each electrical device or piece of electrical equipment in the building, or project including:
 - a. Electrical cabinets, panels, boards, disconnects, switches, control panels, devices, and enclosures.
 - b. Access panel/doors to electrical facilities.
 - c. Transformers and UPS equipment
 - d. Automatic transfer switches and generator equipment.
2. Each individually mounted circuit breaker, and each breaker in the switchboards, secondary unit substations, and distribution panels shall have a sign.
3. Signs shall have 1/2" high text lettering on 1-1/2" high sign (with 2" high used for signs with multiline text).
4. Signs shall be color coded for the systems they serve as follows
 - a. 480/277 volt normal power equipment shall be identified with white faceplate with green core.
 - b. 480/277 volt critical branch power equipment shall be identified with white faceplate with yellow core.
 - c. 480/277 volt life safety branch (or emergency branch at non hospital buildings) power equipment shall be identified with white faceplate with red core.
 - d. 480/277 volt equipment branch power equipment shall be identified with white faceplate with blue core.
 - e. 208/120 volt normal power equipment shall be identified with green faceplate with white core.
 - f. 208/120 volt critical branch power equipment shall be identified with yellow faceplate with white core.
 - g. 208/120 volt life safety branch (or emergency branch at non hospital buildings) power equipment shall be identified with

red faceplate with white core.

- h. 208/120 volt equipment branch power equipment shall be identified with blue faceplate with white core.

5. Equipment identification is to indicate the following

- a. Equipment ID or name abbreviation.
- b. Voltage, phase, and wires.
- c. Power source description or system.
- d. Power source origination.
- e. Example: Panel SLGHA1; 480/277V, 3 Ø, 4 W;

Life Safety System; Fed by EM1

- 6. Submit complete schedule with the shop drawings listing all nameplates and information contained thereon.
- 7. All electrical devices and switches shall have engraved device covers, 1/8" high letters. Include panel name and circuit number. Critical, life safety, and equipment branch devices shall have nameplates engraved in red. Normal branch devices shall have nameplates engraved in black.
- 8. All conductors shall be marked and identified. Include voltage, phase and feeder number, on each cable/conductor in each box/enclosure/cabinet where wires of more than one circuit or communication/signal system are present.
- 9. Provide brass tags, 2" diameter 19 gauge, die stamped and punched for fasteners. Tags shall be used to identify each individual conductor landed at ground buses. For example, "UFER", "Building steel", "Cold water bond", etc.
- 10. Box Identification
 - a. After box installation and wire termination completion provide color coded junction box covers for all above ceiling junction boxes. Covers shall be painted with a masked stripe down the middle for hand inscription with black indelible marker. Color schemes shall conform to:
 - 1). Normal power- Green background, black marker with circuiting information contained.
 - 2). Equipment power- Blue background, black marker with circuiting information contained.
 - 3). Critical power- Yellow background, black marker with circuiting information contained.
 - 4). Life Safety power- Red background, black marker with circuiting information contained.
 - 5). Fire alarm system - Red junction boxes, red raceways, red background, black marker with circuiting information contained.
 - b. Using an indelible wide tip marker, indicate on the cover of each junction and pull box the designation of the circuits contained therein, i.e., L1A-1, 3, 5. .
 - c. All junction and pull boxes for wiring systems above 600V shall be

identified with high voltage warning labels installed every 20 linear feet in accordance with OSHA standards. All boxes shall also be painted red.

11. Fasteners for equipment or device tag identification shall be self-tapping stainless steel screws, except contact-type permanent adhesive where screws cannot be used, or should not penetrate the substrate material of the equipment.
12. Provide updated, type written, panelboard schedules for all branch circuit work completed as part of renovation and/or new construction projects. Schedules shall include the load description and the room number or area the load is installed.

POWER MONITORING AND CONTROL SYSTEMS

26 09 13

A. General

1. New electrical services, main switchboards, and significant renovation project shall have new metering on the main boards. These meters shall interface with the existing GE power monitoring and control system (PMCS).
 - a. System requirements
 - 1). Monitor the load measured by electronic power meters installed on each of the mainbreakers in new 15kV switchgear and secondary mains of new unit substations.
 - 2). Monitor the load measured by the trip devices on all feeder circuit breakers in all secondary unit substations. Monitor trip status
 - 3). Configure Demand Reports for new electronic power meters on unit substation or service mains.
 - 4). Provide a seamless integration with the existing UC Davis Health campus BMSE equipment shall be General Electric (EPM6000), or equal.
 - 5). Where new metering is added to existing facilities, the existing facility overview screen shall be updated to include the new monitoring equipment.
 - d. Where new buildings are added the existing central plant lineup screen shall be updated to reflect changes made as part of the individual project. New electrical distribution boards, and panelboards installed in new buildings, and significant renovation projects shall all have new board level metering.
 - 1). Provide new meters at each panelboard, or main section of multi-section panelboards.
 - 2). Provide new meters at each distribution board.
 - 3). Metering system shall aggregate the load at each board and include all functions necessary to support OSHPD meter trends for load validation.
 - 4). The metering system shall be consistent across the UC

Davis Health campus, manufactured by Square D or ABB as coordinated with the PO&M electrical department.

- 5). The meters shall all be networked to a single head end interface allowing for remote access via the internet. Include all parts and pieces necessary for PO&M to log into the system from their remote computers at their office space.
- 6). The system shall locally store a minimum of 1 year of data on each meter installed.
- 7). The meter shall not rely on a separate 120v cord and plug for its power connection. Integrate the new meter installations with the new board installations.
- 8). Meters may be furnished integral to boards, or in separate adjacent enclosures.

LIGHTING CONTROL DEVICES

26 09 23

A. General

1. Provide complete lighting control system consisting of relay panels, switching and dimming room controllers, addressable drivers, switching/dimming control stations, scene controls, emergency lighting transfer devices, daylighting photocells, occupancy sensors, remote input/output modules, raceways and wiring with network control interface.
 - a. Coordinate integration with Division 25 BAS when required.
 - b. All lighting control stations serving fixtures on the emergency, life safety, or critical branch shall be red in color.
 - c. All controls shall be compliant with the California Energy code - Title 24 requirements.
2. The lighting control system shall utilize distributed lighting controls, hybrid, or a centralized system approach and be capable of wireless, wired, or hybrid wireless/wired architectures. System shall be capable of networked, or standalone operation.
3. The lighting control system shall be programmable and the status readable using a USB connection to the UC Davis Health's computer operating system running the supplier's software package. Systems which require the computer to stay on-line and connected 24/7 are not acceptable.
4. One set of any interconnecting cables, adapters and/or software program required to operate, troubleshoot, program, display the status of or interface with the system shall be supplied. Software and cable or adapter costs shall be included.
5. The lighting control system manufacturing company shall be regularly engaged in the manufacture of lighting control equipment and ancillary equipment for not less than 5 years.
6. The lighting control system must have remote access ability for the factory to access the system and help troubleshoot, program, or alter the system without being on-site. This factory service must be available 24

hours a day, 365 days a year.

7. The lighting control system shall have the capability of integrating into Building Automation System (BAS) or Energy Management System (EMS) with the key feature being the ability to, but not limited to monitoring the lighting zones.
8. The building interior lighting control system shall be Acuity nLight, or WattStopper Digital Lighting Management (DLM).
9. Lobby and Common Areas: Occupancy sensors will turn the lights on and off from the high trim to the low trim setpoints. If it applies, the area shall have dimming zones controlled by daylight sensors. Minimum lighting levels shall be maintained at the path of egress. Local control stations will provide override switching during off-times. Include these spaces on networked lighting controls system.

SECONDARY UNIT SUBSTATIONS

26 11 16

A. General

1. Provide secondary unit substations for indoor/outdoor single-ended or double-ended configurations.
2. Construction: Provide totally enclosed, metal-clad secondary unit substation constructed of bolted or welded sheet steel, front operable free-standing, adequately braced for rated interrupting capacity without distortion or damage. Make provisions for future additions. Design housing for floor mounting, complete with channels and necessary hardware.
3. Housings: Ventilate housing to provide "natural chimney effect".
4. Bus: Provide ground bus extending entire length of unit substation.
5. Equipment Assembly: Assemble, wire, and test substations at factory. Equipment components shall be the responsibility of one manufacturer.
6. The transformer unit supply shall consist of an HV flange and an LV flange. Connections between the primary device and transformer shall be cable, and between the transformer and secondary shall be flexible braided bus.

B. Primary section

1. Switch Types
 - a. For Emergency Branch Unit Substation: Provide primary section consisting of 3-pole air interrupter fused switches. Size fuses to properly protect transformer. Include one extra set of primary fuses. Switch arrangement shall be for a primary selective system. Provide lugs to permit primary cables to be looped into and out of switch so that more than one switch can be connected to a primary circuit.
 - b. For Normal Branch Unit Substation: Provide primary section consisting of 3-pole air interrupter fused switches. Size fuses to properly protect transformer. Include one extra set of primary fuses. Switch arrangement shall be for a primary selective system. Provide lugs to permit primary cables to be looped into and out of switch so that more than one switch can be connected to a primary circuit.

- c. General
- d. The primary switches shall consist of deadfront, completely metal enclosed free standing structure(s) containing interrupter switches and fuses (when appropriate) of the number, rating, and type noted on the drawings or specified herein. All switches shall meet or exceed all applicable NEMA, ANSI, and IEEE Standards.
- e. The load interrupter switches shall be quick-make, quick-break three pole, gang operated, with stored energy operation. Each switch shall have the following minimum ratings:
 - 1). System Voltage 12.47 kV
three phase three wire
 - 2). Maximum Design Voltage 15 kV
 - 3). Basic Impulse Level 95 kV
 - 4). Amperes Continuous 600 Amps
 - 5). Amperes Interrupting 30,000 Amps
 - 6). Momentary (Switch Closed, 10 Cycle)
30,000 Amps. Asym.
 - 7). Fault Close
40,000 Amps. Asym.
- f. A manual over toggle type mechanism shall be supplied which utilizes a heavy duty coil spring to provide opening and closing action of the switch. The speed of opening and closing the switch shall be independent of the operator, and it shall be impossible to tease the switch into any intermediate position.
- g. The interrupter switch shall have separate main and make/break contacts to provide maximum endurance for fault close and load interrupting duty. The switch assembly shall have insulating barriers between phases and between outer phases and the enclosure.
- h. The switch assembly shall be integrally designed and produced by the manufacturer of the interrupter switches, fuses, and enclosures to assure a completely coordinated design and establish one source of responsibility for the equipment's performance.

C. Construction

- 1. The following features shall be supplied on every three pole, two position open-closed switch:
 - a. A high impact viewing window that permits full view of the position of all three switch blades through the closed door.
 - b. For fused units, a fuse access door interlocked with the switch so that:
 - The switch must be opened before access to the fuses is possible.
 - The door must be closed before the switch can be closed.
 - c. A grounded metal barrier in front of every switch to prevent inadvertent contact with any live part, yet still allow for a full-view inspection on the switch blade position.

- d. Provision for padlocking the switch in the open or closed position.
 - e. Permanent "Open-Closed" switch position indicators.
 2. Fault protection shall be furnished by fuses where indicated on the contract drawings. Fuses shall have a minimum interrupting rating of 30,000 Amperes symmetrical at 15 kV and shall be expulsion type. Furnish three spare refills for each fused switch and provide a storage rack on the inside of the main door for these spare fuses.
 3. One two-hole NEMA pad per phase shall be provided for attaching field installed cable termination suitable for copper cable of the number and sizes indicated on the drawings. Sufficient vertical space shall be supplied for field installed electrical stress relief termination system.
 4. All bus shall be tin plated aluminum and be mounted on NEMA rated glass polyester insulators. All bussing shall be braced for the maximum available fault current.
 5. Enclosure construction shall be of the universal frame type using dieformed, welded, and bolted members. All enclosing covers and doors shall be fabricated from not less than 11-gauge steel. To facilitate installation and maintenance of cables and bus, the top and rear covers shall be removable.
 6. Each switch cubicle shall have a single, full length, flanged front door or two hinged front doors over the switch and fuse assembly where applicable and shall be equipped with padlockable means.
 7. All enclosing and supporting steel shall be thoroughly cleaned and phosphatized to assure proper surface for prime and finish coats.
 8. Small wiring, fuse blocks and terminal blocks within the switch shall be furnished as required. All groups of control wires shall be labeled with wire markers and all wires leaving the switch shall be provided with terminal blocks having suitable numbering strips.
 9. A nameplate shall be mounted on the front door of the switch cubicle.
 10. Supply Kirk key interlocks between pairs of switches at each unit substation to prevent switch operation unless the associated low voltage main device is open.
 11. 15 kV station class surge arrestors shall be provided per Section 46424 26 14 23 and connected at the incoming terminations and securely grounded to the metal structure for these secondary unit substation.
- D. Transformer section (DRY)
1. The transformer shall be of explosion resistant, fire-resistant, air insulated, dry type construction, cooled by the natural circulation of air through the winding.
 2. The ratings of the each transformer shall be as follows:
 - a. KVA Rating: 750 KVA at 80°C/997.5 kVA at 150°C AA/FA or 1500 KVA at 80°C/2000 KVA at 150°C AA/FA or KVA size as required to support the specific load of the subject project scope.

01 - General Requirements

- b. Impedance: 5.75%
- c. HV: 12.47 kV Delta
- d. HV BIL: 95 kV
- e. HV Taps: ± 2 to 2- $\frac{1}{2}$ % full capacity
- f. LV: 480Y/277 volts Delta

3. Units shall be forced air (FA) units and shall contain all necessary components and wiring for automatically increasing the KVA rating to 133%. They shall include a temperature indicator and control device. Contacts for alarm as well as for starting and stopping fans shall be included. Control power for fans shall be obtained from a control transformer within the secondary

switchboard or other external source as shown on the drawing s. Provide hand-off-auto switch for fan control.

4. The electrical insulation system shall utilize Class H material in a fully rated 220°C system. Transformer design temperature rise shall be based on a 30°C average ambient over a 24 -hour period with a maximum of 40°C. Solid insulation in the transformer shall consist of inorganic materials such as porcelain, glass fiber, electrical grade glass polyester or Nomex. All insulating materials must be rated for continuous 220°C duty. The insulation between the high and low voltage coils shall be more than sufficient for the voltage stress without the need of a varnish.
5. The low voltage winding shall be pressure wound on a rectangular mandrel. Multiple strands of aluminum conductor shall be used for each turn. Turn-to-turn insulation shall consist of a combination of inorganic paper, high temperature fiber winding insulation and high temperature phenolic varnish. A flexible mica plate shall be wrapped over the cooling duct spacers of the low voltage winding to insulate it from the high voltage winding. The high voltage winding shall then be tension wound indirectly over the mica barrier to form a single rigid unit. Special inorganic paper and high temperature molded glass fiber spacers shall provide the layer-to-layer insulation within the high voltage winding.
6. The completed winding assembly shall be completely dried in special ovens, vacuum impregnated with silicone varnish, and fully cured to provide a 150°C rise (220°C hot-spot) insulation system.
7. The resin shall be polyester having high resistance to moisture. The transformer shall be designed for a temperature rise of 80°C and shall be capable of operating at 35% above base nameplate KVA capacity continuously without any loss of life.
8. The transformer shall be supplied in a knockdown case design, for ease in fitting through limited openings, and shall be of 13 gage sheet minimum steel construction, equipped with removable panels for access to the core and coils. Front and rear panels shall incorporate ventilating grills.
9. Transformer shall include: Diagram instruction plate, provisions for lifting and jacking, removable case panel for access to high voltage strap type

connector taps for de-energized tap changing, drip proof cover, two ground pads with continuous copper ground bus.

E. SECONDARY SECTION

1. General

- a. Provide key interlocks for main breaker and high voltage switch to prevent opening of switch without first opening main breaker.
- b. Provide secondary section with required number of bolted sheet steel enclosures for proper installation of circuit-breakers and ancillary equipment indicated.
- c. Fasten vertical sections together to form complete, and rigid structure. Provide hot-dip galvanized bolts, nut, and lock washers for fastening purposes.
- d. Provide studs, buswork, and complete provisions for installing future circuit-breakers; also include provisions for mounting current transformers and meters.
- e. AC Dead-Front Distribution Switchboards: Provide factory-assembled, dead-front, metal-enclosed, self-supporting secondary power switchboards, of types, sizes, electrical ratings and characteristics indicated; consisting of vertical panel units, and containing circuit-breakers of quantities, ratings, and types indicated. Provide copper main bus and connections to circuit-breaker branches of sufficient capacity to limit rated continuous current operating temperature rise of no greater than 65°C above average ambient temperature of 40°C; with main bus and tap connections silver-surfaced and bolted tightly according to manufacturer's torquing requirements for maximum conductivity. Brace bus for short-circuit stresses up to maximum interrupting capacity. Provide accessibility of line and load terminations from front of switchboard. Provide mimic bus on front of each switchboard. Equip units with built-in lifting eyes and yokes; and provide vertical individual panel units, suitable for bolting together at project site. Switchboards shall be type General Electrical Powerbreak II, or equal, no known equal. Construct switchboard units for the following environment:
 - f. Installation: Indoors, NEMA Type 1.
 - g. Provide accessory and instrumentation small wiring, necessary fuse blocks and terminal blocks within the switchboard. All groups of control wires leaving the switchboard shall be provided with terminal blocks with suitable numbering strips.

2. Bussing

- a. All bus bars shall be copper with bolted connections at joints. The bus bars shall be of sufficient size to limit the temperature rise to 65°C rise based on UL tests, and rated to withstand mechanical forces exerted during short circuit conditions when directly connected to a power source having an available fault current of 65000 amperes symmetrical at rated voltages. Provide full capacity neutral.
- b. A ground bus rated a minimum of 25% of main bus ampacity shall be furnished firmly secured to each vertical section structure and shall extend the entire length of the unit substation. An incoming ground

lug shall be furnished. Other ground lugs shall also be supplied for feeder circuits as shown in the schedules on the drawings.

- c. All hardware used on conductors shall be high-tensile strength and plated. All terminals shall be of the anti-turn solderless type suitable for CU or A1 cable of sizes indicated for 75°C.

3. Construction

- a. The vertical sections shall align front and rear with depth as shown on the drawings. Mains and feeder devices shall be individually mounted with line and load bus connections. Devices shall be front removable and load connections front accessible.
- b. Main and tie devices shall be individually mounted and arranged for drawout construction. Feeder devices shall be group mounted. All circuit breaker devices shall be individually removable from the front of the switchboard.

4. Metering

- a. Provide a separate customer metering compartment with front hinged door and include the following:
- b. Manufacturer's standard electronic metering package including ammeter, voltmeter, power factor, KWH demand meter, instantaneous KVA, and peak demand readings for the system.
Provide auxiliary dry contacts to allow metering data to be transmitted to a remote central monitoring station. Provide all required current and potential transformers.

F. Overcurrent Devices - General

- a. Main and tie protective devices in all secondary unit substations shall be drawout mounted power circuit breaker with interrupting rating, frame, and trip ratings as coordinated.
- b. Feeder protective devices shall be individually mounted, insulated case breaker type with frame and trip rating as shown on the drawings and have additional characteristics as specified.
- c. Provide interface for each circuit breaker for the project equipment monitoring system. All ground fault currents, circuit breaker trips, and reason for breaker opening (i.e., ground fault, overload, etc.) shall be reported to and recorded by the project equipment monitoring system. Coordinate between the breakers and the equipment monitoring system to insure compatibility.

- G. Breakers shall be manually operated (MO) unless electrically operated (EO) is required. Electrically operated breakers shall be complete with control switch plus red and green indicating lights to indicate breaker position.

PAD MOUNTED, LIQUID-FILLED MEDIUM-VOLTAGE TRANSFORMERS 26 12 19

A. General

1. Windings Material: Aluminum.
2. Surge Arresters: Comply with IEEE C62.11, Distribution Classes: metal-oxide-varistor type, fully shielded, separable-elbow type, suitable for plugging into the inserts provided in the high-voltage section of the transformer. Connected in each phase of incoming circuit and ahead of any disconnecting device.
3. Winding Connections: The connection of windings and terminal markings shall comply with IEEE C57.12.70.
4. Efficiency: Comply with 10 CFR 431, Subpart K
5. Insulation: Transformer rating shall be the average winding temperature rise above a 30 deg C ambient temperature shall not exceed 65 deg C and 80 deg C hottest-spot temperature rise at rated KVA when tested according to IEEE C57.12.90, using combination of connections and taps that give the highest average winding temperature rise.
6. Tap changer: External handle, for de-energized operation.
7. Tank: Sealed, with welded on cover. Designed to withstand internal pressure of not less than 70psi (50 kPa) without permanent distortion and 15 psig (104 kPa) without rupture. Comply with IEEE C57.12.36.
8. Enclosure Integrity: Comply with IEEE C57.12.28 for pad-mounted enclosures that contain energized electrical equipment in excess of 600 V that may be exposed to the public.
9. Mounting: An integral skid mounted frame, suitable to allow skidding or rolling of transformer in any direction, and with provision for anchoring frame to pad.
10. Insulating Liquids
 - a. Mineral Oil: ASTM D 3487, Type II, and tested for compliance with ASTM D 117.
 - b. Less-Flammable Liquids:
 - 1). Edible-Seed-Oil-Based Dielectric: Listed and labeled by an NRTL as complying with NFPA 70 requirements for fire point of not less than 300 deg C when tested according to ASTM D 92. Liquid shall be biodegradable and nontoxic, having passed the Organization for Economic-Co-operation-and-Development G.L. 203 with zero mortality and shall be certified by the U.S. Environmental Protection Agency as biodegradable, meeting Environmental Technology Verification requirements.
 - 2). Biodegradable and Nontoxic Dielectric: Listed and labeled by an NRTL as complying with NFPA 70 requirements for fire point of not less than 300 deg C when tested according to ASTM D 92.
11. Sound level shall comply with NEMA TR 1 requirements.
12. Corrosion Protection
 - a. Transformer coating system shall be factory applied, complying with requirements of IEEE C57.12.58, in manufacturer's standard color green.
 - b. Fabricate front sill, hood, and tank base of single-compartment transformers from stainless steel according to ASTM A 167, Type 304 or 304L, not less than No. 13 U.S. gauge,

01 - General Requirements

complying with requirements of IEEE C57.12.28, standard color green.

- c. Base and Cabinets of Two Compartment Transformers: Fabricate from stainless steel according to ASTM A 167, Type 304 or 304L, not less than No. 13 U.S. gauge. Coat transformer with manufacturer's standard green color coating complying with requirements of IEEE C57.12.28.
- B. Manufacturers
1. ABB Control, Inc.
 2. Eaton Corporation, Cooper Power Systems.
 3. General Electric Company
 4. S&C Electric Company.
 5. Siemens Energy and Automation, Inc.
 6. Square D, Schneider Electric.
- C. Primary Fusing: Designed and rated to provide thermal protection of transformer by sensing overcurrent and high liquid temperature.
1. 150 KV BIL current-limiting fuses, conforming to requirements of IEEE C37.47.
 2. Interrupting Rating: 50,000 rms Asymmetrical at system voltage.
 3. Fuse Assembly: Bayonet-type, liquid-immersed, expulsion fuses in series with liquid-immersed, partial-range, current-limiting fuses. Bayonet fuse shall sense both high currents and high oil temperature to provide thermal protection to the transformer.
 4. Provide bayonet fuse assembly with an oil retention valve and an external drip shield inside the housing to eliminate or minimize oil spills. Valve shall close when fuse holder is removed and an external drip shield is installed.
 5. Provide a conspicuously displayed warning adjacent to bayonet fuse(s), cautioning against removing or inserting fuses unless transformer has been de-energized and tank pressure has been released.
- D. High-Voltage Section: Dead front design.
1. To connect primary cable, use separable insulated connectors; coordinated with and complying with the requirements of Section "Medium-Voltage Cables". Bushings shall be one-piece units, with ampere and BIL ratings the same as connectors.
 2. Bushing inserts
 - a. Conform to the requirements of IEEE 386.
 - b. Rated at 200 A, with voltage class matching connectors. Provide a parking stand near each bushing well. Parking stands shall be equipped with insulated standoff bushings for parking of energized load-break elbow connectors on parking stands.
 - c. Provide insulated protective caps for insulating and sealing out moisture from unused bushing inserts and insulated standoff

bushings.

3. Load-Break Switch

- a. Radial-feed, liquid immersed type with voltage class and BIL matching that of separable connectors, with a continuous current rating and load-break rating of 200 or 600 amperes, and a make-and-latch rating of 12 KA rms symmetrical.
- b. Switch shall not be located inside the transformer equipment and shall not require hot stick operation for switching of circuit feeds.

E. Low-Voltage Section

1. Bushings with spade terminals drilled for terminating the number of conductors indicated on the Drawings, and the lugs that comply with requirements of Section "Wires and Cables".
2. Metering: Coordinated with and complying with requirements of Section "Powering and Monitoring and Control System". Install the following
 - a. Sensors.
 - b. BAS interface.
 - c. Kilowatt-hour meter.
 - d. Kilowatt-hour demand meter.

F. Capacities and Characteristics

1. Power Rating (KVA): Per design consultant load calc.
2. Voltage Ratings: 12.47 KV - 480/277 V.
3. Taps: Comply with IEEE C57.12.26 requirements.
4. Transformer BIL (KV): Comply with IEEE C57.12.26 requirements.
5. Minimum Tested Impedance (Percent at 85 deg C): 5.5.
6. K-Factor: 1, complying with UL 1562.
7. Comply with FM Global Class No. 3990.
8. Comply with UL listing requirements for combination classification and listing for transformer and less-flammable insulating liquid.

G. Transformer Accessories

1. Drain and filter connection.
2. Filling and top filter press connections.
3. Pressure-vacuum gauge.
4. Dial-type analog thermometer with alarm contacts.
5. Magnetic liquid level indicator with high and low alarm contacts.
6. Automatically resetting pressure-relief device. Device flow shall be as recommended by manufacturer.
7. Stainless-steel ground connection pads.

- 8. Machine -engraved nameplate, made of anodized aluminum or stainless steel.
- 9. Sudden pressure relay for remote alarm or trip when internal transformer pressure rises at field-setrate. Provide without seal-in delay.

MEDIUM VOLTAGE FUSIBLE INTERRUPTER SWITCHGEAR 26 13 16

A. General

- 1. Manufacturer: GE (ABB), Schneider Electric (Square D)
- 2. Metal enclosed switchgear ratings:
 - a. The distribution system will be a grounded delta with two circuits, A and B.
 - b. The ratings for the integrated switchgear assembly shall
 - 1). KV, Nominal 12.47
 - 2). KV, Maximum Design 17.0
 - 3). KV, BIL 95
 - 4). Main Bus Continuous, Amperes 600
 - 5). Short Circuit Ratings Amperes, RMS Symmetrical 40,0006). MVA Three-Phase Symm
 - 7). The momentary and duty-cycle fault-closing ratings of switches, momentary rating of bus, and interrupting ratings of fuses shall equal or exceed the short-circuit ratings of the metal-enclosed switchgear.
 - c. Certification of Ratings
 - 1). The manufacturer shall furnish, upon request, certification of ratings of the basic switch and fuse components and the integrated metal-enclosed switchgear assembly consisting of the switch and fuse components in combination with the enclosure(s).
 - 2). The integrated switchgear assembly shall have a BIL rating established by test on switchgear of the type and kind to be furnished under this specification. Certified test abstracts establishing such ratings shall be furnished upon request.

B. Construction

- 1. Enclosure
 - a. The enclosure of each bay shall be unitized monocoque construction to maximize strength, minimize weight, and inhibit corrosion.
 - b. The basic material shall be 11-gauge hot-rolled, pickled and oiled steel sheet.
 - c. Each bay containing high-voltage components shall be a complete unit in itself, with full side sheets resulting in double-wall construction between bays. Side and rear sheets shall not be externally bolted.
 - d. The base shall be a continuous steel channel of 7-gauge material and

shall extend completely around all four sides of each bay.

e. All hardware (including door fittings, fasteners, etc.), all operating-mechanism parts, and other parts subjects to abrasive action from mechanical motion shall be of either nonferrous materials, galvanized, or zinc-plated ferrous materials.

f. Nominal bay dimensions shall be 46" wide x 46" deep x 90" tall.

2. Doors

a. Doors shall be constructed of 11-gauge hot-rolled, pickled and oiled steel sheet.

b. Doors shall have 90-degree flanges and shall overlap with the door openings.

c. Doors providing access to interrupter switches or interrupter switches with power fuses shall be provided with a wide-view window, constructed of an impact-resistant material, to facilitate checking of switch position without opening the door.

d. Access control shall be provided as follows

1). Doors providing access to interrupter switches only, which are operated by stored-energy type switch operators, shall be mechanically or key interlocked to guard against operating the interrupter switch if the door is open.

3. Screen Doors

a. Each bay or compartment thereof containing high-voltage components shall be provided with a protective screen door, bolted closed, to guard against inadvertent entry to bays containing these components when the enclosure door is open.

b. Each bay containing a control-power transformer shall be provided with a protective screen door, bolted closed, to guard against inadvertent contact with the primary fuse when the enclosure door is open. The screen door shall be interlocked to ensure that the secondary load has been disconnected prior to removal of these fuses.

4. Insulators

a. The interrupter-switch and fuse-mounting insulators, main-bus support insulators, insulated operating shafts, and (if applicable) push rods shall be of a cycloaliphatic epoxy resin system or of a porcelain system.

5. High-Voltage Bus

a. Bus and interconnections shall consist of copper bar of a minimum 98% IACS conductivity.

b. The bus supports, bus, and interconnections shall withstand the stresses; associated with short-circuit currents up through the maximum rating of the switchgear.

6. Ground Bus

a. A ground bus of short-circuit rating equal to that of the integrated assembly (or a ground connection, in the case of single-bay switchgear) shall be provided, maintaining electrical continuity throughout the integrated assembly.

b. The ground bus shall consist of aluminum bar of a minimum 56% IACS conductivity.

c. Bolted connections shall be as specified for the main bus, except that

only one Belleville springwasher shall be required per bolt for attachment of ground bus to the nickel-plated steel bracket.

- d. For multi-bay metal-enclosed switchgear assemblies, two ground cable connectors accommodating No. 2 through 500kc mil conductors shall be provided for connection of ground bus to station ground.

7. Low Voltage Components

- a. All low-voltage components, including switch operators not integrally mounted in the switchgear, meters, instruments, and relays, shall be located in grounded, metal-enclosed compartments separate from high voltage to provide isolation and shall be arranged to allow complete accessibility for operation without exposure to high voltage.
- b. Low-voltage wiring, except for short lengths such as terminal blocks and the secondaries of sensing devices, shall be in grounded conduit, cable trays, or raceways where necessary to isolate such wiring from high voltage.

8. Cable-Termination Space

- a. Provide full front access for easy positioning and removal of cable pulling sheaves.
- b. Provide free access without interference from non-removable structural members or from mechanical linkages between the interrupter-switch blades and operating mechanism.

9. Finish

- a. The finish shall be light gray, No. 61 ANSI Standard Z55.1.
- b. A packaged kit of refinishing materials - with complete instructions - shall be included with each shipment of metal-enclosed switchgear for touch-up in the field.

10. Louvers shall be provided at the top and bottom of the front and rear of each bay.

11. Lifting eyes shall be removable.

C. Basic components

1. Interrupter Switches

- a. Interrupter switches shall have a one-time or two-time duty-cycle fault-closing rating equal to or exceeding the short-circuit rating of the integrated switchgear assembly. These ratings define the ability to close the interrupter switch either alone (unfused) or in combination with the appropriate fuse, once or twice (as applicable) against a three-phase fault with asymmetrical current in at least one phase equal to the rated value, with the switch remaining operable and able to carry and interrupt rated current.
- b. Interrupter switches shall utilize a quick-make mechanism. For interrupter switches operated by stored-energy switch operators, the quick-make mechanism shall be integral part of the switch operator.
- c. Interrupter switches shall be provided with a single blade per phase for circuit closing including fault closing, continuous current carrying, and

circuit interrupting. Spring-loaded auxiliary blades shall not be permitted.

- d. Circuit interruption shall be accomplished by use of an interrupter which is positively and inherently sequenced with the blade position. Circuit interruption shall take place completely with the interrupter, with no external arc or flame. Any exhaust shall be vented in a controlled manner through a labyrinthine muffler or a deionizing vent.
- e. Interrupter switches shall have a readily visible open gap when in the open position to allow positive verification of correct switch position.
- f. Entrance and tie modules shall have key interlocks to guard against access to fuses unless all switches are open.

2. Power Fuses

- a. Each main and feeder switch module shall be fused with electronic fuses, S and C Fault Filter, no known equal, sized as scheduled on the drawings.
- b. Fuses for the service entrance modules shall have inverse-curve-type time-current characteristics. Fuses for the feeder modules protecting transformers in unit substations shall have time-delayed compound-curve-type time-current characteristics.

3. Voltage-Sensing Devices

- a. Voltage-sensing devices for use with open-phase detectors shall be capacitively coupled voltage sensors on three phases.
- b. The voltage sensors shall directly replace apparatus insulators at the hinge end of fuses or the lower terminal of interrupter switches. Voltage sensors shall be constant-current-output devices that do not require primary fuses.
- c. The output voltage of the voltage sensors shall be directly proportional to line-to-ground voltage and shall have relay accuracy over an ambient temperature of -40°F to +160°F.
- d. The output of the voltage sensors shall be connected to a secondary burden that does not require adjustment to compensate for a difference between system line-to-ground voltage and the sensor's rated nominal line-to-ground voltage.
- e. There shall be test jacks and adjustment screws to allow for measuring and adjusting the voltage-sensors signal inputs.

4. Arrestors

- a. Cable terminations shall be furnished with each switch and shall be made with modular non-tracking rubber cable terminators with integral internal stress relief device. Terminators for use on 15 kV grounded wye system shall be rated at 15 kV with 110 kV, 1.2 x 50 wave and 30 kV corona extinction. Provide cable terminations for the quantity and size of cables for each switch.

LOW-VOLTAGE TRANSFORMERS

26 22 00

A. General

01 - General Requirements

1. Transformer cooling fans or moving parts may not be used, except in unit substation equipment.
2. All dry type transformers rated 15 kVA and larger shall have two 2 -1/2 percent full capacity taps above normal (FCAN) and four 2-1/2 percent full capacity taps below normal (FCBN) rated primary voltage.
3. Dry type transformers shall be copper-wound. Temperature rise ratings shall comply with:
 - a. 25 KVA and smaller; Insulation Class 185 degrees C, 115 degrees C temperature rise.
 - b. 30 KVA and larger; Insulation Class 220 degrees C, 150 degrees C temperature rise.
4. Provide hinged lockable doors on transformers.
5. Transformers shall meet the following sound level ratings:
 - a. 0 - 9 KVA 40 dB
 - b. 10 - 50 KVA 45 dB
 - c. 51 - 150 KVA 50 dB
 - d. 151 - 300 KVA 55 dB
 - e. 301 - 500 KVA 60 dB
 - f. 501 - 750 KVA 62 dB
6. Provide K rated transformers where required in the contractor prepared power system study harmonics section or where known nonlinear loading exists.
7. Housekeeping pads are required for floor mounted transformers. Provide external vibration isolators.
8. Transformers shall meet US Department of Energy's Candidate Standard Level Three (CSL-3) efficiency. Transformers shall be designed to exceed the latest requirements of the California Code of Regulations Title 20 and Title 24 and NEMA TP-1 efficiency standards. Transformer efficiency shall meet or exceeds the January 1, 2016 energy efficiency levels listed in DOE 78 FR 23335 (April 18, 2013), 10 CFR 431.196 or the most current energy standards if more stringent
9. Use flexible conduit indoors in dry locations or liquid-tight flexible conduit in damp/wet locations, two-foot minimum in length, for primary and secondary connections to transformer case. Make connections to side panels of enclosure, except for floor mounted transformers fed from directly below enclosure.
10. Transformers not specifically designed for wall mounting, shall be spaced a minimum of 6" from adjacent walls, ceiling and equipment.
11. Install the transformers on the noise and vibration isolation pads designed to suppress the transformer noise from the building structure. Select and arrange the pads in accordance with the weight and mounting of the transformers. These pads are in addition to any internal vibration pads. Provide a neoprene sleeve over the portion of the bolt that passes through the transformer base or mounting bracket. Provide a rubber washer between the bolt head and the mounting channel.

12. Provide noise and vibration analysis when transformers are installed above ground level.

SWITCHBOARDS & PANELBOARDS

26 24 00

A. General

1. All switchboard and panelboard bussing shall be copper.
2. All neutral bussing shall be 200% rated. Increase neutral ratings of feeders to 150% or 200% when K rated transformers are used or as coordinated with the expected harmonic profile of the loads served.
3. Provide a listed surge protective device (SPD) on all emergency power system panels and switchboards.
4. Board breakers shall match the kAIC rating and manufacturer of the enclosure.
5. Switchboard and panelboard manufacturers shall be:
 - a. ABB/General Electric (GE)
 - b. Square D (Schneider Electric)

B. Panelboards general:

1. Panelboards shall be furnished with door in door style hinged trims.
2. Provide board with integral lock. All boards on the project shall be keyed alike.
3. Ground bus shall be full size, include an isolated ground bus when isolated grounding equipment is utilized.
4. Boards shall be rated for fault current as coordinated with results of contractor prepared power system study, and minimums as follows:
 - a. 120/208 volt branch circuit panels 10,000 AIC
 - b. 120/208 volt distribution panels 18,000 AIC
 - c. 277/480 volt branch circuit panels 35,000 AIC
 - d. 277/480 volt distribution panels 42,000 AIC
5. Main circuit breakers shall be bus connected to the panel, vertically mounted, and not group aligned in branch breaker positions, include lockoff hardware.
6. When required provide a digital Panelboard metering System. The system shall be provided with all features and requirements necessary to interface with the existing infrastructure. Upgrades in the existing BMS, GE PMCS, or Metasys systems shall be provided as necessary to integrate the panelboard metering system.
7. Branch breakers shall be bolt on style molded case, thermal magnetic trip type.
8. Include adjustable trip breakers where required to achieve selective coordination or limit fault current as coordinated with the results of the contractor prepared power system study.
9. Stub (2) spare one-inch conduits to accessible location above ceiling out of each recessed panelboard.

10. Provide a typewritten index of circuits inside the door of the panelboard. Type directing to indicate actual field installation, with odd numbering on left and even numbering on right.
 - a. Load descriptions must be accurate. Do not just label loads as "receptacles or lighting".
 - b. The room numbers and locations of the loads/devices MUST be included in the description.

C. Switchboards general

1. All switchboards sections shall be front or rear accessible factory-assembled, dead front, metal-enclosed, and self-supporting.
2. Switchboard short circuit withstand rating shall be minimum 65,000AIC unless otherwise coordinated.
3. Main circuit breaker shall be power drawout type or insulated case circuit breakers, individually mounted.
4. Feeder circuit breakers shall be group mounted, 100% rated for continuous duty.
5. Include electronic fully adjustable trip breakers where required to achieve selective coordination or limit fault current as coordinated with the results of the contractor prepared power system study.
6. Provide a microprocessor-based power metering System. The system shall be provided with all features and requirements necessary to interface with the existing GE PMCS Systems and the existing JCI Metasys system. Upgrades in the existing GE PMCS and Metasys systems shall be provided as necessary to integrate the panelboard metering system.
7. When installing new switchboards in Type 1 OSHPD projects provide power drawout circuit breakers for all breakers in the switchboards.
8. Double ended main and tie breakers shall be individually mounted and arranged for drawout construction. Feeder devices shall be individually mounted for drawout construction and compartmentalized. All circuit breaker devices shall be individually removable from the front of the switchboard.
9. Provide a trolley system at the top of switchboards when utilizing power drawout style circuit breakers.
10. Include neutral to ground disconnect link at service rated equipment installations.

WIRING DEVICES

26 27 26

A. General

1. All devices installed at medical facilities shall be hospital grade, 20 amp minimum.
2. All devices installed at teaching and non OSHPD office facilities shall be heavy duty industrial grade, 20 amp minimum.
3. All electrical devices and switches shall have engraved device covers, Critical, life safety, and equipment branch devices shall have devices in

red and nameplates engraved in red text. Normal branch devices shall have nameplates engraved in black text. All other device colors shall be as coordinated with the project architect or the University Representative.

4. Ground fault circuit interrupter (GFCI) receptacles: 3 wire grounded, white, or match existing finish, rated 20 amps, 125V. All GFCI devices shall be standalone type, not feed through protected.
5. Provide locking covers for exterior weatherproof outlets. All exterior receptacles shall be weatherresistant type, GFCI.
6. Device covers shall be stainless steel type and engraved for panel and circuit. In tamper proof areas such as pediatrics and psychology provide tamper proof devices and screws
7. Mount receptacle vertically with the grounding U at the top. For horizontally mounted receptacles mount receptacle with neutral side Up
8. Branch circuiting for the life safety, critical, and equipment branch devices shall have dedicated neutrals. All circuits in patient rooms shall have dedicated neutrals.
9. Provide controlled receptacles as coordinated with California Title 24. An optional strategy using any alternate compliance via computer software shutdowns may be discussed with the AHJ.
10. Unless otherwise noted on drawings, mounting heights to center of devices shall be as follows:
 - a. Switches: 42 inches
 - b. Receptacles: 18 inches

B. Telecommunications Space Electrical Requirements

1. Convenience duplex receptacles shall be installed on a 20A/1P dedicated circuit in the room.
2. Where Equipment Rack and Cabinets exist with active electronics, power connections are required. Coordinate with the University Representative and IT to confirm how many powered rack locations are required in each telecom space. At a powered rack location provide:
 - a. One (1) duplex 20 Amp, 120V AC NEMA 5-20R-receptacle on normal power above the rack.
 - b. One (1) 120/208V, 3 phase, 5 wire, NEMA L21-30R-receptacle on normal power above the rack.
 - c. One (1) 120/208V, 3 phase, 5 wire, NEMA L21-30R-receptacle on UPS power above the rack.
 - d. All UPS power configurations shall be evaluated on a case by case basis with the University Representative and IT to determine desired UPS system configuration (central vs. rack mount vs. other)

LOW-VOLTAGE CIRCUIT PROTECTION DEVICES

26 28 00

A. General

1. Overcurrent protective devices shall satisfy all CEC mandated selective

coordination requirements(e.g. CEC Articles 517, 620, 645, 695, 700, 701, 708) in addition to any project specific selective coordination requirements above and beyond CEC requirements.

2. Series ratings of breaker devices shall not be used.
3. Breakers installed in equipment shall match the manufacturer and kAIC rating of the equipment.
4. Mounting shall be "bolt-on" type, removable without disturbing any other breaker.
5. Molded case circuit breakers shall not be used above 800 amps.
6. Insulated case circuit breakers shall be used above 800 amps.
7. Power circuit breakers shall be used in service switchboards, unit substations, and OSHPD type 1 buildings.
8. Circuit breakers serving the fire alarm system shall be red in color.
9. Include lock off hardware for maintenance and lock out tag out.
10. Over current protective devices shall be provided with trip styles, adjustability features, frames, kAIC ratings, and coordination characteristics as coordinated with the results of the contractor prepared power system study. All adjustable breaker settings shall be field set by the contractor and tested.

ENCLOSED CONTROLLERS (MOTOR STARTERS)

26 29 13

A. General

1. Provide single phase manual motor switches (MMS) for all motors smaller than ½ hp unless indicated otherwise. For all motors ½ HP and larger or as indicated on the drawings, provide 3phase full voltage magnetic across the line starters
2. Auxiliary Contacts - Each starter to have a minimum of two Normally Open (NO) auxiliary contacts with provision to add a minimum of two more.
3. Selector Switch -To have HOA (Hand-Off-Auto) selector switch mounted in cover.
4. Pilot Light - Red LED pilot light mounted in cover to be activated through a starter auxiliary contact, (not across the coil, or parallel with the coil).

AUTOMATIC TRANSFER SWITCHES (ATS)

26 36 00

A. General

1. Transfer switches shall be closed transition bypass isolation type. The transfer switch shall be Draw-out with self-aligning jaws.
2. Switches shall be closed transition type but capable of programming for open and/or adjustable time delayed transitions.
3. Switches shall be four pole type everywhere when a neutral accompanies the feeder, as coordinated by the electrical engineer, with facility ground fault protection scheme and separately derived sources.

4. Switches shall be UL 1008 listed.
5. Coordinate new transfer switch withstand and closing rating (WCR) with all circuit breaker settings to ensure selective coordination of breaker short time settings.
6. Switch shall be provided with a separated and isolated digital user control panel. Panel shall be mounted at the face of the switch, have visual display for current switch status, with touch screen to
 - a. Adjustments for all separate time delays, exerciser, transfer status, ATS statistics, and historical event log.
 - b. Power quality meter monitoring information for voltage, frequency, phase, KW, KVA, PF, and trending.
7. Include communications modules capable of integration to the building management system via RS485, Modbus TCP/IP, BACnet IP and SNMP protocols.
8. Switches shall be furnished with normally open/closed 125V DC contacts (use the closed contacts) for integration with the central plant 125V DC start/stop signaling system.
9. New ATS equipment shall have position monitoring via the BMS and be furnished with selective load shed capabilities for interface to the future UC Davis Health campus load shed add scheme. Per CEC 517.31(B) Optional standby CUP served ATS equipment shall be shed in the event of overloading.
10. Provide generator start circuit monitoring system.
11. Manufacturer shall be ASCO, series 7000
12. In the Hospital, a Remote Status Panel is located in the Fire Command Center and communicates via RS 485 port from each transfer switches respective microprocessor control panel. Provide LED indicators for each automatic transfer switch in the Fire Command Center. These LED's shall consist of a red lamp to indicate connection to the emergency source and a green lamp to indicate connection to the normal source, one lamp of each color for each automatic transfer switch. Clearly label each pair of red/green lamps as to which ATS they are indicating, pole branch of the ATS and the floors or area served, i.e., "ATS-EQ, equipment branch."
13. Transfer switch to have a full rated neutral with lugs for NORMAL, EMERGENCY and LOAD neutral conductors inside cabinet (4 pole with a switched neutral). Equipped with direct acting linear operators for simple, reliable and fast acting during automatic operation.

SURGE PROTECTIVE DEVICES

26 43 13

A. General

1. Provide surge protective device (SPD) equipment having the electrical characteristics, ratings, and modifications as specified herein and as shown on the drawings. To maximize performance and reliability and to obtain the lowest possible let-through voltages, the ac surge protection shall be integrated into electrical distribution equipment such as switchgear, switchboards, and panelboards.

2. The SPD must include Form C dry contacts (one NO and one NC) for remote annunciation of its status. Both the NO and NC contacts shall change state under any fault condition. Device shall have an audible alarm under any fault condition.
3. SPD units shall be furnished in two Types. Type 1 and Type 2 as outlined below:
 - a. Type 1: Permanently connected SPDs installed on the line or load side of main disconnect device(s), at main switchboards. This type closely relates to the devices previously referred to as secondary surge arrestors. These Type 1 SPDs should be specially suited to conduct the high energy impulses from lightning strikes.
 - b. Type 2: Permanently connected SPD installed on the load side of the service panel main disconnect device(s). This type most closely relates to devices that were previously classified as Transient Voltage Surge Suppression (TVSS). These Type 2 SPDs are especially suited for distribution boards and panelboard applications.
4. All SPDs shall be tested and demonstrate suitability for application within ANSI/IEEE C62.41 Category C, B, and A environments. The minimum surge current capacity the device is capable of withstanding shall be as shown in the following table

Minimum Surge Current Capacity Table			
Category	Application	Per Phase	Per Mode
C	Service Entrance Locations	250kA	125kA
B	High Exposure Roof Top Locations (Switchboards and Panelboards)	160kA	80kA
A	Branch Locations (Panelboards)	120kA	60kA

5. All SPDs installed on the line side of the service entrance disconnect shall be Type 1 SPDs. All SPDs installed on the load side of the service entrance disconnect shall be Type 1 or Type 2 SPDs.

INTERIOR LIGHTING

26 51 00

A. General

1. All interior lighting fixtures shall be LED type. UL 8750 recognized or listed as applicable. UL listed or Nationally Recognized Testing Laboratory

(NRTL) listed.

2. All interior lighting shall have a Kelvin color temperature of 3,500K.
3. A minimum Color Rendering Index (CRI) of 90 shall be used for all fixtures.
4. Fixtures shall utilize 0-10v dimming as the standard controls protocol but other technologies may be implemented, as coordinated with the projects lighting control system.
5. IESNA L70 lifetime minimum 80,000 hours. Tested in accordance with IESNA LM-79 and IESNALM-80 test data.
6. Minimum efficiency of 90 lumens per watt and on the Design Lighting Consortium's (DLC) current qualified Products list (QPL).
7. Recessed luminaires in suspended ceilings shall be supported by connecting two support wires to the luminaire at diagonal opposite corners for luminaires weighing 56 pounds or less. Connect four wires, one at each corner for luminaires weighing more than 56 pounds.
8. All concealed junction box cover plates for the lighting branch circuit system shall be clearly marked with a permanent black ink felt pen identifying the branch circuit (both panel designation and circuit number) contained in the box.
9. Lighting levels shall conform to Illuminating Engineering Society of North America (IESNA) standards (see the IESNA Lighting Handbook: Reference & application or the IESNA Lighting Ready Reference). Zone lighting or task lighting shall be utilized whenever energy efficiency can be improved by these measures. Comply with current California Title 24 Energy Code published by the California Building Standards Commission.

B. Fixtures

1. All fixtures shall utilize LED modules and compatible drivers unless otherwise noted. Provide recessed and surface fixtures with all mounting hardware and mounting ceiling trims for a complete installation in the type of ceiling which they are intended to be installed. Provide access to LED modules and drivers through the lens or below the ceiling, without the removal of the entire fixture or permanent ceiling.
2. Pendant mounted fixtures to be provided with mounting cable, stems, ball aligners, feed cable, canopies, swivel hangers, safety cables and all mounted hardware to conform to the state of California Seismic safety standards. In indirect linear systems provide clear dust covers to facilitate cleaning. Covers to be manufacturer provided, not field fabricated.

C. Led Lighting Drivers

1. LED type. UL 8750 recognized or listed as applicable. UL listed or Nationally Recognized Testing Laboratory (NRTL) listed.
2. Drivers to be UL listed or NRTL listed for the type of load that they are used. Compliant with California Energy Code requirements.
3. Compatibility of driver and LED light engine must be tested and ensured by fixture manufacturer. Warranty of the fixture, driver and light engine by the fixture manufacturer. Provide manufacturer's warranty covering 5 years on drivers from date of installation.

4. Inaudible in a 27 dBA ambient.
5. No visible change in light output with a variation of +/- 10 percent line voltage input.
6. Make replacements available for minimum of ten years from date of manufacture.
7. Drivers shall have a maximum THD of 20%.

D. Specialty Applications

1. In MRI rooms provide luminaires with high CRI and low level dimming 100-1% and off. Utilize only LED fixtures to meet or exceed TESLA rating of MRI machines within the procedure rooms. Dimming 100-1% and off in control area. All luminaires to have cleanable surfaces.
2. In radiology, ultrasound, Nuclear Camera, CT Scanner, mammography and other similar use rooms, provide high CRI and low level dimming 100-1% and off. Multi-system preferred. Dimming 100-1% and off in control area. All luminaires to have cleanable surfaces.

E. Exit Signs

1. General
 - a. LED color shall be red. Face color white, painted metal. Provide clear polycarbonate vandal-resistant shields outdoors, in parking structures and where required by the use of the space.
 - b. Provide face configurations, chevron directional arrows, and canopy or wall mounting provisions (universal installation type) as coordinated with the egress plan.
 - c. Tritium exit signs shall not be used on the UC Davis Health campus. Where existing tritium exit signs are found in areas of remodel, they shall be disposed following EPA guidelines. And replaced with LED type.
 - d. Connect exit signs to unswitched emergency circuit where available in the building. Where emergency circuits or inverter are not available provide self-powered exit signs.

EXTERIOR LIGHTING

26 51 10

A. General

1. All exterior lighting fixtures shall be LED type with a kelvin color temperature of 4,000K.
2. Minimum color rendering index (CRI) of 80, with a minimum of 80,000 hours, and an efficiency of 80 lumens per watt and be on the DLC's QPL.
3. Provide fully gasketed, exterior fixture lens and diffuser frames to prevent moisture, debris, and insects from entering the fixture housing.
4. Site lighting fixtures shall be provided to match the existing UC Davis Health campus standard fixtures: Gardco style CA. Include concrete foundations
5. All junction box cover plates for site lighting shall be clearly marked on the inside with a permanent black ink felt pen identifying the branch circuit

(both panel designation and circuit number) contained.

6. All fixtures shall be designed to minimize light pollution and glare, while meeting the light distribution requirements for a given area. A designation of full cutoff shall be considered, but not the sole criteria in evaluating a fixture's ability to minimize light pollution and glare.

COMMUNICATIONS

27 00 00

A. Telecommunications Spaces (TS)

1. The industry term "Telecommunications Spaces," when used, shall refer to Equipment and Telecommunications Rooms (TR)
2. Entrance Facility Room (ER)
3. Telecommunications Room (TR)
 - a. Every building is served by at least one (1) TR or ER, with a minimum of one (1) TR per floor.
 - 1). The TR is a building serving space providing a connection point between campus backbone cables and the building infrastructure system.
 - 2). The TR provides a connection point between backbone and horizontal infrastructures, Work Area Outlet (WAO) locations.
 - b. TR's shall be designed and provisioned according to the requirements in ANSI/TIA/EIA-569-B.

B. Design Criteria for Telecommunications Spaces:

1. Dedicate TS to the building's telecommunications function and related support facilities.
2. Do not share TS with any equipment or services other than those required in direct support of the telecommunications equipment and services without written approval from the University Representative.
3. Locations
 - a. TS should not be located near potential sources of electromagnetic interference (EMI), near radio frequency interference (RFI), near sources of mechanical vibration, or in places subject to any corrosive atmospheric or environmental conditions.
 - b. Avoid locations that limit expansion such as structural steel, stairwells, and elevator shafts, outside walls or other fixed building walls.
 - c. TS should be located as close as practical to the center of the area served and preferably in the core area, in easily accessible locations, and accessible directly from public hallways (e.g., not through offices or other utility spaces).
4. Have easy access to distribution cable pathways.
5. Cable Lengths
 - a. Minimize the length of the backbone and horizontal distribution cables: 1). Do not exceed

295' for any individual cable run.

2). The average horizontal cable run shall be 150' or less.

- b. Building entrance cables shall not be exposed for a cable length distance of more than 50' per the current CEC.

C. Design Criteria

1. Telecommunications Spaces shall be:
2. Dedicated to the building's telecommunications function and related support facilities and shall not be shared with electrical, building services or any equipment other than those required in direct support of the telecommunications equipment and services without written approval of the

University Representative. Nor shall they be located near potential sources of electromagnetic interference (EMI), radio frequency interference (RFI), or sources of mechanical vibration.

3. Located above water level or not in a place subject to any corrosive atmospheric or environmental conditions.
4. Located as close as practical to the center of the area served and preferably in the core area. Avoid locations that limit expansion such as structural steel, stairwells and elevator shafts, outside walls or other fixed building walls.
5. The average horizontal cable run is 150' or less and no individual cable run shall exceed 295'. Building entrance cables shall not be exposed for a cable length distance of more than 50' per the current California Electrical Code.
6. Easily accessible and accessed directly from public hallways and not through offices or other utility spaces.
7. Easily accessible to distribution cable pathways.
8. Vertically aligned (stacked) within a multistory building. Horizontal pathways shall terminate in the TS located on the same floor as the area being served.
9. Meet Seismic Zone 4 requirements.
10. Equipment and piping not related directly to the support of the telecommunications function shall not be installed in, pass through, pass overhead or enter the telecommunications space. Pipes for sprinkler heads located within the room shall not be located directly above electronic equipment racks and/or cabinets.

D. Room Sizing

1. There shall be a minimum of one (1) Telecommunication Space (TS) per floor. One (1) additional TS for each area up to 10,000 sq. ft. shall be provided when the floor area to be served exceeds 10,000 sq. ft or the horizontal distribution distance to the workstation exceeds 295'. See Table 1.
2. If the floor area is over 10,000 sq. ft., then the TS size shall be increased, based upon 0.75 sq. ft. for every additional 100 sq. ft. of usable space the TS will support.

Table 1: Telecommunications Space (TS) Dimensions

Serving Area	Minimum Room Size
5,000 sq. ft. or less	10' wide x 8' long
5001sq. ft to 8,000 sq ft.	12' wide x 9' long
8,001 sq. ft. to 10,000 sq. ft.	15' wide x 10' long

3. The sizes of all telecommunications spaces listed are minimum requirements. Depending on the requirements and services performed by the building occupants, additional space may be required. Larger size buildings and building programs may require additional rows of equipment racks or cabinets. Contact the University Representative for specific instructions.
- E. TS Layout (General)
1. See Figure 1 for recommended TS Layout.
 2. Lighting shall not receive power from the same electrical distribution panel breaker as the telecommunications equipment in the TS.
 3. Doors
 - a. Doors shall be fire rated as dictated by the CBC.
 - b. Double Doors: Shall be 6' wide by 7' -5" high and shall be provided without a threshold or center post.
 - c. Doors that open to an outside environment shall be rated for exterior use and shall have a weatherproof gasket to prevent vermin, water, dirt and dust from entering the room. A positive pressure type of HVAC system shall be installed in this type of TS. Contact the University Representative for keying and door handle specifications.
 - 1). Minimum distributed load rating of 100 lb./ft² and a minimum concentrated load rating of at least 2000 lb./ft².
 - 2). Minimum load rating of 50 lb./ft².
 4. TS door shall be fire rated as dictated by local code requirements. If required, double door 6' wide by 7', 5' high without a doorsill and center post is recommended. TS doors that open to an outside environment shall be rated for exterior use and shall have a weatherproof gasket to prevent vermin, water, dirt and dust from entering the room. A positive pressure type of HVAC system shall be installed in this type of TS. Contact the University Representative for keying and door handle specifications.
 - a. Minimum distributed load rating of 100 lb./ft² and a minimum concentrated load rating of at least 2000 lb./ft².
 - b. Minimum load rating of 50 lb./ft².
 5. Ceilings are to be open to the underside of the floor or deck above and have a minimum clearance of nine feet.

6. See Figure 1 for equipment and cross-connect field clearances in the Telecommunications Spaces.
7. A stand-alone HVAC unit shall be provided for the telecommunications space. The filters in the HVAC system should have an ASHRAE dust spot rating of 85% or better. Temperature 68- 72°Fahrenheit. Humidity between 30-55%.
8. The back wall of the Telecom Room, behind the equipment racks, shall be dedicated for low voltage security equipment. Contractor to provide a submittal of the low voltage equipment conduit route that will be entering the Telecom Room. Conduits shall be installed in a clean, neat and organized fashion. The University Representative shall coordinate approvals on submittal, installation and field changes.

Figure 1 Typical TS Layout

9. Duplex convenience receptacle shall be placed every 6' and mounted at 18" AFF around the perimeter of the room, min of two (2) 20 AMP dedicated circuits. No more than four (4) outlets on one (1) circuit. Alternate outlet circuits around room. Provide on emergency power, if available.
10. Mount 2 Duplex 20 AMP 120 VAC NEMA5-20R dedicated branch circuits in quad box mounted at 15" AFF on back of each rack. Use min

of 24" of flex conduit to attach electrical service to the equipment rack to prevent shearing of conduit during a seismic event. Electrical EMT and/or flex conduit shall not pass through the overhead cable ladders. Provide on emergency power, if available.

11. Ladder rack shall be 18" wide and mounted at 7'-6" AFF. Do not attach to racks. Support ladder rack overhead, not the walls, with a min of ½-inch threaded rod.
12. Seismic 2-post open frame rack, or equal.
13. 6" D-ring cable manager.
14. Sleeves shall enter 2" without a bend at 8"-6" AFF and in-line with the overhead ladder rack.
15. Line all walls with ¾" x 4' x 8' void-free fire-treated plywood and painted on all sides with two coats of white fire-retardant paint. Tape off and expose one stamp per sheet of plywood. Start at 6" AFF.
16. A min of 2'-6" clearance shall be maintained at one end of row and 3'-6" in front of open frame racks. Allow min 36" aisle between each row of racks.
17. 110 block wall field.
18. Overhead lights shall be located a minimum of 8'-6" AFF. Minimum 50' candles measured at 3' AFF.
19. Electrical panel and emergency lights shall be on emergency power, if available.
20. Digital Loop Carrier to be provided by UC Davis Health. DLC requires a dedicated 20 AMP 120VAC NEMA 5-20R receptacle placed at the top of the rack at 66" AFF. Total of 16,000 BTU's for the DLC.
21. Entrance conduits shall enter 3-4" AFF without a bend.
22. Entrance door min 3' x 6'-7" w/ gasket to prevent dust. No glass viewing or louver panel in door.

Provide crescent key core. Entrance door shall open outward when possible.

23. Floors shall be sealed concrete. Removable floors shall be of a tile-type surface. Concrete and tile floors shall be sealed with an anti-static coating.
24. NOTE: The type and location of the cross-connect fields may influence the optimal placement of pathways.

Note: In many cases, equipment and termination hardware may extend beyond racks and backboards. It is important to note that the clearance is measured from the outermost surface of these devices, rather than from the mounting surface of the rack or backboard.

25. Drainage troughs that provide a drain to route water outside of the TS shall be placed under the sprinkler pipes to prevent leakage onto the electronic equipment.
26. Under floor fire detection system shall be a cross-zone detection system. Placement of the detector may affect the way cables are routed under a raised floor. Provisions shall be made in the fire detection system design to reduce the possibility of false alarms and activation of

a fire suppression system when ionization detectors are installed.

F. Equipment Rack and Cabinet Electrical Requirements

1. Duplex convenience receptacle shall be placed every 6' and mounted at 18" AFF around the perimeter of the room, min of two (2) 20 AMP dedicated circuits. No more than four (4) outlets on one circuit. Alternate outlet circuits around room.
2. Mount two (2) Duplex 20 AMP 120 VAC NEMA 5-20R dedicated branch circuits in quad box mounted at 15" AFF on back of each rack. Use min of 24" of flex conduit to attach electrical service to the equipment rack to prevent shearing of conduit during a seismic event. Electrical EMT and/or flex conduit shall not pass through the overhead cable ladders.
3. Special considerations:
 - a. ADF and DLC require standard 20 Amp, 120V AC NEMA 5-20R-spade receptacles.

G. Design Requirements

1. Work Area Outlets (WAO)
 - a. Power receptacles should be installed near each WAO location (i.e., within 3'). Install WAO at the same height as the power receptacles. A minimum of one (1) WAO location containing two (2) Data NAMs (Network Access Module) or jacks shall be installed per work area.
 - b. For office areas, provide a minimum of two (2) separate WAO locations. They shall be located to offer maximum flexibility for change within the work area (i.e., on opposing walls).
 - c. Provide a NAM for a clock in each classroom. The NAM shall be flush-mounted roughly 8'-6" AFF.
 - d. Provide a NAM for an IPTV location when a TV is required.
2. Open office area interior design, telecommunications and power system distribution planning should be coordinated to eliminate placement discrepancies. Coordinate review with the University Representative.

H. Building Management WAOs

1. A minimum of one (1) WAO consisting of two (2) Data NAMs shall be installed at the Fire Alarm

Control Panel (FACP). NAM shall be located outside the FACP in an indoor-rated box with a hinged cover. A conduit will need to be provided from the box to the FACP.

2. A minimum of one (1) WAO of one (1) Data NAM shall be installed for each elevator bay (incl. wheelchair lifts) in the Elevator Control Room within the control panel. The NAM is to be placed within a Hoffman 8"x6"x4" indoor rated box with a hinged cover, or equal. A conduit will need to be provided from the box to the elevator room control panel.
3. A minimum of one (1) WAO of two (2) Data NAMs shall be installed within the Building Management System (BMS) Control Panel.

4. A minimum of one (1) WAO of two (2) Data NAMs shall be installed within the Lighting Control Panel (LCP).
 5. A minimum of one (1) WAO of one (1) Data NAM shall be installed within the Power Monitoring (PML) Control Panel.
 6. A minimum of one (1) WAO of two (2) Data NAMs shall be planned for any Building Access Systems (card readers, cameras.) within the Security Control Panel.
 7. Provide note on the drawings for electrician to coordinate Building Management NAMs final locations with the University Representative, the Telecom and Electrical Inspector and the respective building systems contractors.
- I. Courtesy, pay, text, emergency and wheelchair elevator telephones
 1. Comply with the CBC Accessibility Guidelines.

COMMON WORK RESULTS FOR COMMUNICATIONS

27 05 00

- A. Work performed in this segment shall be designed and installed per the following most current edition
 1. California Electrical Code (CEC).
 2. National Electrical Safety Code (NESC)
 3. TIA-758-A Specifications for Outside Plant Construction.
- B. Coordinate with the University Representative for best cable distribution method along the proposed cable route.

GROUNDING & BONDING FOR COMMUNICATION SYSTEMS

27 05 26

- A. General
 1. The following standards are to be adhered to
 - a. ANSI J/STD-607-B, Commercial Building Grounding (Earthing) and Bonding Requirements for Telecommunications,
 - b. ANSI/TIA/EIA-606-B Administration Standards for the Telecommunications Infrastructure of Commercial Buildings.
 - c. BICSI guidelines.
 - d. National Electrical Code (NEC).
 - e. California Electrical Code Article 250 and references therein.
 - f. California Electrical Code Article 800.
 2. In the event of conflicting requirements, the most restrictive requirement shall prevail.
 3. Compliance with the National Electrical Code (NEC) and local codes mandated by the authority having jurisdiction.
 4. If the designer finds a conflict between a local safety code, BICSI guidelines and the manufacturer's requirements, the conflict should be resolved with the authority having jurisdiction before proceeding. the

conflict shall be resolved with the University Representative before proceeding.

5. Telecommunications Bonding Infrastructure

- a. In addition to the normal electrical ground system, a Main Telecommunications Ground Busbar (MTGB) and a Telecommunications Ground Busbar (TGB) system are required per ANSI/EIA/TIA-STD-J-607-B.
 - 1). A TMGB shall be located in the ER / TR / TS and is to be bonded to the nearest approved building grounding electrode (e.g., structural steel or ground rod) and the equipment grounding system (ac branch circuit panel board's equipment grounding busbar) by conventional welds, exothermic welds, clamp-and-braze method or UL- approved two-hole compression type connectors where practical. Exothermic welds are preferred.
 - 2). In each TR, a TGB shall be installed and bonded to the electrical panel (may be located in a different room) serving the area where the TGB is installed, bonded to building steel and bonded in series to the main TMGB.
 - 3). In a renovation or remodeling project where a suitable ground to the electrical service ground is not available, a grounding electrode shall be installed in accordance with the CEC.
 - 4). Bonding conductors shall be green or marked with a distinctive green color, labeled and routed with minimal bends or changes in direction.
 - 5). A grounding equalizer (GE) is not required.
 - 6). The TBB should be calculated for a size that conforms to the guidelines set by the NEC.
 - 7). Multiple busbars are used where multiple ERs, TRs and EFs exist in large buildings.
 - 8). Provide a grounding riser diagram in the contract drawings.
 - 9). Two-hole compression ground lugs shall be used.
 - 10). All grounding and bonding connectors shall be listed by a nationally recognized testing laboratory (NRTL) as required by the NEC. Install per manufacturer's guidelines.

B. Telecommunications Main Grounding Busbar (TMGB) & Telecommunications Grounding Busbar (TGB)

- 1. The TMGB & TGB must be a predrilled copper busbar with holes for use with standard-sized, two-hole lugs, have minimum dimensions of 6.3 mm (0.25") thick by 101 mm (4") wide and shall be a minimum of 508 mm (20") in length.

A. Cable Support (General)

1. The main routing and support systems for communication cables on the UC Davis Healthcampus are:
 - a. Cable tray system (Main pathway down corridors).
 - b. J-hooks and adjustable cable support (bags) (accessible false ceiling areas).
 - c. Conduit home runs (hard ceiling areas, inaccessible ceiling areas, in-floor boxes, masonry walls). The CR standard for a combined system is an overhead distribution method based on the use of a cable tray and J-hook system for routing and an EMT conduit stub-up to theWAO device boxes.
2. All cable trays are to be divided with a metal divider for shared space. 800 MHz radio, Accesscontrol, CCTV, etc. is to have a separate J-hook cable support from the cable tray.

HANGERS AND SUPPORTS FOR COMMUNICATION SYSTEMS

27 05 29

A. Communications J-Hooks

1. J-hooks shall be spaced at a maximum of 48" in the main bundle, 48 to 60" apart in thesecondary bundles and within 6" of an EMT conduit stub-up.
2. Main cable bundle will be made up of 4" saddle bags and supported on a minimum of $\frac{3}{8}$ " threaded rod.
3. Secondary cable bundles will be made of minimum 2" J-hooks with a closer. Support secondarycable bundles with pencil rod. Cable supports shall not exceed 30% fill ratio. Refer to manufacturer's recommendations. Location of J-hooks shall be indicated on the Electrical Design and/or Telecommunications drawings.
4. Cables shall not be secured to the J-hook with cable ties or vinyl tape.
5. Contractor to provide drawings indicating Primary and Secondary pathways to the UniversityRepresentative for approval before installing cable.

CONDUITS & BACKBOXES FOR COMMUNICATION SYSTEMS

27 05 33

A. Installed interior conduits shall

1. Be installed in the most direct and accessible route possible (e.g., parallel to building lines andlocated in and above accessible hallways).
2. Contain no more than two (2) 90-degree bends in any dimensional plane or exceed 100' in length between pulling points or interior pull boxes.
3. A pull box is not to be used in place of a conduit sweep.
4. Stub up to an accessible ceiling area and within 6" of a J-hook or cable tray from a device box.
5. Be reamed at both ends and have a plastic bushing installed on each

end to prevent damageduring cable installation.

6. Have a pull string installed in all conduits with a minimum test rating of 200 lb.
7. All conduits shall be bonded and grounded in accordance with the CEC and ANSI-J-STD-607-B.
8. Interior conduits and/or sleeves shall be properly sized in accordance with TIA/EIA 569-B.
9. Conduit shall be used to route the riser cables between the TR/TS if cable trays are not used to support the horizontal cabling.
10. A 2" conduit shall be dedicated from the TR/TS to a sealed junction box on the roof of the building for the installation of an 800 MHz antenna cable. This conduit shall be grounded using a path other than the telecommunications ground provided in the TR/TS.

CABLE TRAYS FOR COMMUNICATION SYSTEMS

27 05 36

- A. Cable Runway shall be
 1. Used only in Telecommunications Spaces (TS).
 2. Secured on 5' centers overhead using a standard trapeze type support system with 1/2" threaded rod in accordance with manufacturer specifications and applicable CBC and CECCodes.
 3. Cable tray shall not to be attached to the walls, secure overhead to a single plane.
 4. UL Classified, gold zinc plated and minimum 18" wide with 9" rung spacing.
 5. Installed with a minimum clearance of 12" above the cable ladder.
 6. Meet the current requirements in TIA/EIA 569-B.
 7. Grounded and bonded in accordance with ANSI/TIA/EIA-J-STD-607-B. All splices, T-Sections and bends shall be bonded together. Cable runway and trays shall not be used as an equipment ground nor seismic support or bracing.
 8. Meet Zone 4 or higher seismic bracing standards.
- B. Cable Trays
 1. Shall be steel wire basket or mesh suitable for hallways and false ceiling areas.
 2. That are used to support horizontal cabling may be used to support riser cables provided the cable tray's carrying capacity can accommodate the riser cables.
 3. Shall be a minimum of 18" wide and 2" deep and contain a metal divider with 4" sectioned off for security low voltage.
- C. Cable Tray and Runway Clearances
 1. Cable trays shall not be placed within 5" of any overhead light fixture and within 12" of any electrical ballast.
 2. A minimum clearance of 12" above and 12-18" to one side of the cable

tray shall be maintained at all times. All bends and T-joints in the cable trays shall be fully accessible from above (within 1').

3. Cable trays shall be mounted no higher than 12' above the finished floor and shall not extend more than 4' over a fixed ceiling area.

All cable trays and ladder racking, equipment racks and cabinets shall have seismic bracing as designed by a California Licensed Structural Engineer.

UNDERGROUND DUCTS & RACEWAYS FOR COMMUNICATION SYSTEMS 27 05 43

- A. Conduit Routes will be specified by Communications Resources.
- B. Underground Conduit Construction

1. General

- a. Conduit shall be Polyvinyl-Chloride (PVC) Schedule 40 or 80 (dependent upon concrete encasement requirements), corrosion-resistant plastic with a 4-inch inside diameter for underground installations and Galvanized Rigid Steel (GRS) or PVC Externally Coated

GRS for riser applications.

- b. Spacers shall be used in the trench to support the conduits.
- c. A solid core #10 AWG copper wire shall be installed externally along any conduit run for the purpose of locating and tracing the conduit route.
- d. Fabric multi-cell type of innerduct shall be considered for conduits planned for fiber optic cable installations.
- e. All installed conduits shall be cleaned and verified with a flexible mandrel and a stiff brush. Mandrels shall be 12" in length and sized to within 1/4 inch of the inside diameter of the conduit.
- f. All conduits shall be provided with mule tape with a minimum of 200 pound pulling tension.
- g. All unused entrance conduits shall be capped/plugged with expandable type duct plugs.
- h. Conduit stubs entering the building shall extend beyond the foundation and landscaping to prevent shearing of the conduit and allow for access. Conduit entering from a below grade point shall extend 4" above the finished floor in the TR/TS. Conduit entering from ceiling height shall terminate 4" below the finished ceiling.
- i. All future conduit stubs shall be flagged for easy identification and a 3M® electronic ball marker shall be placed.
- j. All metallic conduit and sleeves shall be reamed, bushed and capped when placed.
- k. The minimum depth of a trench shall allow for 24" of cover from the top of the conduit/cable to final grade. Warning tape containing metallic tracings shall be placed a minimum of 18" above the underground conduit/duct structure and direct-buried cable to

- minimize any chance of an accidental dig-up. Both ends of the metallic warning tape shall be accessible after installation.
- l. Manholes (MHs) and Pull Boxes (PBs) more than 30" below grade shall be equipped with permanent fixed steps or a fixed ladder.
 - m. There shall not be more than the equivalent of two (2) 90-degree bends (180 degrees total) between pull points, including offsets and kicks. Back-to-back 90-degree bends shall be avoided. All bends shall be manufactured long sweeping bends with a radius not less than 6 times the internal diameter of conduits 2" or smaller or ten (10) times the internal diameter of conduits larger than 2". Bends made manually shall not reduce the internal diameter of the conduit. All branch conduits exiting a MH/PB shall be designed as Subsidiary conduits only (exit from the end wall of the MH/PB, not from the side wall). Lateral conduits entering/exiting MH/PB's are not allowed. The lowest conduit knockouts shall be used first when adding new conduit to a MH/PB.
 - n. The University Representative will observe and inspect utilities trenching, excavation, backfilling, and compaction as appropriate. Design should include contractor instructions to schedule all inspections prior to commencing trenching and backfilling operations. All installations are subject to satisfactory inspection by the University Representative.
 - o. Conduits shall be secured with rebar, or equal when covering conduits with concrete.
 - p. All conduit bends and sweeps shall be concrete encased to prevent movement and "burn-through" by the pull rope during cable installations.
 - q. Concrete encasement shall comply with State of California, Department of Transportation standard specifications.
 - r. An orange-colored additive shall be raked or trowel-worked into the wet concrete or cement slurry to identify the duct structure as communications.
 - s. Reinforcing bars within the concrete shall be used at any location subject to extreme stress. Reinforcing bars within the concrete shall be sized accordingly for the load and stress at each location.
 - t. Inspect and approve all conduits prior to encasement.
 - u. Conduit shall be encased in concrete or cement slurry when the following conditions exist: 7). Minimum conduit depth cannot be attained.
 - 8). Conduits pass under sidewalks, roadways, driveways, railroad tracks and at bendpoints.
2. Directional Boring
 - a. High-density polyethylene (HDPE) conduit to be used for directional boring.
 - b. A swivel shall always be used to prevent rotation of the product pipe.

3. Sizing Underground Conduit

- a. The quantity and size of underground entrance conduits are based on the size of the building: Three (3) 4" conduits are standard. Minimum of four (4) 4" conduits are recommended down main pathways.

UTILITY POLES FOR COMMUNICATION SYSTEMS

27 05 46

All UC Davis Health campus utilities are to be placed underground.

IDENTIFICATION OF COMMUNICATION SYSTEMS

27 05 53

- A. Labeling shall meet the requirements in this document and the ANSI/TIA/EIA 606-B, Administration Standard for the Telecommunications Infrastructure of Commercial Buildings, where applicable.
- B. NAM Numbering, Matrix and Labeling Requirements
 1. NAM Numbering
 - a. Assign the NAM numbers to the floor plans. Contact the University Representative to obtain blocks of NAM numbers for voice, data and fiber to the desktop (FTTD) and master antenna television (MATV). The University Representative will coordinate the information with the CR Project Engineer.
- C. NAM Matrices
 1. The consultant shall provide a NAM Matrix spread sheet (Data, MATV and FTTD), which identifies all NAM locations, TR and cross-connects.
 2. Specify that the contractor shall use and update the NAM Matrices during the project construction.
- D. Outside Plant and Riser Cable Labeling Requirements
- E. Fiber Optic Cable Termination Cabinet/Housing Labeling
 1. Fiber optic termination housings shall be labeled using the manufacturer's provided termination-housing labeling system. The panel shall be overlaid with one-piece, self-adhesive, full-size, laser printer generated label sheet adhered to the slide out metal panel or inside door of the enclosure, where applicable using an 8.5"x11" laser printable adhesive backed sheet, part number Avery 5165 or equal.
 2. Fiber strand numbering shall be consistent with the Consecutive Fiber Numbering (CFN) sequence as identified in TIA/EIA 568-C.1. This fiber stand numbering sequence shall be accomplished at each terminated end of the fiber optic cable. The rolling of fiber optic strands, as identified in TIA/EIA 568-C.1 as Reverse Pair Positioning (RPP) shall not be used on the UC Davis Health campus.
- F. Fiber Optic Housings Connector Panels Labeling
 1. Fiber strand number 1 (Blue) shall occupy fiber port number 1 in the upper most left position of the first duplex bulkhead connector installed

in the connector panel placed in the first slot on the left side of the housing.

2. Fiber strand number 2 (Orange) shall occupy fiber port number 2, immediate right of fiber port number 1, of the same duplex bulkhead connector.
3. All remaining fiber optic strands shall be number consecutively left to right, top to bottom.

G. Fiber Optic Splice Shelf Labeling

1. Fiber optic splice shelves and drawers shall be labeled sequentially from top to bottom using an adhesive backed, labeling stock type of paper printed on a laser printer. Trim the paper to fit the inside door of the splice housing or shelf.
2. Identify in tabular form the splice tray, position number and the fiber strand spliced at that location. Labeling shall consist of the cable number, the fiber optic strand number, and the strand type.

H. Fiber Optic Cable Sheath Labeling

1. Label Fiber optic cable sheaths located inside buildings within 12" of the fiber housing, the point at which the cable enters and/or exits the room and at one mid-point location when the cable is installed in a cable tray or ladder rack, as a minimum.
2. Fiber optic cables located in maintenance holes (MH) shall have their sheaths labeled in at least one location that is visible from grade level. MH's and PB's containing splice closures shall be labeled on each side of the splice closure. Outside Plant (OSP) fiber optic cables shall contain an orange fiber optic warning tag with large black letters. Panduit type PCV-FOR, or equal.
3. The fiber optic cable label shall consist of a plastic yellow and black type tag with a self-laminating cover for use with pre-printed labels and attaches with a plastic tie wrap. Panduit type PST-FO, or equal.

I. Copper Cable Termination Housing Labeling

1. Building entrance terminals shall be labeled with the name of the building, the building zone number, the building CAAN number, the cable pair numbers entering the terminal and the cable pair numbers exiting the terminal (if applicable).
2. Labels shall be pre-printed using an electronic label maker such as the Brother P-Touch® or equal, or a laser printer. Electronic label maker labels shall be 18 point, "font 1" black block letters on a white background. Desktop printed labels shall be black, Arial, 10-point font, block letters on a white background.

J. Copper Cable Sheath Labeling

1. Copper cables located inside buildings shall have their sheaths labeled within 12" of the termination housing, the point at which the cable enters and/or exits the room and at one mid-point location when the cable is installed in cable tray or ladder rack, as a minimum.
2. Copper cables located in maintenance holes (MH) and pull boxes (PB) shall have their sheaths labeled in at least one location that is visible

from grade level. Existing MH's and PB's containing splice closures shall be labeled on each side of the splice closure and shall be visible from grade level.

3. The copper cable label shall consist of a gray plastic type tag with a write-on surface attached with a plastic tie wrap. Panduit type CM4S-L8 is the preferred and recommended manufacturer, or equal.

COMMISSIONING OF COMMUNICATIONS

27 08 00

A. Testing Requirements for Copper and Fiber Optic Horizontal Cables

1. General

- a. Test and document each horizontal cable segment separately.
 - b. Test each end-to-end cable link.
 - c. Designer will communicate testing specifications and requirements.
2. The installation contractor shall perform testing on all installed cabling systems. All documented test results shall be provided to the Communications Resources (CR) representative for review and approval.
 3. Prior to testing, all cables shall be installed, terminated, labeled and inspected. The contractor shall notify the CR representative 48 hours in advance and provide a testing schedule. The University Representative and/or the CR representative has the right to verify the set-up and procedures of testing instruments and be present during cable certification. The contractor shall provide calibration certifications for testing equipment to be used, prior to commencement of testing. All testers are to have been calibrated within the last year of testing. All tests conducted before approval will be null and voided.

B. (UTP) Unshielded Twisted Pair Horizontal Voice and Data Cable Testing

1. Permanent Link test all UTP horizontal station cables with a Level III or later tester for full compliance with TIA/EIA 568-C.2, Category 6A specifications. Test using Cat 6A test cords, by same manufacturer as test equipment and save all graphs when testing. Contractor to test 110 voice terminal blocks with a 110 smart adapter probe test cord provided by the manufacturer of the test equipment.

STRUCTURED CABLING

27 10 00

Communications Resources shall be consulted early during the utilities planning phase of the project since each site may have technical requirements requiring a modification of these specifications.

COMMUNICATIONS ENTRANCE PROTECTION

27 11 13

A. Building Entrance Terminals

1. Outside Plant copper cables entering the TR shall be terminated on

wall-mounted building entrance protector terminal(s) equipped with digital solid-state protector modules.

2. Building entrance terminals shall not be located directly above the room entrance conduits, slots or sleeves. Terminals shall be mounted in a location on the backboard that shall allow sufficient space for future cable and cross-connect installations.
3. Copper entrance cables up to and including 300 pairs shall be terminated on protected building entrance terminals equipped with a splice chamber and factory installed large 710-type splice modules in the splice chamber (field side) and 110 type terminations on the output (equipment side) and lockable cover. Cable shall be blocked with an approved manufactured seal to prevent the gel filled compound from escaping.
4. Copper entrance cables 301 pairs and larger shall be terminated on individual 100 pair

protected terminals equipped with a factory installed, 26AWG swivel cable stub in the splice chamber (field side) and on the output (equipment side): stub-in, stub-out configuration. Cable stubs shall be no shorter than 2 feet in length after installation.

5. Factory cable stubs shall be spliced with 25-pair 710-type splice modules to the outside plant copper. An indoor rated splice closure shall be securely mounted to the plywood backboard. Indoor closures shall not be encapsulated.
6. Contractor is required to extend the copper backbone cable from the building entrance terminal to a separate 110-type termination block field.

COMMUNICATIONS CABINETS, RACKS, FRAMES & ENCLOSURES 27 11 16

- A. Free standing equipment racks shall be used in all TR/TS locations that are secured by a CR lockable door.
- B. Equipment racks shall meet the following requirements:
 1. One (1) piece 10-gauge welded steel. Nominal height is 7' (45U) by 27" wide. Fits 19" rackmount equipment. Rails must be double sided and tapped on both sides with 12 -24 UNC threads in EIA Universal 5/8 - 5/8 - 1/2" vertical mounting hole pattern that matches industry standards.
 2. UL 1863 Tested / Listed to 2,500 lbs. static load - max safety factor of 4 - tested to 10,000 lbs. Proof of conformance must be supplied with submittal prior to work.
 3. Ground holes provided in multiple locations in accordance with BICSI guidelines. Ground symbol pressed into metal as required by CEC (California Electric Code).

Table 1 Equipment Rack and Cabinet Dimensions

Type of Termination	Equipment Rack Dimensions (H x W)	Distribution Cabinet Dimensions (H □ W □ D)
---------------------	-----------------------------------	---

TR	84" □ 19" (3 each)	84" □ 24" □ 32" (3 each)
TS	84" □ 19" (5 each)	84" □ 24" □ 32" (5 each)

Note: Overall height of all standing equipment racks and cabinets shall not exceed 84 inches.

Figure 4 Typical TR/TS Equipment Rack Layout:

Figure 5 Typical TR/TS Equipment Rack Layout:

COMMUNICATIONS TERMINATION BLOCKS AND PATCH PANELS

27 11 19

- A. Data Patch Panels
 1. UTP cable patch panels that provide data service to WAO's shall meet the following specifications, Ortronics® Clarity 10G Angled, Part number OR-PHA6AU48 (48 port), or equal.
 2. Patch panels shall be manufactured by an ISO 9001 Certified Manufacturer and be fully compliant with ISO/IEC/DIS-11801 standard and meet FCC specifications where applicable. These products shall also be UL® certified, where applicable.
- B. UC Davis Health has adopted a Universal Wiring Scheme. All Work Area Outlets (WAO) consist of data service. WAO UTP cabling shall be terminated on a Cat 6A patch panel mounted within the patch panel equipment rack located within the Telecom Room.
- C. Voice Backbone UTP Cable Termination Blocks
 1. Voice backbone UTP cables that provides voice service to WAO's, cross-connects and DigitalLoop Carrier systems shall be installed using the following products.

- a. Wall-mountable 110-type cross connect termination blocks with backboard shall support the appropriate Category 5e rating. Manufactured in 300 pair size kits to include 110-type blocks, 110-C type connecting blocks, jumper trough, bottom tray and labels. Termination kit shall be Ortronics □ PT# 110-PA2-300FT, Systimax □ or equal.
- b. Wall-mountable 110-type cross connect field shall facilitate cross connection and/or intermediate cross connection using 110 wall mount backboard channel and cross-connect wire or patch cords. The cross-connect hardware shall be of the same manufacturer as the 110-type patch panel to ensure compatibility, function, fit and appearance.
2. The top of the 110-type block shall be mounted on a plywood backboard at a maximum height of 72" Above Finished Floor (AFF).
- D. Fiber to the Desktop (FTTD) Patch Panels
 1. FTTD patch panels that provide fiber service to WAO's shall be terminated using the following products.
 - a. Corning Cable Systems® Pretium Connector Housings, Rack-mountable, PCH or equal.
 - b. Corning Cable Systems® Pretium Wall-Mountable Housings, PWH or equal. Corning Cable Systems® Closet Connector Housing Panels, CCH-CP12-A9, Single-mode LC Adapter Duplex, or equal
 - c. Corning Cable Systems Unicam® Single-mode LC Ultra Polish connector, Part number 98-200-98, or equal. Corning Cable Systems factory made SM LC Ultra PC type pigtails, or equal.
 2. All rack- and wall-mounted fiber optic closet connector housings shall be labeled in accordance with UC Davis Health's current standards.
 3. Housing and connector panels shall be of the same manufacturer as the fiber optic cable and connectors to ensure proper compatibility, fit, function, appearance and the highest campus wide system performance levels and warranty.

COMMUNICATIONS BACKBONE CABLING 27 13 00

Refer to specification section for complete detail.

COMMUNICATIONS COPPER BACKBONE CABLING 27 13 13

- A. Building Backbone Inside Plant UTP Copper Cable
 1. The building backbone consists of the riser cable and the supporting infrastructure within a building or cluster of buildings that connects the Telecommunications Spaces TS/TR. The building backbone shall be arranged in a Star Topology.

COMMUNICATIONS COPPER CABLE SPLICING & TERMINATIONS 27 13 13.13

A. Splicing Methods and Splice Closures

1. Copper Cable Splice Methods

- a. Copper telephone cables shall be spliced using a 710-type, 25-pair, large size, gray in color connector (710SC1-25, 710SD1-25, and 710TC1-25) for underground, direct-buried, aerial and building terminal splices. 710-type connectors shall be 3M-type or equal.
- b. All splices shall be accomplished using the conductor fold-back method to ease future splicing and maintenance efforts.

2. Copper Cable Splice Closures

- a. Copper cable splices (Aerial, Underground, and Direct-buried) shall be sealed using a bolt together, washer-less, stainless-steel type of closure with field adaptable/drillable/reusable 1, 2 and 3 section end plates to match the existing cable plant. Closure shall be Preformed Line Products® (PLP) or equal. No known equal.
- b. The closure shall be sized to allow sufficient interior space for the fold-back method of splicing and to allow for the addition of future bridge spliced cables.
- c. The closure shall be air pressure tested (flash-tested) upon installation and shall not be filled with encapsulant.
- d. All splice closures shall be properly supported, racked and lashed to the MH racks. Closures shall be supported by their own individual cable steps, in addition to the steps used to support the cable itself.
- e. All splice closures shall be properly grounded to the MH grounding and bonding system.
- f. All splices shall be inspected by the University Representative prior to the completion and sealing of the splice.

COMMUNICATIONS OPTICAL FIBER BACKBONE CABLING

27 13 23

A. Fiber Optic Riser Cable

1. Riser cables shall meet the following requirements:

- a. Conform to CEC Article 770 and comply with the State of California fire codes as interpreted by the Campus Fire Marshal's office.
- b. The type of riser cable shall be UL listed OFNR/OFNP rated as required.
- c. The cable shall be of the same manufacturer as the fiber optic termination equipment to ensure fit, function, system compatibility, performance, and warranty.

B. Outside Plant Fiber Optic cable

- 1. Loose Tube dry cable with water blocking technology cable by use of a water-swallowable tape shall be used for underground installations. For outside plant applications, provide Corning Freedom® Loose tube fiber optic cable, or equal See manufacturer for construction

specifications.

C. Dielectric OSP Fiber Optic Cable

1. Note: Indoor/outdoor rated cable shall be installed in those locations where the indoor exposed cable distance from the entry point to the termination or splice location exceeds 50'.
2. Minimum bend radius shall be maintained during and after the installation phase. The minimum bend radius during installation is 15 times the outside diameter of the cable and 10 times the outside diameter after installation.
3. Buffer tube fan out kits shall be used per manufacturer's requirements.
4. The recommended minimum number of fiber strands for each type of Telecommunication Space is shown in Table 17.
5. Fiber optic cable shall have a 30' service loop prior to terminations at the ADF/BDF/IDF location. CR shall approve the location of this service loop prior to cable installation and termination. OSP fiber shall have a 50' service loop left in each Manhole/pull box. This slack shall be properly stored and lashed to the MH racks and shall not interfere with existing cables and splice closures.

Table 16 Single-Mode Cable Specifications

SINGLE-MODE FIBER OPTIC CABLE DESCRIPTION	SPECIFICATION
Maximum Attenuation: (dB/km)	0.4 @ 1310nm
	0.3 @ 1550nm
Gigabit Ethernet Distance Guarantee: (meter)	5000 @ 1310nm
Temperatures: (Operation)	-40 to +70°C (-40 to +158°F) All Dielectric
	-40 to +70°C (-40 to +167°F) Armored
Maximum Tensile Load: Short Term	2700N (600 lbf)
Long Term:	890N (200 lbf) ALTOS® 600N (135 lbf) FREEDM®
Approvals and Listings	RUS 7 CFR 1755.900
Design and Test Criteria	ANSI/ICEA S-87-640 (ALTOS®), ANSI/ICEA S-104-696 (FREEDM®)
NEC Listing	Article 770
Manufacturer:	Corning Cable Systems □ ALTOS®, FREEDM®, or equal.

Table 17 Recommended Size of OSP Fiber Optic Cable for Building Distribution

TYPE OF TELECOMMUNICATIONS SPACE	NUMBER OF FIBER STRANDS REQUIRED
TR	144 strands SM
TS	72 strands SM

COMMUNICATIONS OPTICAL FIBER SLICING AND TERMINATIONS 27 13 23.13

A. Fiber Optic Cable Splice Methods

1. Confer with the University Representative when designing the outside plant cable layout.
2. Should a field splice be required, single-mode OSP fiber cables shall be fusion spliced only. Mechanical splices shall not be allowed. Heat shrink type fusion protectors with a strength member shall be used for all fusion splices.
3. The larger 24-strand 13" size splice trays shall be used for single-mode splices to allow additional space for retaining fiber loops and controlling bend radius.
4. All splices shall be inspected by the University Representative prior to sealing the splice.

B. Fiber Optic Splice Closures

1. Fiber optic cable splices shall be sealed using a hard plastic, bolt together, re-useable/re-sealable type of fiber optic cable closure.
2. Closure shall allow manufacturer's recommended slack (typically 8'-10') within the closure to facilitate present and future fiber splicing and maintenance activities.
3. All splice closures shall be properly supported, racked and lashed to the MH racks. Closures shall be supported by their own individual cable steps, in addition to the steps used to support the cable itself.
4. All splice closures shall be properly grounded to the MH grounding system, when applicable.

C. Fiber Optic Connectors

1. Fiber optic cable for outside plant and riser/backbone installations shall be fusion spliced to factory made 568SC Ultra PC Polish type pigtails at the TR/TS.

COMMUNICATIONS COAXIAL BACKBONE CABLING 27 13 33

Reference MASTER ANTENNA TELEVISION (MATV) SYSTEM Specification Section 27 43 00.

COMMUNICATIONS HORIZONTAL CABLING 27 15 00

- A. UC Davis Health recognizes two types of cables for use in the horizontal segment: Unshielded Twisted Pair (UTP) and single-mode

(SM) fiber optic cable.

1. UTP cable shall be 4-pair, 23 AWG, solid conductor UL Listed Type CMP (plenum) or OFNP (Optical Fiber Nonconductive Riser) cabling that meets ANSI/TIA/EIA 568-C.2 (6A) cable, to include any/all current Addendums and Bulletins and shall meet specified specifications and

performance requirements.

2. Fiber optic cable shall be a minimum of 4-strands, single-mode, 8.3/125 μ m, tight-buffered, indoor cable and meet or exceed OFN-FT6 requirements.
- B. All conductive cable, fiber optic, radio and television, community antenna and network-powered broadband communications systems and associated components shall comply with the most current edition at the time of design.
- C. Horizontal cables shall not be spliced, nor will these cables contain manufacturer splices.
- D. The maximum total length of horizontal cable from the IDF to WAO not to exceed 295'; 328' (100 meters) including patch cords (equipment and workstation).
- E. Cable slack shall be provided at the workstation to accommodate future cabling system changes.
1. The minimum amount of slack shall be 6" for UTP cables and 36" for fiber optic cables at the WAO.
 2. Service loops are not recommended in copper cable installation practices.

COMMUNICATIONS OPTICAL FIBER HORIZONTAL CABLING 27 15 23

WAO's providing fiber to the desktop (FTTD) service shall be cabled using riser or plenum rated single-mode fiber optic cable.

COMMUNICATIONS COAXIAL HORIZONTAL CABLING 27 15 33

- A. UC Davis Health recognizes the following types of cables for use in interbuilding horizontal segment of an MATV system: Quad-shield RG6 and RG11.
1. Cables installed shall be UL listed type CMP and comply with CEC 800-51(a). The UL listings shall be marked on the cable sheath.
 2. Coaxial cables installed in buildings must meet the same code requirements as telecommunications cables. All conductive cabling and associated components shall comply with Article 800 of the CEC.
 3. Reference Division 27 43 00 Master Antennae Television (MATV) System for more information.

COMMUNICATIONS FACEPLATES & CONNECTORS 27 15 43

- A. The Network Access Module (NAM) is the actual connector or jack installed

- in a faceplate or surfacemounted box upon which the UTP, coax and fiber optic cable is terminated on in the work area.
- B. The term Work Area Outlet (WAO) refers to the actual faceplate or surface mounted box installed in the work area.
 - C. Work Area Outlet (WAO) Faceplates, Surface Mount Boxes, WAO Mold Adapter and Modules
 - D. Faceplates, Surface Mount Interface Boxes and 106-Type Receptacles:
 - E. Termination Hardware Requirements at the NAM WAO
 - F. Termination Hardware Requirements at the Fiber WAO
 - G. Each fiber optic cable shall be terminated at the WAO using a Small Form Factor LC style connector mounted in an LC type faceplate module. Reference Table 21 for module specifications.
 - H. Termination hardware requirements at the MATV WAO
 - I. Terminate each coax cable at the MATV WAO with an F-type connector, 180-degree exit, 75-ohm module. The F-type connector module shall match the color and appearance of the faceplate. Reference Table 21 for recommended part number and minimum performance specifications. Ortronics TracJack, or equal.
 - J. Install 75Ohm terminator resistors at all unused system terminal points.

COMMUNICATIONS CONNECTING CORDS, DEVICES & ADAPTERS 27 16 00

Cords and Electronic Devices are provided by UC Davis Health.

COMMUNICATIONS PATCH CORDS, STATION CORDS AND CROSS CONNECT WIRE

- A. Patch cords shall be from the same manufacturer as the termination hardware to ensure proper compatibility, fit, function, appearance and the highest campus wide system performance levels and warranty.
- B. Patch cords shall be manufactured by a TL 9000 and ISO 9001 Certified Manufacturer and be fully compliant with ISO/IEC/DIS-11801 standard and meet FCC specifications where applicable. These products shall also be UL® certified, where applicable. Field fabricated patch cords shall not be used.
- C. Patch cords shall be of the same or higher transmission category as the cable system installed.
- D. Data Patch Cords Provided by UC Davis Health.
- E. Voice Cross-Connect Wire
 - 1. Proper selection and installation of cross-connect jumper wire used between cross-connect blocks is essential to the overall performance of the network. The twist shall be maintained to within 1/2" of the entry into the cross-connect block.
 - 2. Contractors shall complete the horizontal and riser cross-connections at the TR/TS location(s). Contractor shall provide sufficient jumper wire

(white/blue, 24AWG for voice, white/red, 24 AWG for Fire Systems) to complete all identified cross-connects at the IDF locations.

- F. Fiber Optic Patch Cords provided by UC Davis Health.

DATA COMMUNICATIONS 27 20 00

All electronics provided and installed by UC Davis Health.

DATA COMMUNICATIONS WIRELESS ACCESS POINTS 27 21 33

A. Wireless Access Coverage

1. Contact the University Representative for specifications for the placement of wireless accessNAM locations.
2. For New Construction projects, it is the responsibility of the A/E consultant to provide wireless and heat maps for the placement of Wireless Access NAM locations. It is mandatory to provide 100% wireless building coverage in 2.4 GHz and 5 GHz spectrums in all designs. Wireless NAM locations shall be cabled using a square cell topology. Provision for a Wireless NAM location every 30-feet (900ft²). Provision for one Wireless Access Point (WAP) in areas of congregation (lecture rooms, classrooms, large conference rooms, auditoriums, etc.) for every 20 people (50-60 devices) based on occupancy rate of the area.

B. Wireless Access NAM

1. Wireless access NAM consists of two (2) data Network Access Modules (NAM). The wirelessNAM is to be terminated with an 8-position, 8 conductor module and placed into a 2-port surface mount box.
2. Location of the wireless NAM is based on the room design:
 - a. Standard ceiling height rooms (offices, classrooms, conference rooms, etc.) with drop tile ceiling: leave the NAMs, placed within a 2-port surface mount box, concealed above the drop tile ceiling with a minimum of 10' of slack. Place the NAMs where it will provide the greatest amount of useable coverage.
 - b. High ceiling rooms (lecture rooms, auditoriums, etc.): depending on the size of the room, provision for two NAM locations on each side wall at approximately 8'-6" AFF. Install each NAM location with a 4-11/16" square back box flush in the wall with a double gang ring and faceplate.
3. Wireless network equipment shall be provided and installed by UC Davis Health.

VOICE COMMUNICATIONS 27 30 00

All wall phones emergency call boxes and towers approved by the University Representative shall be installed in accordance with CBC accessibility requirements.

VOICE COMMUNICATIONS TERMINAL EQUIPMENT 27 32 00

- A. Courtesy, Text, Area of Refuge, Emergency and Wheelchair Lift and Elevator Telephones shall comply with the American Disabilities Act (ADA) Accessibility Guidelines.
 - 1. Wall telephones shall not be installed above or over Laboratory countertops. A standard desktop telephone may be installed in these unique locations.

TELEPHONE SETS

27 32 13

- A. Indoor Wall-Mounted Telephone
 - 1. A 4-11/16" x 21/8" deep square electrical back box with a single gang plaster ring shall be provided. A minimum 1" EMT conduit shall be installed to the cable pathway support system. Place the voice NAM into a single port wall phone plate. A 5 square by 2-7/8" deep device box with a single gang mud ring installed flush mounted within the wall. A minimum 1 -1/4" conduit shall be installed to the cable pathway support system.
 - 2. Provided a 12" square clear area around the outlet for the wall phone to be mounted unobstructed.

ELEVATOR TELEPHONES

27 32 23

Each elevator bay, including elevator chair lifts, is required to have a dedicated phone line. A minimum of one Data NAM shall be installed for each elevator bay (including wheelchair lift and elevator) in an accessible area outside and near the Elevator Control Room. The NAM is to be placed within a Hoffman 8"x6"x4" indoor rated box with a hinged cover, or equal. A conduit will need to be provided from the box to the elevator room control panel.

RING-DOWN EMERGENCY TELEPHONES

27 32 26

Ring Down Emergency Telephones are no longer to be provided in UC Davis Health projects.

TTY EQUIPMENT

27 32 36

Payphones are no longer to be provided in UC Davis Health projects.

AUDIO-VIDEO SYSTEMS

27 41 00

- A. The Design Process
 - 1. UC Davis Health's Audio-Visual (A/V) systems designed and installed in new facilities shall consist of one (1) or more of the following three (3) basic elements:
 - a. Sound System - A complete sound system meeting the

performance standards specified below to be complimented with an ADA-approved assisted listening system.

- b. Video System - A complete video system consists of various display devices consistent with the intended use of the room and viewable from at least 80% of the room while meeting performance standards listed below.
- c. Remote Control Systems - A microprocessor controlled audio-visual system provides for the remote control of the various media systems installed in a room. These systems shall follow the standards established by the Classroom committee's selection of the Smart

Panel or equal, which enables a complete room display without extensive operations training.

B. Performance Standards

1. All A/V systems shall meet, as a minimum, the following performance standards unless

restricted by the published specifications of a specific piece of manufacturer's equipment.

C. Audio Signal

1. Signal-to-Noise Ratio (including cross talk): 55 dB minimum.
2. Total Harmonic Distortion: 0.1% maximum from 20 Hz to 20,000 Hz.
3. Frequency Response: +/- -1.0 dB, 20 Hz to 20,000 Hz.

D. Audio Reproduction

1. Signal-to-Noise Ratio (including cross talk): 55 dB minimum.
2. Total Harmonic Distortion: 1% maximum from 30 Hz to 15,000 Hz.
3. Sound Output Capability: Provide program levels of not less than 95 dB in the seating area without objectionable distortion, rattle or buzz. Several different samples, such as recorded music and microphones, shall be employed as test signals.
4. Hum and Noise: Hum and noise shall be inaudible (below the background noise level of the space) under normal operation and as observed in normal seat locations.

E. Video Signal

1. Signal-to-noise Ratio (peak to RMS) un-weighted DC to 4.2 MHz: 55 dB minimum.
2. Cross talk: Cross talk (un-weighted DC to 4.2 MHz): 45 dB minimum.
3. Frequency Response: +/- 0.5 dB to 4.2 MHz.
4. Line and Field Tilt: 2% minimum.
5. Differential Gain: 3% maximum.
6. Differential Phase: 2-degree maximum.

F. Video Timing:

1. System Timing: Synchronize coincidence within 50 nanoseconds.
2. Color Timing: Within 2 degrees at 3.58 MHz.

G. Optical

01 - General Requirements

1. The light fall-off from the center of the projected image to all four corners, as measured at the projected image plane, shall not exceed 50% for video projector images and 35% from slide projector images.
 2. Fixed projectors, lenses and cameras shall be solidly mounted and braced so there shall be no observable movement in the image induced by motor vibration or other mechanical operations.
- H. Control System
1. Correct functional operation for all specified controls.
 2. Feedback of the active function at operator and wired remote stations.
 3. Wireless systems neither shall be the source of, nor be affected by, radio-frequency interference to and from any external signal devices.

INTEGRATED AUDIO-VIDEO SYSTEMS & EQUIPMENT

27 41 16

- A. Multimedia/Learning Spaces Standards
1. Lighting: General Follow IESNA recommendations. Refer to Division 26 Design Guidelines.
 2. Provide common ground for all A/V power outlet boxes.
 3. Conduit and Backboxes Requirements
 - a. Several conduits shall be installed in the wall from the A/V Smart Panel located behind the wall mounted or roll up A/V Media Cabinet and/or instructor workstation/desk to:
 - 1). Projector location - Minimum of 2" conduit. Conduit must run the entire distance to the projector location. Conduit will not have more than two 90 degree turns within the entire length of the run.

Figure 33 A/V Smart Panel

A/V SMART PANEL

Power Requirements

Two-gang outlet boxes:
4-11/16" square by 2-1/
2" deep box with
double-gang plaster
rings respectively.

Quad outlet power box
will be installed inside
the A/V Smart Panel at
the designated wall
location placement of
the media cabinet.

Data NAM's

Data network NAM's shall be
installed in the following locations:

1. Inside the smart panel
junction box at the designated wall
location placement of the media
cabinet.
2. At each ceiling mounted
projector location. Wherever
possible it will be located within the
drop tile ceiling next to the
projector power outlet and within 2
feet of the projector location.

Conduit Requirements

The preferred method for A/V installation is a
wall mounted media cabinet with all cabling and
conduit being routed thru walls and ceilings.

Several conduits shall be installed from the A/V
Smart Panel located behind the A/V Media
Cabinet to:

- Projector location – Minimum of 2"
conduit. Conduit must run the entire distance to
the projector location.
- Wall speaker locations – Minimum of 1"
conduit to each wall speaker location.
- Ceiling speaker locations – Minimum of
1" conduit. If there is a drop ceiling in the room,
the conduit may be stubbed out above the ceiling
allowing cabling to be run above the ceiling. If it
is a plenum rated ceiling then conduit must run
the entire distance to each ceiling speaker
location.
- Wall mounted assistive listening device
locations – Minimum of 1" conduit to each wall
location.
- Rear wall auxiliary equipment location –
Minimum of 1" conduit to rear wall location.

- B. Projection screen – Minimum 1" conduit to the projection screen location;
the exact location to be designated by the University Representative. Do
not use floor boxes unless preapproved by the University Representative
- C. Media Cabinet are project specific and coordinate with the University Representative.
- D. Assistive listening system required.
- E. Projection Screens and Monitors
 1. Coordinate viewing angles and monitor sizing for seated and instructional positions.
 2. Screen placement is critical to ensure proper viewing angles for
all seats in a room. The following considerations should be
applied to the placement of projection screens.
 - a. Avoid positioning a screen to face uncontrolled light sources such
as windows, skylights, exit signs, etc.
 - b. Screen placements to be centered in the room, offset to the left or
right side of the room or angled in a corner of the room. Exact
placement will be determined by the University Representative.
 - c. Locate projection screen switch near Media Cabinet to ease instructor use.
- F. Data NAM's
 1. Data network NAM's shall be installed in the following locations
 - a. Inside the smart panel junction box at the designated wall
location of the media cabinet and/or instructor workstation/desk.
 - b. At each ceiling mounted projector location, next to the projector power outlet and

within 2"
of the projector location.

- c. On the back wall of the classroom to allow for auxiliary A/V equipment to be installed as needed. The exact location to be designated by the University Representative.

G. Assistive Listening Devices

- 1. All classrooms or lecture halls having 50 or more fixed seats shall have assistive listening devices (ALD's) installed in compliance with CBC.

DISTRIBUTED SYSTEMS (800 MHZ IN-BUILDING RADIO SYSTEMS) 27 53 00

- A. System design shall be determined by the University Representative for antenna locations and coverage areas.
- B. General Radio Communications Coverage
 - 1. All buildings are required to support radio communications from the local public safety entities (Fire, Police, etc.)
- C. Design Requirement
 - 1. 2" minimum conduit shall be dedicated from the equipment/telecommunications room (TS/TR), on the highest building level, to a sealed junction box on the roof of the building for use as an antenna access point. This conduit shall be grounded using a path other than the telecommunications ground provided in the TS/TR.

DIVISION 28 - ELECTRONIC SAFETY & SECURITY
Davis Health

UC

Campus Design Guidelines

ACCESS CONTROL 28 10 00

- A. Access control requirements are determined on a project specific basis. Consult with the University Representative for specific needs.
- B. Access control low-voltage cabling shall be identified in unique cable color and/or labeled in raceway/conduit cable tray.
- C. Coordinate access control system with door hardware, electrified locks and strikes.
- D. Delivery of access control shall provide fully integrated system.

INTRUSION DETECTION 28 31 00

Intrusion detection requirements are determined on a project specific basis. Consult with the University Representative for specific needs.

FIRE DETECTION & ALARM 28 46 00

- A. The basis of design system is Notifier by Honeywell. All systems shall be designed and fully integrated into existing control and reporting panels. All equipment and software shall be by Notifire. Installers must be Notifire certified.
- B. Installers shall provide sequence of operations matrix to be reviewed and approved by the CampusFire Marshal and the University Representative prior to start of work.
- C. No outside consultants (i.e., individuals not employed directly by UC Davis Health) shall have access to fire alarm control panel without direct oversight and review by UC Davis Health's Auxiliary Services Department, a part of IT.
- D. All fire alarm systems low-voltage cable colors shall be red and when run in conduit, all conduit shall be red and labeled as fire alarm system path.

EXCAVATION AND FILL

31 23 00

- A. Geotechnical Requirements
 - 1. Excavation, earthwork and fill shall comply with the requirements of a site-specific geotechnical investigation and report prepared in conformance with Section 1803 of the CBC.
- B. Erosion Control
 - 1. One (1) Acre or More: If the limits of disturbed soil is one (1) acre or more, a Stormwater Pollution Prevention Plan (SWPPP), and Notice of Intent (NOI), shall be prepared and uploaded to the California State Water Resources Control Board's electronic SMARTS system.
 - 2. Less Than One (1) Acre: SWPPPs are not required for projects under one (1) acre, unless they are part of a larger development encompassing over one acre. For projects less than one (1) acre, an Erosion and Sediment Control Plan shall be prepared by or under the direction of and stamped by a Registered Civil Engineer licensed in the State of California. Best Management Practices, BMPs, shall comply with the requirements of the California Stormwater Quality Association (CASQA) and the California Stormwater Best Management Practice (BMP) Handbook, current edition.
- C. Site Clearing
 - 1. Site clearing, if required, shall include removal of all vegetation including trees, stumps and roots to a depth of 36", shrubs, and brush unless designated to be protected in place. Vegetation shall not be burned on site. Clearing of debris including rocks, loose concrete, bricks, wood, metal, junk and garbage, shall be disposed of at an appropriate landfill.
- D. Excavations
 - 1. Excavations, including earthwork and grading, shall comply with the requirements of Section 1804 of the CBC and an approved Geotechnical Report. Grading plans shall be prepared by, or under the

direction of, and stamped by a Registered Civil Engineer licensed in the State of California. Grading Plans shall specify protections for existing adjacent properties and on-site facilities, improvements and trees slated to remain.

2. Excavated soil suitable for re-use shall be stockpiled in an area designated for stockpiling with appropriate erosion and dust control measures. Excess soil or soil unfit for re-use shall be removed from the site.
3. Shoring, if required, shall comply with the requirements of Section V, Chapter 2 of Cal/OSHA and an approved Geotechnical Report.
4. Excavations into the groundwater table will require dewatering in accordance with state and local requirements.

E. Fill

1. Fill shall comply with the requirements of Section 1804 of the CBC and an approved Geotechnical Report. Fill material shall not contain environmental contaminants, asbestos fibers, or construction debris.
2. General Fill: Stripped topsoil or expansive soil material with clay is not suitable in landscape areas (under topsoil) or non-structural areas. General fill shall be free of lumps, rocks, debris and large organic material in accordance with an approved Geotechnical Report.
3. Engineered Fill: Clean, non-expansive (i.e., no clay), well-graded, slightly cohesive soil material usable as structural backfill. Soil characteristics shall be in accordance with the Geotechnical Report including Percent Passing No. 200 Sieve, Liquid Limit (LL), Plasticity Index (PI), and Expansion Index. Engineered fill shall be clean of rocks, debris, and organic large organic material and in accordance with an approved Geotechnical Report.

F. Backfill and Compaction

1. Place and compact fill material in lifts not exceeding 8" unless otherwise specified in an approved Geotechnical Report. Optimum moisture content of fill material shall be maintained in accordance with the requirements of an approved Geotechnical Report.
2. Structures: Subgrade at foundations shall be prepared in accordance with the requirements of the CBC and an approved Geotechnical Report.

TRENCHING AND BACKFILLING

31 23 33

A. Geotechnical Requirements

1. Trenching and backfilling shall comply with the requirements of a site-specific geotechnical investigation and report prepared in conformance with Section 1803 of the CBC.

B. Trenching

1. Trenching into the groundwater table shall require dewatering in accordance with state and local requirements.
2. Trenches deeper than 5' shall be shored in accordance with

Cal/OSHA requirements. Alternatively, the ground above 5' from the bottom of the trench shall be sloped at a ratio of 4(horizontal) to 1 (vertical) or as otherwise specified in an approved Geotechnical Report.

3. Trenching under the dripline of existing trees shall be performed by hand using hand or pneumatic tools only. No tree roots shall be cut unless approved by a certified Arborist.
 4. Maximum allowable open trench is 600 linear feet at any one time. All trenches are to be covered at end of workday. All trench plates must have non-skid epoxy coating.
- C. Backfill and Compaction
1. Comply with the requirements of Section 31 23 00 Excavation and Fill.

LANDSCAPE MAINTENANCE

32 01 90

- A. 90-Day Establishment Period
1. The General Contractor shall be responsible for maintaining the landscape and irrigation work for an additional ninety (90) days beyond certified substantial completion for an establishment period of ninety (90) calendar days. A maintenance schedule shall be submitted with routine maintenance items and a comprehensive schedule. Any landscape work, irrigation repairs or planting material replacements shall occur at no cost to the Owner.

BASES, BALLASTS AND ASPHALT PAVING

32 10 00

- A. Roadway and parking pavement sections are to be designed by a licensed Geotechnical Engineer pursuant to the Traffic Index associated to the roadway or parking lot, in accordance with Caltrans Highway Design Manual, latest edition, for a 20-year life. Materials and installation shall conform to the Caltrans Standard Specifications and Plans, latest edition, unless otherwise required by the University Representative. Traffic signs and pavement markings shall conform to California's Manual on Uniform Traffic Control Devices (MUTCD), latest edition.
- B. Aggregate base material and placement shall comply with the requirements of Caltrans Section 26. Asphalt concrete shall comply with the requirements of Caltrans Section 39. Seal coats shall comply with the requirements of Caltrans Section 37.

CONCRETE PAVING

32 13 13

- A. When the scope of the work is limited to relatively small areas, the guidelines specified in Standard Specification Section 01 73 29 Cutting and Patching shall take precedence.
- B. Mockups are to be requested at the University Representative's discretion.
- C. Mockups are required for site concrete work including individual mockups for each paving finish, seat walls, and stem walls. Build mockups to verify

selections made under sample submittals and to demonstrate aesthetic effects and set quality standards for details and execution.

1. Build minimum of 5'x5' mockups of full-thickness sections of concrete paving.
 2. Site wall mockups shall be a minimum of 5' in length.
 3. Anticipate that up to two (2) samples of each type of concrete may be required to establish accepted colors and finishes.
 4. Cast samples from accepted materials identical to those to be used on site.
 5. Mockups shall demonstrate typical finished edges, joints (including expansion joints with sealant), special design details (reveals, skateboard deterrents, multiple finishes, shiners etc.), surface finishes, texture, and color, curing, and standard of workmanship.
 6. Build mockups where directed by the University Representative and retain onsite until final acceptance or as directed by the University Representative.
 7. Mockups must be approved by the University Representative prior to installation of site concrete. Refabricate samples until accepted. Accepted samples shall serve as standard for subsequent work. Mockups must be completed for review a minimum of calendar days prior to scheduled site concrete installation.
- D. Refer to Drawings section of UC Davis Health's Standard Specifications for typical sidewalk details.
- E. Develop PSI, Max Aggregate and Slump limits with various admixtures.
- F. Exposed Aggregate Sidewalks and Flatwork
1. General Requirements: Application of the following exposed aggregate concrete specification is primarily intended to be used in conjunction with new building construction or extensive hardscape developments where an accepted uniform concrete finish and overall appearance for exterior concrete hardscape is desired. This specification, therefore, applies to the new sidewalks, pathways, courtyards, and plaza areas of and surrounding new buildings on the UC Davis Health campus. Additionally, when existing campus facilities are undergoing renovation and replacement of sidewalks, pathways, courtyards and similar areas, evaluation of utilizing this specification is required.
 2. Scope of Work: Exterior concrete sidewalks, pathways, courtyards, and plazas shall conform to the following design criteria
 - a. Consist of concrete panels with 12"-wide smooth banded perimeter sections surrounding interior sections of exposed aggregate.
 - b. Width, length and spacing of individual concrete panel sections to be a function of the surrounding physical requirements and constraints and shall attempt to incorporate the desired architectural theme.
 3. Materials
 - a. Coarse aggregate: Cache Creek ³/₈" x number 8 pea gravel, (1,650 lbs., 9.94 cubic feet, +/-5% by volume).

- b. Stone color: Red, black, brown and a minor amount of white, evenly distributed. Note: Contractor to coordinate with the University Representative regarding mix and finish. This may require, at the discretion of the University Representative that a sample panel be provided by the Contractor for evaluation and approval by the University Representative.
- c. Reference mix design: Mix Number X8W6041A (Teichert Cache Creek Plant), or equal. Note to Design Professional: A reference site to serve as a control sample for finished appearance of this mix design is present in sidewalks located on the south and west sides of Hunt Hall on the UC Davis Health campus.
- 4. Broom swept, smooth finish sidewalks and flatwork
 - a. General Requirements: Application of the following smooth finish concrete specification is primarily intended to be used at minor walkways. Verify locations with the University Representative.
 - 1). Finish: Medium broom finish swept perpendicular to direction of path.
- 5. Expansion joints in concrete paving
 - a. Expansion joints are to be construction and finished with Silica Sand 20 Mesh from Cascade Rock of Sacramento (or equal) over tooled Sikaflex 2C NS EZ (or equal) over capped with 'zip strip' (or equal) plastic separation cap over 3/8" fiber expansion joint. Silica sand shall be applied liberally and adhered to sealant immediately after installation.

DECOMPOSED GRANITE PAVING 32 15 00

- A. Stabilized 1/4" minus gold DG Paving.
 - 1. Refer to the UC Davis Health standard specification 32 90 00 planting.

TACTILE WARNING SURFACING 32 17 26

- A. Truncated Domes
 - 1. Materials: Concrete dome tiles with integral color and spacing per CBC.
 - 2. Color
 - a. At new locations where all connecting crosswalks are to be new installations, the charcoal/black color shall be selected.
 - b. At locations connecting to existing truncated dome installations to remain, the color shall be selected from the manufacturer's standard colors to match existing.
 - c. Wet set-in mortar bed as standard.

SECURITY GATES AND BARRIERS 32 31 36

Bollards shall be removable unless otherwise approved by the University Representative.

SITE FURNISHINGS

32 33 00

- A. Bicycle Racks
 - 1. Current spec, "lightning bolt" style, Ground Control Varsity series, or equal
 - 2. Placement and Clearance Considerations
- a. Varies to suit site conditions and quantity of bikes to be accommodated. Refer to manufacturer's product information.
- B. Exterior Benches
 - 1. Site furnishings shall have post-mounted embedded footings where possible. All attachment methods shall be submitted to the University Representative for review.
- C. Tree Grate
 - 1. UC Davis Health has identified operational issues in using tree grates on health campus which requires approval on a project-by-project basis. Design Professional shall review with the University Representative.
- D. Trash and litter receptors
 - 1. Strategically design for trash and recycling systems throughout the interior and exterior of the building. Review the design and planned operations with the building occupants, and UC Davis Health's Environmental Services, Environmental Health and Safety, and Sustainability. Delineate the trash/recycling receptors that shall be included in the project and those to be provided by others. Exterior recycle receptors are not required at this time. Design Professional shall coordinate all trash and recycle receptors as required.
- E. Exterior Receptors
 - 1. Outdoor trash receptors shall be provided at building entrances, resting areas, patio areas, eating areas and walkways. Coordination of bin placement shall occur during the Construction Document Phase between the University Representative and Design Professional. Standard exterior receptor is listed below
 - 2. Trash receptor shall be model S-42 as manufactured by Victor Stanley, Inc, Brick House Road, Dunkirk, Maryland, 20754 and distributed by MB Associates, 15408 Doolittle Road, Grass Valley, CA, 95949 or model FR400(R) as manufactured by Wabash Valley, P.O. Box 5, 505 E. Main Street, Silver Lake, IN, 46982 or equal as approved by the University Representative.
 - a. Color: Bronze paint finish.
 - b. Optional raised steel dome is not required.
- F. Picnic Table
 - 1. "Gretchen" GR 45 with Jarrah LF-20 oil finish picnic table with umbrella hole as manufactured by Landscape Forms, Inc, 431 Lawndale Avenue, Kalamazoo, MI, 49048 and distributed by

Dimensions Unlimited, 609 Hearst Avenue, Berkeley, CA, 94710, Ph. (510) 843-6111 or equal (no known equal) to match UC Davis Health standards.

2. Provide spec information for round picnic table similar to those located at the Education Building Scrubs East Cafe.

IRRIGATION

32 84 00

- A. UC Davis Health has developed a Standard Specification, Section 32 84 00 Planting Irrigation. This specification shall be modified by the Design Professional to meet project requirements. An electronic copy is available upon request from the University Representative.
- B. Irrigation design shall meet California Model Water Efficient Landscape Ordinance (MWELO) regulations and meet or exceed CBC minimums
 1. General Notes and Design Requirements
 - a. Design of irrigation systems shall be based on hydrozones and plant requirements. Areas with differing exposures and groups of plants with different water needs shall not be grouped into the same irrigation zone.
 - b. While design of water efficient irrigation systems is recommended, use of drip irrigation may not be approved for certain areas where future disturbance is anticipated (in utility corridors, high-traffic areas etc.). Use of high-efficiency spray systems where appropriate, is encouraged.
 - c. Irrigation stations with low precipitation rate, multi-stream spray heads must not be designed for maximum flow rate. Design to 70% of pipe capacity. Irrigation systems must be designed to match precipitation rates for all spray heads on the same station. Low precipitation rate, multi-stream nozzles have varying precipitation rates that must be considered in design (for example: Hunter MP 1000-3000 Series should not be combined with SR 800 and 815 series).
 2. UC Davis Health has developed a standard specification, section 32 84 00 planting irrigation. The specification shall be modified by the Design Professional to meet project requirements. An electronic copy is available upon request from the University Representative.
 - a. Overhead irrigation shall utilize technology to eliminate geysers occurring when damages occur similar to Toro's X-flow.
 - b. All valves shall have pressure regulation.
 - c. RCV's shall be grouped and manifolded with an isolation valve to allow for ease of maintenance
 - d. RCV assemblies shall be flanked with unions and the drain rock in the box shall be set at an elevation low enough for the entire assembly to easily twist off for cleaning and maintenance.
 - e. Valve box colors shall be green at turf areas, black at mulch areas and concrete in DG areas. Reclaimed ID tags and placards shall be placed on the lids of each box where applicable, but purple boxes are

not acceptable.

- f. Black flow preventers shall be set on concrete pads with a securable cage and a frost blanket shall be provided. An additional wye filter w/ 150 mesh screen shall be incorporated into each assembly.
- g. Booster pumps shall be placed on concrete pads and the entire area shall be secured with fencing or a cage to deter vandalism.
- h. All new mainline systems shall be flow sensed with master valve control.
- i. Exterior Pedestal mount irrigation controllers shall have tamper-proof stainless-steel enclosures with cooling fans and GFCI outlets included and be WaterSense labeled.
- j. QCV's shall have locking covers and be secured with either concrete slurry or a rigid rebar stake.
- k. All rotor irrigation laterals shall be upsized a min of 1x pipe size to allow for future product replacement and to reduce PSI loss. 1" Lateral Min.
- l. Provide irrigation only sub-meters at all new point of connections.

B. Recycled water systems shall conform to the requirements of the California Department of Public Health's Recycled Water Regulations as outlined in the California Code of Regulations, Title 17 "Public Health" and Title 22, Division 4, Chapter 3 "Environmental Health, Water Recycling Criteria".

PLANTING 32 90 00

UC Davis Health has developed a Standard Specification, Section 32 90 00 Planting. The specification shall be modified by the Design Professional to meet project requirements. An electronic copy is available upon request from the University Representative.

LANDSCAPE WORK 32 93 00

A. General Notes and Design Requirements

- 1. Planting design shall carefully consider site microclimate conditions. Plants shall be grouped into zones based on their compatibility with regard to microclimate, water requirements, size etc. Placement of plants and their relationship to the irrigation system components such as spray heads shall be considered during design.
- 2. The exterior of all buildings that adjoin landscape areas must incorporate a maintenance border consisting of a minimum 30" x 3" section of crushed, clean, ¾"-1" rock with a steel header. A sample of rock shall be submitted to the University Representative for approval.
- 3. Where vines are specified, an appropriate support structure must be designed to support vine growth. Smooth walls, columns, and vertical wires are not acceptable as support structures.
- 4. If problems with soil drainage rates or subsurface conditions are anticipated or arise during construction, additional subsurface drainage

in planting areas will be required. Subsurface drains system shall include gravel wrapped 3" or 4" diameter, perforated, schedule 40 PVC drainpipe, and clean out risers.

5. Trees planned within plazas, parking lots, or other paved areas on site where the proposed supporting landscape area is less than 150 sf. must include modular suspended pavement systems such as Silva Cells (Deep Root) or Strata Vault (City Green) or equal. Uncompacted soil volume minimum for each new tree is 750 ft³.
- B. UC Davis Health has developed a Standard Specification, Section 32 90 00 Planting. The specification shall be modified by the Design Professional to meet project requirements. An

electronic copy is available upon request from the University Representative.

1. Tree shade requirements shall meet or exceed Cal-Green or the local governing body
2. ³/₈" pea gravel mulch to be used in rain gardens, detention basins, infiltration areas or bio - filtration planters to deter migration.

UTILITY ORGANIZATION CRITERIA

A. Utility Organization

1. All utilities shall be organized to the greatest extent possible into logical utility corridors in order to maintain code required separation and ease of access. A utility corridor is defined as an area that is accessible by the required maintenance equipment and void of heavy vegetation.
 - a. The utility corridor shall be a minimum of 10 feet wide and be accessible by a backhoe.
 - b. Utility mains shall be located a minimum of 20 feet from any structures. If a 20-foot clearance cannot be achieved, consult with the University Representative. Structural zones of influence shall be considered when placing utilities and determining depth and pipe materials.
2. Utility lines shall be aligned to remain outside of the future drip line of all existing and planned trees when feasible.
3. Utility lines shall maintain 12 inches of clearance from other existing or planned utilities unless in a designed joint trench.

B. Potholing

1. Record drawings and as built plans, when available, shall be reviewed against all survey data so that all potential utilities are shown on the design documents. Utilities shall be potholed that may be exposed during construction, at utility crossings, and at points of connection. Potholing shall be performed during or prior to the design stage of the project regardless of project delivery method.

All utility trenches shall have utility markers and tape for warning and locating purposes.

UTILITY METERS

33 05 33

The utility meters shall be placed on all water services and as applicable for other campus utilities that require metering or monitoring.

WATER DISTRIBUTION

33 11 00

- A. Design velocities shall not exceed 5 ft/s during normal operation and 15 ft/s during fire flows.
- B. Valving at Service Connections shall be the following:
 - 1. <2 inch - Corp stop at main.
 - 2. 2 inch - Gate valve on service at main.
 - 3. >2 inch - Three valve tee.
- C. A building's non-potable water system shall be created by installing a backflow prevention device at a tee, downstream of the domestic water service backflow prevention device.
- D. Where pipes have conflicts or critical crossings with other facilities, a detail or profile shall be shown on the plans. Details shall accurately show any depth transitions or fittings required to make connections. Any deviation in alignment (horizontal or vertical), such as an under-crossing or over-crossing, shall be noted on the plans and contain a detail specific to each location. The detail shall show plan and profile views and include all relevant details, such as modified backfill materials, air vacuum/release valves, fittings, and type of pipe.
- E. Plans shall note the location of all tie-ins and type of shutdown required, i.e. routine, large, or major. Valves shall be numbered per UC Davis Health's valve numbering system, consult with the University Representative for specific requirements.
- F. Large or critical use facilities shall have dual service connections. Services shall be fed from looped water mains. All domestic services shall have a valve immediately ahead of the water meter location. Each structure shall have a dedicated service connection and each service connection shall be metered. Minimum service size is 1 inch.

Service Connections

Service Size	Hot tap permitted	At the main line connection point
<2 inch	Yes	Corporation stop on service line
2 inch	Yes	Gate valve on service line

>2 inch	No*	Three valve tee*
---------	-----	------------------

1. *If main line isolation valves are already present nearby, the University Representative may allow service to be installed with a hot tap with a valve on the service line.
 2. Flexible connections shall be used when connecting to asbestos cement pipe. The domestic water service to the building or facility shall include reduced pressure principal backflow prevention device(s) installed outside and above ground. The device shall be installed downstream of the domestic water meter (between the facility and the meter)
 3. Irrigation services shall be connected to the utility water system. If the irrigation service must be connected to the domestic water system (e.g., for areas not serviced by utility water), it shall include reduced pressure backflow prevention device(s) installed outside and above ground. All tees require three valves and crosses require four valves. A valve may not be required on any leg of a tee or cross if another valve is within 150 feet. All high points require combination air/vacuum release valve.
- G. Provide number of restraints and pipe length per manufacturer's table at changes in pipe direction, changes in pipe sizes, dead end stops and at valves. New installations shall use restrained joint fittings. Thrust blocks should only be used if connecting to existing unrestrained pipe or fittings and be explicitly shown on the plans, including location and thrust block size. Provisions shall be made to ensure that pipe joints, fittings and valves are not covered by the thrust block concrete.
- H. For utilities not covered by State Health Standards, separation shall never be less than 1 foot.
- I. All water pipe, fittings, valves, fire hydrants, and other appurtenances shall be installed in accordance with the American Water Works Association (AWWA), ANSI-61.
- J. Water supply service requirements and any work affecting off-site water facilities shall be in accordance with the requirements of the City of Sacramento Utility Services.
- K. Water pipes installed in paved areas shall be designed to withstand the external earth load and the AASHTO H-20 vehicle live load.
- L. Pipe material less than ½-inch shall be copper tubing per ASTM B88, Type K, annealed.
- M. Pipe material ½-inch to 3-inch shall be HDPE AWWA C901 DR 11 (Class 200).
- N. Pipe material larger than 3-inch shall be ductile iron AWWA C151/A21.51 or PVC AWWA C900.
- O. Pipe shall have a locating wire taped to the top of the pipe to facilitate location after installation.
- P. For pipes 4" and larger, all plugs, caps, tees, or bends with a deflection greater than eleven and a quarter degrees (11¼°) shall be supported by

concrete thrust blocks or mechanically restrained joints.

- Q. Pipe bedding material shall be sand extending at least 6-inches below the pipe, 12-inches above, and 12-inches on the sides.
- R. Backflow Prevention Assemblies shall be in accordance with the requirements of Title 17 of the California Administrative Code. Backflow devices must be installed such that the device is readily accessible for testing and maintenance and shall be located as close as practical to the point of service delivery (meter). As a minimum, backflow prevention assemblies shall be sized equivalent to the diameter of the service connection and shall be located above ground.
- S. Following disinfection, the entire system shall be isolated, and a hydrostatic pressure test conducted. The chlorinated water may be used to perform the test.
- T. New pipe, fittings and valves required for connection but not included in the hydrostatic pressure testing and disinfection procedures shall be disinfected prior to connection in accordance with AWWA Standard C651 relating to "Connections Equal to or Less Than One Pipe Length".

FIRE SUPPRESSION WATER DISTRIBUTION PIPING

33 11 19

- A. All material shall be currently listed in the Underwriters Laboratories, Inc., Fire Protection Equipment List and/or the Factory Mutual Approval Guide for use as intended in underground fire line installations and shall be acceptable to the AHJ. Vertical piping, piping installed within 5 feet of the building, and piping under all footings and slabs shall be cast, stainless steel, or ductile iron.
- B. All work shall be designed in accordance with the requirements of the most recent applicable editions of National Fire Protection Association (NFPA) 13 and 24, as well as the appropriate editions of the California Building Code and the California Fire Code, and the local jurisdiction having authority.
- C. Underground fire protection system shop drawings shall show all information required by NFPA 24. In addition, the shop drawings shall show the Soil Bearing Capacity of the soil as determined in the Soils Report and the location, design, and size of mechanical restraints.
- D. Uniflanges shall not be used on vertical piping, above ground, or in the basement. Tops of vertical risers shall be rodded down to the 90-degree bend at the base of the riser. Horizontal risers shall be rodded back to dead man of sufficient size to secure the flanged fitting.
- E. Fire Hydrants shall have 2.5-inch outlets and one 4.5-inch outlet. All outlets shall have a National Standard fire hose thread. Hydrants shall be wet barrel type.
 - 1. Install with the outlets facing the street and meeting the other requirements shown on the AHJ standard details and guidelines.

2. Where subject to mechanical injury, protect hydrants with bollards.
- F. Double Check Valves Assembly:
1. A double check valve assembly and Fire Department Connection (FDC) is required on all firelines.
 2. Location of this assembly must be approved by the Campus Architect and AHJ. Locate the assembly outside of the building in an accessible location mounted on a minimum 6-inch height concrete slab so that it remains clear of adjacent vegetation. Insulate the aboveground piping 6 inches and smaller with removable blanket insulation (fiberglass insulation is not acceptable).
 3. Where the backflow device is potentially subject to mechanical injury, protection shall be provided. The means of approved protection shall be arranged in a manner, which will not interfere with the connection to inlets.
- G. Fire department connection locations shall be approved by the AHJ.
1. Systems with a flow demand of 500 gpm or less shall provide four-inch pipe mount by 2-1/2 inch (Siamese), brass, dual clapper, freestanding fire department inlet connections, one-inch cast lettering, brass finish with plugs and chains or sensible caps.
 2. Systems with a flow demand greater than 500 gpm shall provide six-inch pipe mount by 2-1/2 inch, 4-way, brass, four clapper freestanding fire department inlet connections, one-inch cast lettering, brass finish. Inlet connections shall be oriented in a quad arrangement.
 3. Maintain a 5-foot clear radius around the fire department connection. Grade variation within this radius shall not exceed 1:12. The fire department connection arrangement shall be approved by the Campus Fire Marshal.
- H. Provide mechanical restraints. Thrust blocks will not be permitted except for Fire Hydrants. Depth of bury for piping shall be a minimum of 36 inches under vehicular paving. Measurement is from the top of the pipe to grade.

DOMESTIC WATER PIPING DISINFECTION

33 13 00

No new mains shall be connected to existing mains until they have been disinfected and pressure tested. Chlorination and testing of the water systems shall be in accordance with AWWA C 651. Disinfecting the new system may be performed concurrently with hydrostatic testing.

SANITARY SEWERAGE UTILITIES

33 30 00

- A. When sewers of uniform slope pass through a manhole, the slope will be maintained and the invert at the center of the manhole will be given. When sewers change slope at a manhole, incoming and outgoing invert elevations will be given. Provide sufficient drop through a manhole to compensate for energy loss caused by change of alignment. A minimum drop of 0.1 foot is required for a change of alignment greater than 30 degrees. When pipe

sizes change at structures, design the inlet crown at least as high as the outlet crown.

- B. Minimum velocity in each pipe segment shall be 2 feet per second, and a maximum velocity of 8 feet per second. Use Manning's formula to determine the relation of slope, design flow, velocity, and diameter. For design purposes, the "n" value is 0.013 for all main line materials. Size new main lines

smaller than 12 inches in diameter to carry the projected flow at a depth not greater than 70% of the inside diameter of the pipe (i.e. use a d/D of 0.7). Size new main lines 12 inches in diameter and larger to carry the projected flow assuming the pipe runs full (i.e. d/D of 1.0).

- C. Pipe material for gravity feed systems shall be VCP, HDPE, PVC C900, PVC C905, or SDR 26. Use standard bell and spigot pipe or butt fusion for connecting pipes. Use flexible connections to accommodate ground settling (e.g. pipe connections outside manholes and wet wells, and pipe connections outside of casings).
- D. Pipe material for force main systems shall comply with the requirements for high-pressure water mains.
- E. Pipe bedding material shall be sand extending at least 6-inches below the pipe, 12-inches above, and 12-inches on the sides.
- F. Connection to Existing Campus Sewer Main
1. Connect new mains to existing at existing manholes or by constructing a new manhole over the point of connection.
 2. Where an existing sewer main is to be extended, remove the existing plug, cleanout, or rodding inlet and install a manhole. The main may be extended without installation of a structure only if it is on the same line and grade, the pipe size and material are the same and the manhole spacing is adequate.
- G. Inverted Siphons
1. Inverted siphons shall be used only upon special approval after all other design options have been investigated.
 2. The siphon shall be designed with two barrels, with a gate system directing the flow toward either the primary or secondary barrel.
 3. Design to achieve a minimum velocity of 3 FPS maintained for several hours a day.
 4. Vertical curves shall be used for all change in slope (100 feet minimum).
 5. The rising slope of the downstream leg of the siphon shall be limited to 15%.
- H. Sewer Force Mains
1. Sewer force mains shall conform to the Water Construction Standards for water mains.
 2. Sewer force mains will be laid with a constant slope toward the pump station to allow for complete draining of the pipeline.

3. Locator boxes will be placed at every horizontal change in alignment or a maximum of every 500 feet. Boxes shall have the lids clearly marked, "SEWER."
- I. Alignment
1. Horizontal and vertical separation from Domestic Water lines must conform to the State of California, Department of Health Services, "Criteria for the Separation of Water and Sanitary Sewer."
 2. All mains must be a minimum five feet clear from all buildings, building overhangs, etc.
 3. Vertical curves or bend fittings in gravity sewer mains are not allowed.
- J. Laterals
1. Provide a separate lateral and cleanout for each building and structure within 10 feet of the structure.
 2. Cleanouts: Pipe extension to grade with compression type plug. Install curb box over riser pipe. Use precast concrete box Christy F8 with cast iron lid or approved equal in non-traffic areas and Christy G5 with cast iron lid or approved equal in traffic areas. Lids shall be marked "SEWER."
 3. Sewer laterals serving buildings or facilities which have plumbing fixtures with flood level rim elevations located below the next upstream sewer manhole rim require an approved backwater valve. Fixtures above such elevation shall not discharge through the backwater valve per UPC Section 409. Backwater valves shall be installed in a vault, pit or basement so the valve is easily accessible for maintenance. A cleanout must be installed within 5 feet downstream of the valve.
- K. Sanitary Sewer Manholes
1. A manhole is required at every horizontal or vertical change in alignment.
 2. Maximum distance between manholes is 300 feet.
 3. A manhole is required at the end of every main in excess of 200 feet in length.
 4. Manholes shall be constructed with eccentric cones.
 5. 60-inch diameter manholes are required for mains 18 inches or larger in diameter.
 6. The manhole will be designed such that the angle in the horizontal plain between the downstream and any incoming sewer is a minimum of 90 degrees.
 7. Stubs provided out of manholes for future extension will have rodding inlets provided when more than 20 feet of pipe is installed or where service laterals are connected to the stub.
 8. Standard drop manhole installations are required when the difference in elevation between the incoming and outgoing sewer is greater than 2 feet. While not encouraged, drop manholes may be required because of some physical restraints. They may not however, be used to merely avoid extra depth of trenching unless unusual circumstances exist. Upstream slope changes should be used to avoid the need for a drop manhole.
 9. When one drop connection is required, use a 60 inches diameter manhole. When two or more drop connections are required, use a 72

inches diameter manhole.

L. Industrial Waste Discharges

1. Grease traps, grease and sand traps, grease interceptors, and sampling structures as may be required by UC Davis Health shall be shown on the plans submitted for approval.
2. Food Service facilities must have a grease interceptor installed outside the facility in an area accessible for service vehicles.
3. Trash enclosures and other outdoor pad areas used for washing will be plumbed to the sanitary sewer system at grease interceptor or other connection point approved by the University Representative. Preventive measures must be taken to eliminate the intrusion of any rainwater or surface runoff.
4. Wash pad areas must be diked and/or sloped so that the smallest area possible drains to the sewer.

M. Lift Stations

1. Lift stations will not be allowed where an acceptable alternative gravity route exists.
2. Design the lift station to serve the entire tributary at build-out densities in accordance with sewer system master plan, LRDP and I/I allowances. Lift stations shall be designed to have pump redundancy.
3. All pumps, regardless of station type, will be non-clogging, capable of passing a minimum 3 inches diameter sphere.
4. Lift stations are not allowed within traffic areas.
5. Provide a reinforced concrete base slab sized adequately to counteract buoyancy. Provide supporting design calculations.
6. Provide a single surface pad over site that incorporates lift station access, wet well access and supporting generator and fuel supply tanks, as necessary.
7. Provide restrained flexible couplings on all outlet piping within 2 feet of the station wall.
8. All wet well components and all items in the wet well shall be non-corrosive plastic, stainless steel or other approved material.
9. Wet well to be minimum 72 inches in diameter with 4-hour capacity or as necessary to accommodate pumping equipment for submersible stations. Provide resilient-seat gate valve on inlet pipeline into wet well to provide wet well isolation.
10. Odor control systems shall be required.
11. Provide 6-inch PVC emergency by-pass system consisting of a suction line and a discharge line and a standpipe equipped with a cap and cam-lock connector. Bypass will be located in a vault. Standpipe connects to force main through an AWWA resilient-seat-gate valve with stainless steel trim and a check valve. The suction and discharge lines will have gate valves for isolation. Adequately support all piping.
12. Provide 1-inch minimum water service with reduced pressure backflow preventer and piping insulation.

13. Provide a minimum of two pumps and controls to alternate lead and lag pumping.
14. Provide hour meters for each pump that records pump run time, only if the motor is operating.
15. Provide a magnetic flow meter on the discharge of the pump station. Meters may be in an approved vault. Display will be installed in pump station control panel.
16. All pumps, motors, internal valves and piping, level indicators, control panel, will be assembled as a package. Supply and warranty will be through one company.

N. Submersible Pumping Stations

1. The lift station will consist of a minimum of two submersible centrifugal sewage pumps, guide rails, wet well access, discharge seal and elbow, motor control center, starters, liquid level control system and all hardware necessary to make a complete working system. Supply and warranty will be through a single company. Standards are ITT Flygt, Gorman Rupp Company or equal.
2. The pumps will be electric, submersible, centrifugal non-clogging units capable of passing a 3-inch sphere. Pump and motor will be suitable for continuous operation at full name plate load while the motor is completely submerged, partially submerged or not submerged. All electrical equipment/panels will be above ground.
3. Each pump will be furnished with a discharge connection system, which will permit removal and installation of pump without the need for the operator to enter the wet well.
4. All hardware in wet well, chains, cables and slide rails will be 316 stainless steel.

O. Lift Station Piping and Valving

1. When not included with package stations, all internal main lift station piping will be flanged or victaulic to allow for disassembly.
2. All main piping will have manual vents and drains to allow draining of sewage prior to piping disassembly.
3. Resilient-seat-gate valves will be used in station discharge piping. If space does not permit isolation valves for each pump use 3-way valves.
4. Main Pump Check Valves will be cast iron swing checks with externally weighted lever return. Check valve will not be installed in the vertical. Disc will be 316 stainless steel or cast iron with bronze trim. Pivot arm and bearing will be 316 stainless steel or cast iron with bronze trim. Pivot arm and bearing will be 316 stainless steel or bronze. Seat will be field replaceable with neoprene facing.

a. Electrical Equipment

- 1). Free standing electrical service with transfer switch, with heavy duty electrical weatherproof enclosure securely mounted in a manner acceptable to the Director of Utilities, a minimum of 24" above the ground. Provide generator receptacle to match Utility Division standard or stand-by generator. Provide a concrete pad around steel supports.

- 2). All pump motors will have solid state soft starters. They will be Allen-Bradley or approved equal and provided with solid state smart type motor starters with a pump control option used to provide ramp starting and stopping of motors. The controller will have the following start modes: soft start with selectable kick starts, current limit and full voltage.
- 3). Interior Lighting: Provide all control panels with a fluorescent interior light of the same approximate width of the control panel located along the top of the panel. Provide light with a separate light switch.
- 4). UPS: Provide an uninterruptible power supply sized for 150% of calculated load with sufficient battery backup time for 30 minutes of operation. Provide American Power Conversion, Best Power Products or equal.
- 5). Selectors and Pushbuttons: Provide corrosion resistant 30mm selectors and pushbuttons by Allen-Bradley or Square-D.

STORM DRAINAGE UTILITIES

33 40 00

- A. Size piping to accommodate a minimum of a minimum of 10-year storm event with overland flows to City right of way for larger storm events. Design velocity shall be a minimum of 2 ft/s and a maximum of 6 ft/s unless otherwise approved by the University Representative due to site and watershed constraints. Pipes shall be sized to carry the 10-year discharge with Hydraulic Grade Lines, HGL's, 0.5-foot below rim or inlet grate elevations.
- B. If stormwater detention is necessary, a 24-hour 10-year storm shall be used to size detention facilities prior to outlet to the City system .
- C. Under the federal Clean Water Act, storm water discharges in California are regulated through the National Pollutant Discharge Elimination System (NPDES) permits overseen by the State Water Board. NPDES permits have been issued and enforced to the City and County of Sacramento through the Central Valley Regional Water Quality Board requiring regulation and management of urban stormwater runoff including that for new developments and significant redevelopment projects. Management of stormwater runoff including low impact development (LID) and treatment control measures shall be in accordance with the Stormwater Quality Design Manual issued for the City of Sacramento.
- D. Pipe material shall be Class III RCP, HDPE, or PVC SDR-35 under normal loading conditions with proper cover. Where shallow cover or excessive loading is anticipated pipe design shall be presented to the University Representative for approval.
- E. Pipe bedding material shall be sand or crushed rock extending at least 6-inches below the pipe, 12-inches above, and 12-inches on the sides.
- F. Connections to Existing Campus Storm Main
 1. Provide a manhole at building main lateral connection to the storm main on campus.

2. For pipe penetrations through existing and new manholes, core through, install gasket around pipe, grout penetration on both sides and install a minimum of 6 inches around collar outside of the manhole penetration.
 3. Tap Connection - Use commercially manufactured wyes for branch connections. Field cutting into piping will not be permitted. Spring wyes into existing line and encase entire wye, plus 6 inches overlap, with not less than 6 inches of 3000 psi 28-day compressive strength concrete.
- G. For branch connections from side into existing 24 inch or larger piping, or to underground structures, cut opening into unit sufficiently large to allow 3 inches of concrete to be packed around entering connection. Cut ends of connection passing through pipe or structure wall to conform to shape of and be flush with inside wall, unless otherwise indicated. On outside of pipe structure wall, encase entering connection in 6 inches of concrete for minimum length of 12 inches to provide additional support or collar from connection to undisturbed ground. Use epoxy bonding compound as interface between new and existing concrete and piping materials.
- H. Direct connections from depressed loading docks (truck wells) to storm drains are prohibited.
1. Design drainage for new construction and/or redevelopment loading dock projects to minimize run-on and runoff of storm water. Loading areas must be sloped to direct flow towards a drain inlet connected directly to the sanitary sewer, or with a shutoff valve and sump with enough capacity to hold a spill while the valve is closed. Design to flow under gravity so the sump outlet is located at the upper portion of the sump to avoid creating a situation where water must be pumped out of the sump since most of the sewer/storm laterals are not very deep.
 2. Valves located in loading dock areas should be left open to facilitate drainage of storm water during normal conditions, and immediately closed in the event of a spill or sanitizing of the area.
- I. Lift Stations
1. Lift stations are discouraged and shall only be allowed with prior approval from the University Representative.

NATURAL GAS DISTRIBUTION

33 51 00

- A. Metering
1. The natural gas meter shall be installed at service connection to the building in an accessible location. Meter shall be capable of local and remote read-out per PG&E requirements.
- B. Steel Pipe
1. Pipe - Black steel, Schedule 40 with X-Trucoat, Greenline, or equal, factory wrap on buried lines.
 2. Fittings:
 - a. Buried: Steel butt-welding or socket welding type
 - b. Above Ground: Welding, or malleable iron threaded.

C. Valves

1. Underground: Valves under three inches shall be threaded and made up with threaded nipples, in a vise, before inserting into the line by welding. Valves three inches and larger shall be generally flanged and attached to slip-on welding flanges.
2. Lubricated plug cock: 1 inch and larger, Rockwell 115, Walworth, or equal. Provide lubricated plug cock for all below grade applications. Extend lubrication port and valve handle to a minimum of 6 inches below grade in valve box.
3. Corporation stops of dissimilar metal shall not be used.

D. Unions

1. Underground: Unions shall not be used.
2. Above ground: Flanged or threaded metal-to-metal shall be used.
3. Dielectric (insulated) unions shall be installed at designated points for cathodic protection.
4. Regulators and meters shall be protected from damage.

E. Corrosion Control - In order to provide protection of metal pipe from external, internal and atmospheric corrosion, provide an external protective coating and a cathodic protection system designed to protect the pipeline in its entirety.

1. Field Wrapping with cold-applied tape
 - a. coating odd shapes containing bolts, voids, or hard-to-wrap surfaces, two coats of mastic-type primer shall be used, with special care to assure that all surfaces are coated without introducing voids or pockets.
 - b. The bare metal surface to be wrapped must be dry and cleaned of rust, dirt, oil, and weld slag. Whenever tape wrap is applied over yard wrap, the outer coating of Kraft paper, whitewash, mica, flakes, protective plastic outer wrap, etc., shall be removed.
 - c. Plastic coated pipe, prime area to be wrapped plus a minimum length of 4 inches from the cutback edge. Tape shall be applied by first lapping over approximately one tape width of the prepared end of the wrap. The wrap should be spiraled along the line, with each spiral overlapping the previous spiral by one-half the tape width plus one-quarter inch, to assure a double thickness at all points. The tape should be applied with enough tension to achieve a tightly bonded smooth wrap, free of wrinkles or voids. Do not over-stretch.
2. Asphalt Coating - Small defects (less than 3 inches across) - slight damage where the asphalt wrap is still bonded to the pipe and no penetration has occurred may be repaired by a single patch. Prepare the surface of the asphalt wrap by removing the outside coating with a wire brush, prime and apply the single layer of tape so that it extends 2 inches beyond the damaged area in all directions. If penetration of the asphalt wrap has occurred or the bond has been broken, all loose wrapping shall be removed to the bare pipe. The area shall be primed, and the standard spiral wrap applied. Large defects (greater than 3

- inches across) - if the pipe coating is still bonded and penetration has not occurred, prepare the surface by removing the outside coating with a wire brush, prime, and wrap tape completely around pipe, extended two inches beyond the damaged area on each side. If penetration of the coating has occurred or the bond has been broken, all loose or damaged coating shall be removed. Prime and apply the first layer of tape, patch fashion, and the next layer shall use the standard spiral wrap, extending 2 inches beyond the damaged area.
3. Plastic or Tape Coating - On plastic-coated pipe, repairs shall be treated as a large defect by wrapping completely around the pipe as required. The entire plastic surface to be coated shall be cleaned. On tape-coated pipe, repairs shall be done by removing the outer wrap several inches back from the area of defect, then prime and apply tape to the damaged area. It is not necessary to remove the inner wrap.
- F. Qualification of Welders - Only welders who are currently qualified in accordance with the following may perform welds on a gas pipeline:
1. Section IX of the American Society of Mechanical Engineers Association (ASME) Boiler and Pressure Vessel Code.
 2. Section 3 of American Petroleum Institute (API) Standard 1104
 3. Appendix C of Federal Register, Vol. 35, No. 161.
- G. Underground Clearance - Sufficient clearance shall be maintained between mains and other underground structures to:
1. Permit installation and operation of maintenance and emergency control devices such as leak clamps.
 2. Permit installation of service laterals to both the mains and to other underground structures.
 3. Provide heat damage protection from other underground facilities such as steam or electric power lines. This is especially critical for cathodically protected pipeline, which must be isolated from underground foreign piping.
- H. Plastic Pipe
1. No plastic natural gas lines shall be accepted without prior approval of the University Representative.
- I. Service Lines (plastic)
1. 24 inch minimum of cover in streets; 18 inch minimum of cover otherwise.
 2. For main connections, a protective sleeve designed for the specific type of connection shall be used to reduce stress concentrations.
 3. At building wall, the transition from plastic pipe to more rigid piping should be protected from shear and bending as at the main connection. Where possible the trench bottom should be compacted and smoothed, where not possible, some other method of continuous support for the service line should be provided over the disturbed soil.
 4. The service line shall be graded to drain any possible condensate into the main.
 5. Each service line shall be installed to minimize anticipated piping strain and external

01 - General Requirements

- loading.
6. Each service line shall have a service line valve.
- J. Piping shall be installed with sufficient clearance, or shall be insulated from any source of heat, such as steam or electric power lines, particularly when installed in common trenches.
1. Plastic pipe shall be laid on undisturbed soil, well compacted soil, well tamped soil, or other continuous support. Blocking shall not be used to support pipe.
 2. Piping shall be installed with sufficient slack to provide for possible contraction.
 3. Piping shall be installed with enough clearance to allow proper maintenance and to protect against damage that might result from proximity to other structures.
 4. Bends should be free of buckles, cracks, or other damage, and may not be deflected to a radius smaller than the minimum recommended by the manufacturer.
- K. Valve installation - Designed to protect the plastic material against excessive torsion or shearing load when the valve is operated and from any other secondary stresses that might be exerted through the valve or its enclosure. Prevent excessive strains at valve installations by:
1. Use a valve having low operating torque.
 2. Anchor the valve body to resist twisting.
 3. Make the transition from plastic to metal some distance from the valve. Any transition shall be supported by undisturbed or well compacted soil, by bridging or by sleeve encasement. Transition pieces 2 feet long will usually provide sufficient stabilization.
 4. Use rigid pipe casing fastened to the valve. Casing pieces 2 feet long will usually provide stabilization.
 5. Use a metallic pipe sleeve rigidly connected to the valve and encasing the plastic.
- L. Cathodic Protection of Isolated Steel components in Plastic piping systems - Provide one of the following:
1. A small galvanic anode directly connected to the steel component.
 2. Each steel component may be connected to a locator wire which is also connected to one or more galvanic anodes. To facilitate monitoring, the locator wire may be terminated at one or more service risers.
 3. Use of certain metal fittings in plastic pipelines without coating, cathodic protection, and monitoring when adequate external corrosion control is provided by alloy.
 4. Type 316 stainless steel or equally corrosion resistant component.
- M. Valve enclosures - Where curb boxes or other enclosures are used, they shall not be supported by the plastic pipe and shall not in any way impose secondary stresses.

N. Testing (Steel and Plastic)

1. Mains shall be pressure tested at a minimum of 100 psi, for a minimum time of 4 hours. Servicelines shall be pressure tested at a minimum of 50 psi, for a minimum time of 4 hours.

HYDRONIC ENERGY DISTRIBUTION

33 61 00

- A. Underground direct-buried chilled water and heating hot water piping shall be factory pre-insulated schedule 40 carbon steel, ASTM A-53, Grade B., ERW (Type E) or seamless (Type S), standard weight for sizes 2" and larger, and shall be ASTM A-106, Grade B, standard weight for sizes 1-1/2" and smaller (Std. Wt. is the same as Sch. 40 through 10"). All carbon steel pipe shall have ends cutsquare and beveled for butt-welding. Straight sections of factory insulated pipe shall have 6" of exposed pipe at each end for field joint fabrication. Underground piping systems shall be pre-engineered. Factory shall provide piping stress calculations and expansion and contraction compensation provisions, utilizing factory prefabricated and pre-insulated expansion elbows, Z-bends, expansion loops, and anchors specifically designed for the intended application. Provide a leak detection system.
- B. Underground chilled water piping insulation shall be 90% closed cell polyurethane with a minimum 2.0lbs. per cubic foot density, compressive strength of 30 psi @ 75°F, and coefficient of thermal conductivity (K-Factor) of not higher than 0.16 @ 75°F per ASTM C-518. Jacketing shall be extruded, black, high density polyethylene (HDPE), having a minimum wall thickness not less than 100 mils for pipe sizes less than or equal to 12", 125 mils for jacket sizes larger than 12" to 24". Chilled water factory pre-insulated pre-engineered piping systems shall be Ferro-Therm by Thermacor Process, L.P., of Fort Worth, Texas.
- C. Underground heating hot water piping insulation shall be suitable for carrying an absolute minimum of 300 °F heating hot water at a minimum 150psi. Insulation shall be polyisocyanurate foam insulation bonded to both the jacketing and carrier pipe with a minimum thickness of 2-1/2" for systems operating at or below 300°F. Insulation shall be rigid, 85% closed cell foam insulation with not less than 2.4 pounds per cubic foot density, having a compressive strength of not less than 30 psi @ 75°F and a coefficient of thermal conductivity (K-Factor) not higher than 0.17 @ 75°F and 0.30 @ 300°F. Maximum operating temperature of the system shall not exceed 300°F. Polyurethane foam insulation shall NOT be acceptable for heating hot water piping. Furnish a complete HDPE jacketed system of factory pre-insulated steel piping for the specified service. The jacket throughout the entire system shall incorporate electric fusion, butt fusion, or extrusion welding at all fittings, joint closures, or other points of connection. All pre-insulated pipe, fittings, insulating materials, and technical support shall be provided by the Pre-insulated Piping System manufacturer. Factory pre-insulated pre-engineered piping system for underground heating hot water shall be HT-406 as manufactured by Thermacor Process, L.P., of Fort Worth, Texas.
- D. Provide manufacturer's shop drawings with dimensioned piping layout and details of all expansion loops, Tee joints, elbows, anchor points, building and/or manhole entry points and all other pertinent information. All the

manufacturer's submittal documents shall be stamped by a California registered professional engineer.

- E. Underground systems Shall be buried in a trench of not less than two feet deeper than the top of the pipe and not less than eighteen inches wider than the combined O.D. of all piping systems. A minimum thickness of 24 inches, unless specified otherwise elsewhere, of compacted backfill over the top of the pipe will meet H-20 highway loading.
- F. Piping systems shall be cleaned, flushed and water treated to the satisfaction of the University Representative. Coordinate with UC Davis Health's closed systems water treatment requirements.
- G. Valves: Heating Hot Water (HHW) full ported pre-insulated ball valves and Chilled Water (CHW) full ported, flanged valves suitable for direct buried in the ground. Shut off valves on CHW shall be butterfly type. All valves shall be flanged. Valves installed in insulated piping lines shall have valve handle extensions to clear the insulation. All underground valves shall pre-insulated. Valves and valve operator stem to the surface shall fully protected from exposure to soil. Shut-off valves shall be provided local to the point of connection to the main HHW and CHW loops and at the point of connection to the building. Isolation valve located below ground shall be direct buried in the ground with sleeve to the surface to allow for operation of the valve. Valve insulation shall match the piping system insulation and outer jacketing shall be High Density Polyethylene.

STEAM ENERGY DISTRIBUTION

33 63 00

- A. Insulated and jacketed underground steam and condensate piping system with prefabricated manholes for high-pressure line drip steam traps. The UC Davis Health campus has a 4-inch underground high-pressure, (100-125 psi) process-steam pipe and 2-inch pumped condensate return piping system, installed in common factory-jacketed 10-gage steal conduit. Factory pre-insulated pre-engineered steam and condensate return piping conduits systems shall be by ThermaCor Process Inc.
 - 1. Provide schedule 40 steam piping and schedule 80 condensate -return piping. Piping shall be spaced and supported in conduit with full round insulated guides. Piping insulation shall be pre-formed mineral wool.
 - 2. Provide expansion loops and system anchors. Piping systems shop drawings shall be stamped by a California professional engineer.
 - 3. Slope piping to manholes. Manholes shall be cylindrical round shell constructed of ½ inch steel plate. Epoxy coat manholes and provide cathodic protection system connected to each manhole with buried anodes. Locate high-pressure line drip thermodynamic steam traps in manholes for service and accessibility.
 - 4. Conduit system shall be jacketed and coated with factory coating to fully protect the conduit from the soil and ground water.

Appendix A Abbreviations &

Definitions

ACI	American Concrete Institute
ADA	Americans with Disabilities Act Accessibility Guidelines
AESS	Architecturally Exposed Structural Steel
AISC	American Institute of Steel Construction
ANSI	American National Standards Institute
ASCE	American Society of Civil Engineers
ASHRAE	American Society of Heating, Refrigerating and Air-Conditioning Engineers
ASME	American Society of Mechanical Engineers
ASTM	American Society for Testing and Materials
BHMA	Builders Hardware Manufacturers Association

SECTION 01 40 00 00 - QUALITY CONTROL

PART 1 GENERAL

1.01 GENERAL

- A. Definitions.
 - 1. The term "University's Testing Laboratory" means a testing laboratory retained and paid for by University for the purpose of reviewing material and product reports and performing other services as determined by University.
 - 2. The term "Contractor's Testing Laboratory" means a testing laboratory retained and paid for by Contractor to perform the testing services required by the Contract Documents. Contractor's Testing Laboratory shall be an organization other than University's Testing Laboratory and shall be acceptable to University's Representative. It may be a commercial testing organization, the testing laboratory of a trade association, the certified laboratory of a supplier or manufacturer, Contractor's own forces, or other organization. Contractor's Testing Laboratory shall have performed testing of the type specified for at least 5 years.
- B. Tests, inspections, and acceptances of portions of the Work required by the Contract Documents or by Applicable Code Requirements shall be made at the appropriate times. Except as otherwise provided, Contractor shall make arrangements for such tests, inspections, and acceptances with Contractor's Testing Laboratory. Contractor shall give University's Representative timely notice of when and where tests and inspections are to be made.
- C. If such procedures for testing, inspection, or acceptance reveal failure of the portions of the Work to comply with requirements established by the Contract Documents, Contractor shall bear all costs made necessary by such failure including those of repeated procedures and compensation for University's Representative's services and expenses.
- D. If University's Representative is to observe tests, inspections, or make acceptances required by the Contract Documents, University's Representative will do so promptly and, where practicable, at the normal place of testing.
- E. Tests or inspections conducted pursuant to the Contract Documents shall be made promptly to avoid unreasonable delay in the Work.

1.02 CONTRACTOR'S RESPONSIBILITIES REGARDING UNIVERSITY'S TESTING LABORATORY

- A. Secure and deliver to University's Testing Laboratory adequate quantities of representative samples of materials proposed for use as specified.
- B. Submit to University's Testing Laboratory the preliminary design mixes proposed to be used for concrete and other materials which require review by University's Testing Laboratory.
- C. Submit copies of product test reports as specified.
- D. Furnish incidental labor and facilities:
 - 1. To provide University's Testing Laboratory access to the Work to be tested.
 - 2. To obtain and handle samples at the Project site or at the source of the product to be tested.
 - 3. To facilitate inspections and tests.
 - 4. For storage and curing of test samples.
- E. Provide notice to University's Representative sufficiently in advance of operations to allow for University's Testing Laboratory assignment of personnel and scheduling of tests.
- F. When tests or inspections are not performed after such notice, Contractor shall reimburse University for University's Testing Laboratory personnel and travel expenses incurred.

01 - General Requirements

1.03 TESTS AND INSPECTIONS

- A. Certain portions of the Work will be tested and/or inspected at various stages. Nothing in any prior acceptance or satisfactory test result shall govern, if at any subsequent time the Work, or portion thereof, is found not to conform to the requirements of the Contract Documents.

1.04 ADDITIONAL TESTING AND INSPECTION

- A. If initial tests or inspections made by University's Testing Laboratory reveal that any portion of the Work does not comply with Contract Documents, or if University's Representative determines that any portion of the Work requires additional testing or inspection, additional tests and inspections shall be made as directed.
- B. If such additional tests or inspections establish that such portion of the Work complies with the Contract Documents, all costs of such additional tests or inspections shall be paid by University.
- C. If such additional tests or inspections establish that such portion of the Work fails to comply with the Contract Documents, all costs of such additional tests and inspections, and all other costs resulting from such failure, including compensation for University's Representative and University's consultants shall be deducted from the Contract Sum.

1.05 TEST REPORTS

- A. University's Testing Laboratory and Contractor's Testing Laboratory shall submit 1 copy of all reports to University's Representative and University's Inspector of Record, indicating observations and results of tests and indicating compliance or non-compliance with the Contract Documents.
- B. University's Representative will distribute 1 copy each of the reports to University Facilities, University's Consultants, and Contractor.

PART 2 PRODUCTS- NOT USED

PART 3 EXECUTION

3.01 REPAIR

- A. See Section 01070 - Demolition, Cutting and Patching.

3.02 PROTECTION

- A. See Section 01600 - Material and Equipment.

3.03 CLEANING

- A. See Section 01710 - Clean up and Disposal.

END OF SECTION 01 40 00 00

SECTION 01 40 00 00a - INSPECTION OF WORK

PART 1 GENERAL

1.01 GENERAL

- A. The University will employ one or more qualified Inspectors of Record, acceptable to the Division of Facilities Development of the Office of Statewide Health Planning and Development who will be employed continuously at the construction site, working under the University Representative's general direction. The IOR(s) will observe progress of the work and to report to the University's Representative any non-conformance with Contract Documents.
- B. In compliance with the State Building Code, Part 1, Title 24 of the California Code of Regulations, Article 7-145, the Inspector of Record shall have personal knowledge, obtained by continuous inspection of all parts of the work of construction in all stages of its progress, to ensure that the work is in accordance with the approved contract documents.
- C. Specific duties and limits of responsibilities of the Inspectors of Record include the following:
 - 1. Observing and spot checking materials upon arrival at site, and work in progress, to determine conformance with Contract Documents. Reporting any defects immediately to the University's Representative
 - 2. Maintaining liaison with the Contractor and his Subcontractors only through Contractor's superintendent.
 - 3. Evaluating Contractor's suggestions and reporting them with recommendations to the University's Representative for final decision.
 - 4. Remaining alert to the Construction Schedule and immediately reporting any potential delays and problems to the University's Representative.
 - 5. Maintaining a Daily Log of activities on site, pertinent to a continuous project report record.
 - 6. Preparing a Verified Report every 3 months (or sooner if required for a specific project schedule).
 - 7. Receiving Samples of construction materials at the jobsite.
 - 8. Scheduling and accompanying regulatory inspectors through the project and reporting to the University's Representative the results of such inspection visits.
 - 9. Being alert to conditions which could affect University's existing operation.
 - 10. Reviewing and verifying degree of work completion with that cited in Contractor's monthly payment request.
 - 11. Maintaining Contract information and Shop Drawing files.
 - 12. Preparing a Field Inspection Report of incomplete or unsatisfactory work at intervals throughout the work progress. IOR to check off such items when they are made complete and satisfactory by Contractor.
 - 13. Attending project meetings in accordance with specifications Section 01200- Project Meetings.
 - 14. Enforcing Infection Control in accordance with specifications Section 01021- Infection Control.
 - 15. Provide all coordination for independent Testing Laboratories.
 - 16. Participate in formation of Final "Punch List".
- D. Acts or omissions of any inspector (including without limitation inspectors' failure to observe or report deficiencies in Contractor's Work) shall not relieve Contractor from its responsibility to complete the Work in accordance with the Contract Documents.
- E. Provision of inspectors by University, if any, or by the Office of Statewide Health Planning and Development pursuant to Specification Section 01041- Project Coordination (Part 3) shall be subject to the following:
 - 1. Contractor shall allow inspectors full access to the Project at all times the work is in progress.
 - 2. Contractor shall not take any direction, approvals or disapprovals from inspectors.
 - 3. Contractor shall not rely on inspectors to ensure that the Work is completed in accordance with the Contract Documents.

01 - General Requirements

F. Test and Inspection Reports

1. University's Inspector shall submit one (1) copy of all inspection reports to University and/or University's Designee indicating observations and results and indicating compliance or non-compliance with the Contract Documents.

SECTION 01 42 13 00 - ABBREVIATIONS AND ACRONYMS

1.1 GENERAL

A. Description Of Work

1. This specification covers abbreviations, acronyms, definitions, and symbols used in the Contract Documents.

B. Unit of Measure Definitions

1. Following is a list of Industry Standard abbreviations.

A	Area Square Feet; Ampere	B&W	Black and White
AB	Anchor Bolt	BC	Between Centers
ABC	Aggregate Base Course	BCY	Bank Cubic Yard
ABS	Acrylonitrile Butadiene Styrene	BDL	Bundle
AC	Alternating Current; Air-Conditioning; Asphaltic Concrete; Plywood Grade A & C	BD FT	Board Feet
ACFM	Actual Cubic Feet Per Minute	BEV	Bevel/Beveled
ACM	Asbestos Containing Material	BF	Board Feet
ACP	Asphaltic Concrete Paving	BFP	Boiler Feed Pump
ACR	Acre	BHN	Brinell Hardness Number
ACZA	Ammoniacal Copper Zinc Arsenate	BHP	Boiler Horsepower; Brake Horsepower
AD	Plywood, Grade A & D	BI	Black Iron
ADDL	Additional	Bit.	Bituminous
ADJ	Adjustable	Bitum.	Bituminous
ADMIN	Administer; Administration	Bk.	Backed
AGG	Aggregate	Brkrs.	Breakers
AH	Ampere Hours	Bldg.	Building
AHM	Ampere-Hour Meter	BLK	Black; Block
AHU	Air Handling Unit	BM	Bank Measure; Beam
AIC	Amperes Interrupting Capacity	BOD	Biochemical Oxygen Demand
AL	Aluminum	BOX	Box (each)
ALT	Alternate	BR	Bedroom
AMP	Ampere	Brg.	Bearing
AMT	Amount	BRK	Brick
AOT	Adjusted Oxygen Transfer	BTFLY VLV	Butterfly Valve
APP	Attactic Polypropylene	BTR	Better (Lumber)
APPROX	Approximate	BTU	British Thermal Units
Apt.	Apartment	BTU/HR	British Thermal Units per Hour
ART	Articulated	BUR	Built Up Roof
ASB	Asbestos	BW	Butt Weld
ASJ	All Surface Jacketing	BWG	Birmingham Wire Gauge
Avg.	Average	BX	Interlocked Armored Cable
AWG	American Wire Gauge	C	Centigrade; Conductance; Conductivity, Hundred
BAG	Bag	CA	Corrosion Allowance
BBL	Barrel	Cab.	Cabinet
B&B	Grade B and Better; Balled & Burlapped	CAP	Capacity
B&S	Bell and Spigot	CB	Circuit Breaker
		CC	Center to Center
		CCA	Chromate Copper Arsenate
		CCF	Hundred Cubic Feet

01 - General Requirements

CCY	Compacted Cubic Yard	Dis.	Discharge
cd	Candela	Disch.	Discharge
cd/sf	Candela per Square Foot	DB	Dry Bulb; Decibel
CF	Cubic Foot (Feet)	DBL	Double
CFM	Cubic Feet per Minute	DC	Direct Current
CHG	Charge	DCS	Distributed Control System
CHW	Chilled Water; Commercial Hot Water	DDC	Direct Digital Control
CI	Cast Iron	Demob	Demobilization
CIP	Cast in Place; Cast Iron Pipe	DF	Douglas Fir
CIRC	Circulating; Circuit	DFT	Dry Film Thickness
CLF	Hundred Linear Feet; Current Limiting Fuse	DH	Double Hung
CLP	Cross Linked Polyethylene	DHW	Domestic Hot Water
cm	Centimeter	DI	Ductile Iron
CMP	Corrugated Metal Pipe	D/P	Differential Pressure
CMPA	Corrugated Metal Pipe - Arched	DIA	Diameter
CMU	Concrete Masonry Unit	Diam	Diameter
CO	Carbon Monoxide	Diag.	Diagonal
CO2	Carbon Dioxide	Distrib.	Distribution
COL	Column	DL	Dead Load; Diesel
Comb	Combination	DLH	Deep Long Span Bar Joist
Compr	Compressor	DPST	Double Pole, Single Throw
CONC	Concrete	DS	Double Strength
CONSTR	Construction	DSA	Double Strength A Quality Glass
Cont	Continuous; Continued	DSB	Double Strength B Quality Glass
Corr	Corrugated	DWV	Drain, Waste, Vent Piping
CP	Chrome Plated	DX	Deluxe White, Direct Expansion
CPE	Chlorinated Polyethylene	dyn	Dyne
Cplg.	Coupling	e	Eccentricity
CPM	Cycles per Minute	E	Electrical Grade (Fiberglass Construction)
CPM	Critical Path Method	EA	Each
CPS	Centipoise	Econ.	Economy
CPRSR	Compressor	ECR	Electrical Grade, Corrosion Resistant (Fiberglass Construction)
CPVC	Chlorinated Polyvinyl Chloride	EDP	Electronic Data Processing
CS	Carbon Steel	EDR	Equiv. Direct Radiation
CSF	Hundred Square Feet	EG	Electro Galvanized
CSPE	ChloroSulphinated Polyethylene	EIFS	Exterior Insulation Finish System
CSS	Cast Semi Steel	ELEC	Electric; Electrical
CT	Current Transformer	Elev.	Elevator; Elevating
CTB	Cement Treated Base	EM	Electron Microscopy
CTR	Center	EMT	Electric Metallic Tubing; Thin Wall Conduit
CU FT	Cubic Foot	Eng.	Engine, Engineered
CU IN	Cubic Inch	EPDM	Ethylene Propylene Diene Monomer
CU YD	Cubic Yard	EPS	Expanded Polystyrene
CW	Chilled Water; Cold Water	EQL	Equally
CWR	Chilled Water Return	Equip.	Equipment
CWS	Chilled Water Supply	ERW	Electrical Resistance Welded
CWT	Hundred Weight	EROPS	Enclosed Roll Over Protection System
CY	Cubic Yard (27 cu. ft.); Cycle	ES	Energy Saver
CYH	Cubic Yards Per Hour	Est.	Estimated
Cyl	Cylinder	EW	Each Way
d	Penny (nail size)	EWT	Entering Water Temperature
D	Deep; Depth; Discharge		

Excav.	Excavation	Gen.	General
EXH	Exhaust	GFCI	Ground Fault Circuit Interrupter
Exp.	Expansion; Exposure	GFR	Ground Fault Relay
EXP JT	Expansion Joint	GPD	Gallons per Day
Ext.	Exterior	GPH	Gallon per Hour
		GPM	Gallon per Minute
F	Fahrenheit; Female; Fill	GR	Grade
f	Fiber stress	Grnd.	Ground
f _c	Compressive Stress in Concrete	GSF	Ground Square Foot
f _y	Minimum Yield Stress of Steel	GVW	Gross Vehicle Weight
f _m	Compressive Strength of Masonry		
F&D	Flanged-and-Dished	H	High, Height; High Strength Bar Joist
F&I	Furnished and Installed	HC	Handicapped; High Capacity
Fab.	Fabricated	HD	High Density; Heavy Duty
FAD	Free Air Delivery	HDO	High Density Overlay
FBGS	Fiberglass	HDPE	High Density Polyethylene
FC	Footcandles	Hdr.	Header
FCXP	Fan Cooled Explosion Proof	Hdw.	Hardware
FDA	Food and Drug Administration	HEPA	High Efficiency Particulate Air
FEP	Fluorinated Ethylene Propylene (Teflon)	Hg	Mercury

3. Explanation Of Terms

BTU: Stands for British Thermal Unit. The BTU number indicates the amount of heat required to raise one pound of water by one degree Fahrenheit. What this means is the higher the BTU rating, the higher the heating capacity of a product.

MBH: Equal to 1000 BTUs.

Tons (In Reference To Cooling): Unit of measurement for determining cooling capacity. One ton equals 12,000 BTUH.

SEER: Stands for Seasonal Energy Efficiency Ratio. This measures the cooling efficiency in air conditioners or heat pumps. The higher the SEER rating, the more energy-efficient the unit. The government's minimum SEER rating is 10.

4. Calculation Of Board Feet

a. All Lumber Grades Are Presumed To Be 75 Percent Construction And 25 Percent Standard Or Equivalent Grade Unless Otherwise Listed. Dimensions Are Nominal. Board Foot Is Defined As 1" x 12" x 1' Long; To Calculate BF/LF, Multiply The Size Of The Board Height x Width/12.

- 1) 1"x2" = 0.167 BF/LF
- 2) 1"x3" = 0.25 BF/LF
- 3) 2"x3" = 0.5 BF/LF
- 4) 2"x4" = 0.667 BF/LF
- 5) 2"x6" = 1.0 BF/LF
- 6) 2"x8" = 1.333 BF/LF
- 7) 2"x10" = 1.667 BF/LF
- 8) 2"x12" = 2.0 BF/LF
- 9) 4"x4" = 1.333 BF/LF
- 10) 6"x4" = 2.0 BF/LF
- 11) 6"x6" = 3.0 BF/LF
- 12) 8"x8" = 5.333 BF/LF
- 13) etc.

b. To Calculate Board Feet;

- 1) For most lumber: Thickness (inches) x width (inches) x length (feet) divided by 12 = board feet.
- 2) For small pieces: Thickness (inches) x width (inches) x length (inches) divided by 144 = board feet.

Gneiss	4550	2720	3180

D. Reclaimed Asphalt Pavement (RAP)

1. Origin
 - a. Reclaimed asphalt pavement (RAP) is the term given to removed and/or reprocessed pavement materials containing asphalt and aggregates. These materials are generated when asphalt pavements are removed for reconstruction, resurfacing, or to obtain access to buried utilities. When properly crushed and screened, RAP consists of high-quality, well-graded aggregates coated by asphalt cement.
 - b. Asphalt pavement is generally removed either by milling or full-depth removal. Milling entails removal of the pavement surface using a milling machine, which can remove up to 50 mm (2 in) thickness in a single pass. Full-depth removal involves ripping and breaking the pavement using a rhino horn on a bulldozer and/or pneumatic pavement breakers. In most instances, the broken material is picked up and loaded into haul trucks by a front-end loader and transported to a central facility for processing. At this facility, the RAP is processed using a series of operations, including crushing, screening, conveying, and stacking.
 - c. Although the majority of old asphalt pavements are recycled at central processing plants, asphalt pavements may be pulverized in place and incorporated into granular or stabilized base courses using a self-propelled pulverizing machine. Hot in-place and cold in-place recycling processes have evolved into continuous train operations that include partial depth removal of the pavement surface, mixing the reclaimed material with beneficiating additives (such as virgin aggregate, binder, and/or softening or rejuvenating agents to improve binder properties), and placing and compacting the resultant mix in a single pass.
2. Physical Properties
 - a. The properties of RAP are largely dependent on the properties of the constituent materials and the type of asphalt concrete mix (wearing surface, binder course, etc.). There can be substantial differences between asphalt concrete mixes in aggregate quality, size, and consistency. Since the aggregates in surface course (wearing course) asphalt concrete must have high resistance to wear/abrasion (polishing) to contribute to acceptable friction

- resistance properties, these aggregates may be of higher quality than the aggregates in binder course applications, where polishing resistance is not of concern.
- b. Both milling and crushing can cause some aggregate degradation. The gradation of milled RAP is generally finer and more dense than that of the virgin aggregates. Crushing does not cause as much degradation as milling; consequently, the gradation of crushed RAP is generally not as fine as milled RAP, but finer than virgin aggregates crushed with the same type of equipment.
 - c. The particle size distribution of milled or crushed RAP may vary to some extent, depending on the type of equipment used to produce the RAP, the type of aggregate in the pavement, and whether any underlying base or subbase aggregate has been mixed in with the reclaimed asphalt pavement material during the pavement removal.
 - d. During processing, virtually all RAP produced is milled or crushed down to 38 mm (1.5 in) or less, with a maximum allowable top size of either 51 mm (2 in) or 63 mm (2.5 in). Table 13-1 lists the typical range of particle size distribution that normally results from the milling or crushing of RAP. Milled RAP is generally finer than crushed RAP. The pavement fraction passing a 2.36 mm (No. 8) sieve can be expected to increase from a premilled range of 41 to 69 percent to a postmilled range of 52 to 72 percent. The fraction passing a 0.075 mm (No. 200) sieve can be expected to increase from approximately 6 to 10 percent to a range of 8 to 12 percent. Most sources of RAP will be a well-graded coarse aggregate, comparable to, or perhaps slightly finer and more variable than, crushed natural aggregates.
 - e. The unit weight of milled or processed RAP depends on the type of aggregate in the reclaimed pavement and the moisture content of the stockpiled material. The unit weight of milled or processed RAP has been found to range from 1940 to 2300 kg/m³ (120 to 140 lb/ft³), which is slightly lower than that of natural aggregates.
 - f. Moisture content of the RAP will increase while in storage. Crushed or milled RAP can pick up a considerable amount of water if exposed to rain. Moisture contents up to 5 percent or higher have been measured for stored crushed RAP. As noted earlier, during periods of extensive precipitation, the moisture content of some RAP stockpiles may be as high as 7 to 8 percent. Lengthy stockpiling of crushed or milled RAP should, therefore, be kept to a minimum.
 - g. The asphalt cement content of RAP typically ranges between 3 and 7 percent by weight. The asphalt cement adhering to the aggregate is somewhat harder than new asphalt cement. This is due primarily to exposure of the pavement to atmospheric oxygen (oxidation) during use and weathering. The degree of hardening depends on several factors, including the intrinsic properties of the asphalt cement, the mixing temperature/time (increases with increasing high temperature exposure), the degree of asphalt concrete compaction (increases if not well compacted), asphalt cement/air voids content (increases with lower asphalt/higher air voids content), and age in service (increases with age).

Table 1. Typical range of particle size distribution for reclaimed asphalt pavement (RAP) (percent by weight passing).

Screen Size (mesh)	Percent Finer After Processing or Milling
37.5 mm (1.5 in)	100
25 mm (1.0 in)	95 - 100
19 mm (3/4 in)	84 - 100
12.5 mm (1/2 in)	70 - 100
9.5 mm (3/8 in)	58 - 95
75 mm (No. 4)	38 - 75
2.36 mm (No. 8)	25 - 60
1.18 mm (No. 16)	17 - 40
0.60 mm (No. 30)	10 - 35 ^a
0.30 mm (No. 50)	5 - 25 ^b
0.15 mm (No. 100)	3 - 20 ^c
0.075 mm (No. 200)	2 - 15 ^d
a. Usually less than 30 percent b. Usually less than 20 percent c. Usually less than 15 percent d. Usually less than 10 percent	

- h. The RAP obtained from most wearing surface mixes will usually have an asphalt content in the 4.5 to 6 percent range. The recovered asphalt from RAP usually exhibits low penetration and relatively high viscosity values, depending on the amount of time the original pavement has been in service. Penetration values at 25°C (77°F) are likely to range from 10 to 80 while the absolute viscosity values at 60°C (140°F) may range from as low as 2,000 poises (equivalent to AC-20) up to as high as 50,000 poises or greater, depending on the extent of aging. Viscosity ranges from 4,000 to 25,000 poises can normally be expected from the asphalt cement that is recovered from RAP material. Table 2 provides a summary of the typical ranges of physical properties of RAP, other than gradation.

Table 2. Physical and mechanical properties of reclaimed asphalt pavement (RAP).

Type of Property	RAP Property	Typical Range of Values
Physical Properties	Unit Weight	1940 - 2300 kg/m ³ (120-140 lb/ft ³)
	Moisture Content	Normal: up to 5% Maximum: 7-8%
	Asphalt Content	Normal: 4.5-6% Maximum Range: 3-7%
	Asphalt Penetration	Normal: 10-80 at 25°C (77°F)
	Absolute Viscosity or Recovered Asphalt Cement	Normal: 4,000 - 25,000 poises at 60°C (140°F)
Mechanical Properties	Compacted Unit Weight	1600 - 2000 kg/m ³ (100-125 lb/ft ³)
	California Bearing Ratio (CBR)	100% RAP: 20-25% 40% RAP and 60% Natural Aggregate: 150% or higher

3. Chemical Properties

- a. Mineral aggregates constitute the overwhelming majority (93 to 97 percent by weight) of RAP. Only a minor percentage (3 to 7 percent) of RAP consists of hardened asphalt cement. Consequently, the overall chemical composition of RAP is essentially similar to that of the naturally occurring aggregate that is its principal constituent.
- b. Asphalt cement is made up of mainly high molecular weight aliphatic hydrocarbon compounds, but also small concentrations of other materials such as sulfur, nitrogen, and polycyclic hydrocarbons (aromatic and/or naphthenic) of very low chemical reactivity. Asphalt cement is a combination of asphaltenes and maltenes (resins and oils). Asphaltenes are more viscous than either resins or oils and play a major role in determining asphalt viscosity. Oxidation of aged asphalt causes the oils to convert to resins and the resins to convert to asphaltenes, resulting in age hardening and a higher viscosity binder.

4. Mechanical Properties

- a. The mechanical properties of RAP depend on the original asphalt pavement type, the method(s) utilized to recover the material, and the degree of processing necessary to prepare the RAP for a particular application. Since most RAP is recycled back into pavements, there is a general lack of data pertaining to the mechanical properties for RAP in other possible applications.
- b. The compacted unit weight of RAP will decrease with increasing unit weight, with maximum dry density values reported to range from 1600 kg/m³ (100 lb/ft³) to 2000 kg/m³ (125 lb/ft³). California Bearing Ratio (CBR) values for RAP material containing trap rock aggregate have been reported in the 20 to 25 percent range. However, when RAP is blended with natural aggregates for use in granular base, the asphalt cement in the RAP has a significant strengthening effect over time, such that specimens containing 40 percent RAP have produced CBR values exceeding 150 after 1 week.
- c. Table 2 provides a summary of the mechanical properties of RAP discussed in the preceding paragraphs.

1.1 GENERAL

A. Definitions

1. General: Basic Contract definitions are included in the Conditions of the Contract.
2. "Approved": When used to convey Architect's action on Contractor's submittals, applications, and requests, "approved" is limited to Architect's duties and responsibilities as stated in the Conditions of the Contract.
3. "Directed": A command or instruction by Architect. Other terms including "requested," "authorized," "selected," "required," and "permitted" have the same meaning as "directed."
4. "Indicated": Requirements expressed by graphic representations or in written form on Drawings, in Specifications, and in other Contract Documents. Other terms including "shown," "noted," "scheduled," and "specified" have the same meaning as "indicated."
5. "Regulations": Laws, ordinances, statutes, and lawful orders issued by authorities having jurisdiction, and rules, conventions, and agreements within the construction industry that control performance of the Work.
6. "Furnish": Supply and deliver to Project site, ready for unloading, unpacking, assembly, installation, and similar operations.
7. "Install": Operations at Project site including unloading, temporarily storing, unpacking, assembling, erecting, placing, anchoring, applying, working to dimension, finishing, curing, protecting, cleaning, and similar operations.
8. "Provide": Furnish and install, complete and ready for the intended use.
9. "Project Site": Space available for performing construction activities. The extent of Project site is shown on Drawings and may or may not be identical with the description of the land on which Project is to be built.

B. Industry Standards

1. Applicability of Standards: Unless the Contract Documents include more stringent requirements, applicable construction industry standards have the same force and effect as if bound or copied directly into the Contract Documents to the extent referenced. Such standards are made a part of the Contract Documents by reference.
2. Publication Dates: Comply with standards in effect as of date of the Contract Documents unless otherwise indicated.
3. Copies of Standards: Each entity engaged in construction on Project should be familiar with industry standards applicable to its construction activity. Copies of applicable standards are not bound with the Contract Documents.
 - a. Where copies of standards are needed to perform a required construction activity, obtain copies directly from publication source.

C. Abbreviations And Acronyms

1. Industry Organizations: Where abbreviations and acronyms are used in Specifications or other Contract Documents, they shall mean the recognized name of the entities in the following list. Names, telephone numbers, and Web sites are subject to change and are believed to be accurate and up-to-date as of the date of the Contract Documents.

SECTION 01 50 00 00 - TEMPORARY FACILITIES AND UTILITIES

PART 1 GENERAL

1.01 GENERAL

- A. Description
 1. Provide and maintain temporary utilities for construction operations and related necessary temporary structures. Remove them when they are no longer needed.
 2. Contractor to pay for connections to water and electricity for Project.
 3. University does not guarantee amounts of water and electricity available from existing University's sources, nor will University be responsible for interruptions in service.
- B. Requirements of Regulatory Agencies
 1. Install and use temporary utilities in accordance with the following:
 - a. National Electric Code.
 - b. Federal, state, and local codes and regulations.
 - c. Utility company requirements.
 - d. CAC Title 8, Chapter 4, Industrial Safety.
 - e. CAC Title 24, Subchapter 7, General Safety Orders.
 - f. ANSI Standards: Comply with applicable provisions of ANSI A10- Series standards on construction safety, including A10.3, A10.4, A10.5, A10.6, A10.7, A10.8, A10.9, A10.10, A10.11, A10.12, A10.13, A10.14, A10.15, A10.17, A10.18, A10.20, and A10.22.
 - g. NFPA: Comply with NFPA 241 "Building Construction and Demolition Operations."
- C. Communications: The following will not be provided by the University:
 1. Telephones
 2. Facsimile Machines
 3. Duplicating Machines

1.02 DELIVERY, STORAGE, AND HANDLING

- A. Comply with minimum requirements specified in Section 01600 - Material and Equipment.

PART 2 PRODUCTS

2.01 MATERIALS

- A. Materials may be new or used, but shall be adequate for the required purposes. Their use and methods of installation shall not create unsafe conditions or violate requirements of Applicable Code Requirements.
- B. Construction materials are to be non-combustible. Polyethylene is to be fire-retardant reinforced with glass fibers and listed by Underwriters Laboratories.
- C. Temporary Construction Facilities (Barriers in Exit Corridors):
 1. Barriers must be constructed of fire retardant treated plywood, gypsum wall board, non-combustible plastic film on metal studs, or a combination of these materials to create a one-hour fire-rated assembly. Plastic non-combustible material must be clearly marked as such.
 2. Barriers must be installed to insure that a minimum of 48" clear corridor width is maintained. Exceptions to this must be specifically approved by State Fire Marshal.
 3. All barriers must be constructed from the floor to the ceiling.
 4. Access doors through barriers must have a sign indicating construction. Doors must be maintained in the closed position or equipped with a self-closing device.
 - a. Door and frames shall be hollow metal with fire resistive labels. Door shall be equipped with a self-closing device. Install a sign on the door indicating "Construction Area".
 - b. Side exposed to public shall be taped, topped and sanded smooth and painted to match adjacent surfaces. Door and frame shall be painted.

01 - General Requirements

5. Barriers constructed to control dust and/or vapors are to be constructed in conformance with the above, and the following:
 - a. Only non-combustible plastic film may be used. This film must be clearly marked as non-combustible.
 - b. All plastic film must be securely attached to or placed entirely on the construction side of the barrier.
 6. Barriers which must remain in place more than 30 days must receive specific approval from State Fire Marshal.
- D. Weatherproof Enclosures:
1. Provide temporary enclosures where shown and where reasonably required to ensure adequate workmanship with protection from the weather.
- E. Barricades:
1. Ensure a minimum width of 60 inches is maintained in exit ways at the location of installed barricades. The minimum width is to be maintained at 72 inches in an exit corridor where a bed or litter patient would occupy the area. Contact the University's Representative prior to the installation of barricades if it is determined that the required minimum width of exit ways cannot be provided.
 2. Provide full height work area enclosure barriers of non-combustible construction using 1-hour fire resistive wall construction materials and installation methods as detailed on Drawings, with carpeted entrance vestibules. Materials to include the following:
 - a. Studs: Metal, 3-5/8 inches wide, unless directed otherwise.
 - b. Gypsum Board: 5/8 inch fire-rated, both sides.
 - c. Insulation Batts: R-11, 3-1/2 inch.
 - d. Sealer: Masking tape, 3-inch minimum wide. Fire-tape all joints except top and bottom joints.
 3. Pre-cut materials for barricades in unoccupied areas.
 4. Provide temporary visqueen containment around construction of new barricade.
 5. Powder-driven fasteners are not allowed except at partition tracks where low velocity fasteners are specified.
 6. Doors:
 - a. Wood: Solid core, 20-minute fire resistive, unless otherwise noted. Minimum width, 3 feet.
 - b. Frames: Metal.
 - c. Hardware:
 - 1) Locksets: Schlage, to accept typical University cylinders.
 - 2) Cylinders: Provided by the University, installed by Contractor.
 - 3) Butts: Minimum 1-1/2 pair.
 - 4) Closers.
 - 5) Weather-stripping: Sufficient to prevent flow of dust and smoke.
 7. Color: Paint surfaces exposed to public with doors and frames to match existing doors in immediate proximity.
- F. Temporary Electricity:
1. Electricity may be taken from University's system in quantities and at times as available. If this is done, provide all equipment, including metering, connections, transformers, and other materials necessary for extending the utility lines to where they will be used. Coordinate the installation with University's Representative. Pay for connections and removal of connections to the local water and power mains.
 2. No charge will be made to Contractor for water and electricity.
- G. Temporary Heat and Ventilation
1. Provide temporary heat and ventilation as required to maintain adequate environmental conditions to meet specified minimum conditions for installation of materials; and to protect equipment, materials, and finishes from damage due to temperature or humidity.
 2. Provide adequate forced ventilation of enclosed areas to cure installed materials, to prevent excessive humidity, and to prevent hazardous accumulations of dust, fumes, vapors, or gases.

- H. Temporary Telephone Service
 - 1. Make request to University's Representative for a direct line telephone service at the Project site for the use of personnel and employees. Cell phones are acceptable for communication only:
 - a. One direct-line telephone in Contractor's field office. Provide copy/fax machine.
- I. Temporary Water
 - 1. Install piping with taps located so that water is available throughout the Project site by the use of hoses. Protect piping and fittings against freezing.
 - 2. Provide water for human consumption in accordance with regulatory requirements for potable water.
 - 3. Maintain drains, and temporary connecting drains, in a clean, non-clogged condition during construction period.
- J. Temporary Sanitary Facilities:
 - 1. Contractor's personnel can use existing public toilets nearest the work site for their intended use. Contractor personnel shall not use them for general construction cleaning, i.e.: cleaning painting tools, etc. nor unduly trash the areas. The University, at its option, may charge back at the then current recharge rate, to the project for repairs and cleaning services required in these restrooms due to the use by construction personnel.
- K. Temporary Fire Protection
 - 1. Provide and maintain fire protection equipment including extinguishers, fire hoses, and other equipment as necessary for proper fire protection during the course of the Work.
 - 2. Use fire protection equipment only for fighting fires.
 - 3. Locate fire extinguishers in field offices, storage sheds, tool houses, other temporary buildings, and throughout the Project site.
 - 4. Assign a qualified person with authority to maintain fire protection equipment, institute fire prevention measures, and direct the prompt removal of combustible and waste material.

2.02 CONTRACTOR'S FIELD OFFICE

- A. Contractor's Field Office Minimum Requirements: Provide a space within the Project Area for Contractor's personnel, providing a telephone, desk or table for reviewing data, and space adequate for storage of approved samples and construction documents.

PART 3 EXECUTION

3.01 EXECUTION

- A. General
 - 1. Comply with applicable requirements in the Mechanical and Electrical specifications.
 - 2. Maintain and operate systems to provide continuous service.
 - 3. Modify and extend systems as required.
 - 4. Removal and Reconditioning
 - 5. Remove all temporary services installed as a requirement of the Contract Documents. Restore utilities to their original condition at the completion of the Work.
 - 6. Legally and properly dispose of all debris resulting from removal and reconditioning operations.

3.02 REMOVAL AND REPAIRING

- A. See Section 01070 - Demolition, Cutting and Patching.

3.03 CLEANING

- A. See Section 01710 - Clean up and Disposal.

SECTION 01 51 13 00 - ELECTRICAL RENOVATION

1.1 DESCRIPTION OF WORK

- A. This specification covers the furnishing and installation of materials for electrical renovation. Products shall be as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

1.2 GENERAL

A. Quality Assurance

1. Regulatory Requirements: Comply with following:
 - a. Electrical: National Fire Protection Association (NFPA): NFPA 70 - National Electrical Code (NEC).
 - b. Accessibility:
 - 1) Architectural Barriers Act of 1968 as amended (42 USC 4151-4157) and HUD implementing regulations (24 CFR Part 40).
 - a) Uniform Federal Accessibility Standards (UFAS).
 - 2) Section 504 of the Rehabilitation Act of 1973 as amended (29 USC 794) and HUD implementing regulations 24 CFR Part 8.
 - 3) Fair Housing Accessibility Guidelines (24 CFR Chapter 1).
 - 4) Americans with Disabilities Act of 1990 (ADA) (42 USC §§ 12101, et seq.) and implementing regulations (28 CFR Part 35).

B. Project Conditions

1. Existing Conditions: Buildings will be occupied during construction. See Division 1 Section "Summary of Work." Do not interfere with use of occupied portions of building. Maintain free and safe passage to and from occupied areas.

C. Scheduling And Sequencing

1. Scheduling and Completion: Comply with requirements of Detailed Scope of Work.

D. Alterations, Cutting And Protection

1. Protection: Protect existing finishes, equipment, utilities and adjacent work, which is scheduled to remain, from damage.
2. Existing Operating Facilities: Confine operations to immediate vicinity of new work and do not interfere with or obstruct ingress or egress to and from adjacent facilities.

1.3 PRODUCTS

A. Materials

1. Electrical Materials and Devices: Comply with NFPA 70 (NEC):
 - a. Boxes: Galvanized steel, not less than 1.6 mm (0.0625 inch) thickness (NEC 370-20) grounded in accordance with NEC, Article 250, suitable for recess mounting.
 - 1) Provide boxes of appropriate shape and size for intended purpose.
 - b. Devices:
 - 1) Duplex Receptacles: 15 A or 20 A 115 V, UL Listed with screw side connections and corrugated bearing pads.
 - a) GFCI Outlets: 115 V, 60 Hz, 15/20 A rating, UL Listed.
 - 2) Switches: 15 A, 115 V, single pole, single throw switch, UL Listed, with side screw connections and corrugated bearing pads.

- a) Garbage Disposal: Heavy duty, 120/277 VAC, 60 Hz, single pole, single throw, 20 A rate, UL listed and CSA certified.
- 3) Cover Plates: Smooth plastic in color to match existing.
- c. Wiring: Insulated wire, Type NM 600 V with ground wire, sized as appropriate for intended purpose and in accordance with NEC.
 - 1) Aluminum Wire: Not allowed unless existing wiring is aluminum.
 - 2) Provide necessary fittings in accordance with NEC.

1.4 EXECUTION

A. Examination

- 1. Units, Spaces and Areas to be Renovated: Inspect to become familiar with existing conditions and to take measurements which are necessary for renovation work to be completed in accordance with contract requirements.
 - a. Carefully inspect condition of existing spaces including, but not limited to walls, floors, plumbing, electrical, etc. as essential to successful completion of renovation work.
 - b. Survey each space and verify dimensions for work.

B. Preparation

- 1. Building Occupation: Carry out renovation work to cause as little inconvenience to occupants as possible. See Division 1 Section "Summary of Work."
- 2. Protection: Protect and be responsible for existing buildings, facilities, utilities, and improvements within areas of construction operations.
 - a. Tenant's Property: Be responsible for any damage or loss to residents' property and to other work. Replace any material, which, in opinion of the Owner, has become damaged to extent that it could not be restored to its original condition.
 - b. Take precautions to protect residents and public from injury from construction operations.

C. Laying Out Work

- 1. Discrepancies: Verify dimensions and elevations indicated in layout of existing work.
 - a. Prior to commencing work, carefully compare and check Drawings (if any), for discrepancies in locations or elevations of work to be executed.
 - b. Refer discrepancies among Drawings (if any), Specifications and existing conditions to the Owner for adjustment before work affected is performed.
 - 1) Failure to make such notification shall place responsibility on Contractor to carry out work in satisfactory, workmanlike manner.
- 2. Contractor: Responsible for location and elevation of construction contemplated by Construction Documents.

D. Location Of Equipment And Piping

- 1. Drawings (if any) indicating location of equipment, piping, ductwork, etc. are diagrammatic and job conditions shall not always permit their installation in location shown. When this situation occurs, bring condition to the Owner's attention immediately. Relocation will be determined in joint conference.
- 2. Contractor: Do not relocate any items without first obtaining the Owner's acceptance. Remove and relocate such relocated items at own expense if so directed.

E. Electrical Work

- 1. General: Install boxes, wiring, and devices as indicated and required to connect and control electrical devices in accordance with NFPA 70 (NEC).
 - a. Boxes: Solidly anchor to framing or blocking.
- 2. Removing Electrical Switch or Duplex Outlet (Non-Hazardous Locations):
 - a. Box to Remain:
 - 1) Remove electrical device; cap hot and neutral with set-screw wire connectors.

- 2) Attach ground wire to remaining box with solid screw attachment.
 - 3) Provide and install natural finish aluminum blank cover plate with screw fasteners integral to match size of box remaining.
 - b. Box to be removed:
 - 1) Remove electrical device and box and pull wire out of wall back to first circuit panel, disconnecting from circuit panel.
 - 2) Patch and repair hole in partition to match existing.
 3. Garbage Disposal Electrical Hook-up: See Section "Plumbing." Comply with NFPA 70 (NEC):
 - a. Wiring: Install from disposal through concealed spaces to house panel, anchoring wire, and providing necessary fittings.
 - b. Switch: Install above counter top backsplash.
 4. Range Hood Electrical Hook-up: See Section "Residential Appliances." Comply with NFPA 70 (NEC):
 - a. Electric service: Install insulated wire from range hood through concealed spaces to house panel, anchoring wire, and providing necessary fittings.
 5. Water Heater Electrical Hook-up: See Division 15 Section "Domestic Water Heaters." Comply with NFPA 70 (NEC).
 6. Furnace Electrical Hook-up: See Section "Furnaces." Comply with NFPA 70 (NEC).
 7. Smoke Detector Electrical Hook-up: See "Fire Alarm." Comply with NFPA 70 (NEC).
- F. Integrating Existing Work
1. Protection: Protect existing improvements from damage.
 - a. Where new work is to be connected to existing work, exercise special care not to disturb or damage existing work more than necessary.
 - b. Damaged Work: Replace, repair and restored to its original condition at no cost to the Owner.

SECTION 01 52 13 00 - TEMPORARY FACILITIES AND CONTROLS

1.1 GENERAL

A. Summary

1. This Section includes requirements for temporary utilities, support facilities, and security and protection facilities.

B. Definitions

1. Permanent Enclosure: As determined by the Owner, permanent or temporary roofing is complete, insulated, and weathertight; exterior walls are insulated and weathertight; and all openings are closed with permanent construction or substantial temporary closures.

C. Use Charges

1. General: Cost or use charges for temporary facilities shall be included in the Contract Sum. Allow other entities to use temporary services and facilities without cost, including, but not limited to, the Owner's construction forces, the Owner, occupants of Project, testing agencies, and authorities having jurisdiction.
2. Water Service: Water from the Owner's existing water system is available for use without metering and without payment of use charges. Provide connections and extensions of services as required for construction operations.
3. Electric Power Service: Electric power from the Owner's existing system is available for use without metering and without payment of use charges. Provide connections and extensions of services as required for construction operations.

D. Submittals

1. Site Plan: Show temporary facilities, utility hookups, staging areas, and parking areas for construction personnel.

E. Quality Assurance

1. Electric Service: Comply with NECA, NEMA, and UL standards and regulations for temporary electric service. Install service to comply with NFPA 70.
2. Tests and Inspections: Arrange for authorities having jurisdiction to test and inspect each temporary utility before use. Obtain required certifications and permits.

F. Project Conditions

1. Temporary Use of Permanent Facilities: Installer of each permanent service shall assume responsibility for operation, maintenance, and protection of each permanent service during its use as a construction facility before the Owner's acceptance, regardless of previously assigned responsibilities.

1.2 PRODUCTS

A. Materials

1. Pavement: Comply with Division 32 Section(s) "Asphalt Paving" OR "Concrete Paving", **as directed**.
2. Chain-Link Fencing: Minimum **2-inch (50-mm)**, **0.148-inch- (3.76-mm-)** thick, galvanized steel, chain-link fabric fencing; minimum **6 feet (1.8 m)** high with galvanized steel pipe posts; minimum **2-3/8-inch- (60-mm-)** OD line posts and **2-7/8-inch- (73-mm-)** OD corner and pull posts, with **1-5/8-inch- (42-mm-)** OD top rails **OR** with galvanized barbed-wire top strand, **as directed**.
3. Portable Chain-Link Fencing: Minimum **2-inch (50-mm)**, 9-gage, galvanized steel, chain-link fabric fencing; minimum **6 feet (1.8 m)** high with galvanized steel pipe posts; minimum **2-3/8-inch- (60-mm-)** OD line posts and **2-7/8-inch- (73-mm-)** OD corner and pull posts, with **1-5/8-inch- (42-**

mm-) OD top and bottom rails. Provide concrete **OR** galvanized steel, **as directed**, bases for supporting posts.

4. Wood Enclosure Fence: Plywood, **6 feet (1.8 m) OR 8 feet (2.4 m)**, **as directed**, high, framed with four **2-by-4-inch (50-by-100-mm)** rails, with preservative-treated wood posts spaced not more than **8 feet (2.4 m)** apart.
5. Lumber and Plywood: Comply with requirements in Division 06 Section(s) "Rough Carpentry" OR "Miscellaneous Rough Carpentry", **as directed**.
6. Gypsum Board: Minimum **1/2 inch (12.7 mm)** thick by **48 inches (1219 mm)** wide by maximum available lengths; regular-type panels with tapered edges. Comply with ASTM C 36/C 36M.
7. Insulation: Unfaced mineral-fiber blanket, manufactured from glass, slag wool, or rock wool; with maximum flame-spread and smoke-developed indexes of 25 and 50, respectively.
8. Paint: Comply with requirements in Division 09.

B. Temporary Facilities

1. Field Offices, General: Prefabricated or mobile units with serviceable finishes, temperature controls, and foundations adequate for normal loading.
2. Common-Use Field Office: Of sufficient size to accommodate needs of construction personnel. Keep office clean and orderly. Furnish and equip offices as follows:
 - a. Furniture required for Project-site documents including file cabinets, plan tables, plan racks, and bookcases.
 - b. Conference room of sufficient size to accommodate meetings of 10 individuals. Provide electrical power service and 120-V ac duplex receptacles, with not less than 1 receptacle on each wall. Furnish room with conference table, chairs, and **4-foot- (1.2-m-)** square tack board.
 - c. Drinking water and private toilet.
 - d. Coffee machine and supplies.
 - e. Heating and cooling equipment necessary to maintain a uniform indoor temperature of **68 to 72 deg F (20 to 22 deg C)**.
 - f. Lighting fixtures capable of maintaining average illumination of **20 fc (215 lx)** at desk height.
3. Storage and Fabrication Sheds: Provide sheds sized, furnished, and equipped to accommodate materials and equipment for construction operations.
 - a. Store combustible materials apart from building.

C. Equipment

1. Fire Extinguishers: Portable, UL rated; with class and extinguishing agent as required by locations and classes of fire exposures.
2. HVAC Equipment: Unless the Owner authorizes use of permanent HVAC system, provide vented, self-contained, liquid-propane-gas or fuel-oil heaters with individual space thermostatic control.
 - a. Use of gasoline-burning space heaters, open-flame heaters, or salamander-type heating units is prohibited.
 - b. Heating Units: Listed and labeled for type of fuel being consumed, by a testing agency acceptable to authorities having jurisdiction, and marked for intended use.
 - c. Permanent HVAC System: If the Owner authorizes use of permanent HVAC system for temporary use during construction, provide filter with MERV of 8 at each return air grille in system and remove at end of construction.

1.3 EXECUTION

A. Installation, General

1. Locate facilities where they will serve Project adequately and result in minimum interference with performance of the Work. Relocate and modify facilities as required by progress of the Work.

- a. For greenfield sites if reduced site disturbance is required for LEED-NC Credit SS 5.1: Locate facilities to limit site disturbance as specified in General Requirements.
 2. Provide each facility ready for use when needed to avoid delay. Do not remove until facilities are no longer needed or are replaced by authorized use of completed permanent facilities.
- B. Temporary Utility Installation
1. General: Install temporary service or connect to existing service.
 - a. Arrange with utility company, the Owner, and existing users for time when service can be interrupted, if necessary, to make connections for temporary services.
 2. Sewers and Drainage: Provide temporary utilities to remove effluent lawfully.
 - a. Connect temporary sewers to municipal system **OR** private system indicated, **as directed**, as directed by authorities having jurisdiction.
 3. Water Service: Install water service and distribution piping in sizes and pressures adequate for construction.
OR
Water Service: Use of the Owner's existing water service facilities will be permitted, as long as facilities are cleaned and maintained in a condition acceptable to the Owner. At Final Completion, restore these facilities to condition existing before initial use.
 - a. Where installations below an outlet might be damaged by spillage or leakage, provide a drip pan of suitable size to minimize water damage. Drain accumulated water promptly from pans.
 4. Sanitary Facilities: Provide temporary toilets, wash facilities, and drinking water for use of construction personnel. Comply with authorities having jurisdiction for type, number, location, operation, and maintenance of fixtures and facilities.
 - a. Toilets: Use of the Owner's existing toilet facilities will be permitted, as long as facilities are cleaned and maintained in a condition acceptable to the Owner. At Final Completion, restore these facilities to condition existing before initial use.
 5. Heating **OR** Heating and Cooling, **as directed**: Provide temporary heating **OR** heating and cooling, **as directed**, required by construction activities for curing or drying of completed installations or for protecting installed construction from adverse effects of low temperatures or high humidity. Select equipment that will not have a harmful effect on completed installations or elements being installed.
 6. Ventilation and Humidity Control: Provide temporary ventilation required by construction activities for curing or drying of completed installations or for protecting installed construction from adverse effects of high humidity. Select equipment that will not have a harmful effect on completed installations or elements being installed. Coordinate ventilation requirements to produce ambient condition required and minimize energy consumption.
 7. Electric Power Service: Use of the Owner's existing electric power service will be permitted, as long as equipment is maintained in a condition acceptable to the Owner.
OR
Electric Power Service: Provide electric power service and distribution system of sufficient size, capacity, and power characteristics required for construction operations.
 - a. Install electric power service overhead **OR** underground, **as directed**, unless otherwise indicated.
 - b. Connect temporary service to the Owner's existing power source, as directed by the Owner.
 8. Lighting: Provide temporary lighting with local switching that provides adequate illumination for construction operations, observations, inspections, and traffic conditions.
 - a. Install and operate temporary lighting that fulfills security and protection requirements without operating entire system.
 - b. Install lighting for Project identification sign.
 9. Telephone Service: Provide temporary telephone service in common-use facilities for use by all construction personnel. Install one telephone line for each field office.
 - a. Provide additional telephone lines for the following:
 - 1) Provide a dedicated telephone line for each facsimile machine and computer in each field office.

- b. At each telephone, post a list of important telephone numbers.
 - 1) Police and fire departments.
 - 2) Ambulance service.
 - 3) Contractor's home office.
 - 4) the Owner's office.
 - 5) the Owner's office.
 - 6) Principal subcontractors' field and home offices.
 - c. Provide superintendent with cellular telephone or portable two-way radio for use when away from field office.
10. Electronic Communication Service: Provide temporary electronic communication service, including electronic mail, in common-use facilities.
- a. Provide DSL **OR** T-1 line, **as directed**, in primary field office.
- C. Support Facilities Installation
- 1. General: Comply with the following:
 - a. Provide incombustible construction for offices, shops, and sheds located within construction area or within **30 feet (9 m)** of building lines. Comply with NFPA 241.
 - b. Maintain support facilities until near Final Completion. Remove before Final Completion. Personnel remaining after Final Completion will be permitted to use permanent facilities, under conditions acceptable to the Owner.
 - 2. Temporary Roads and Paved Areas: Construct and maintain temporary roads and paved areas adequate for construction operations. Locate temporary roads and paved areas as indicated **OR** within construction limits indicated, **as directed**, on Drawings.
 - a. Provide dust-control treatment that is nonpolluting and nontracking. Reapply treatment as required to minimize dust.
- OR**
- 3. Temporary Roads and Paved Areas: Construct and maintain temporary roads and paved areas adequate for construction operations. Locate temporary roads and paved areas in same location as permanent roads and paved areas. Extend temporary roads and paved areas, within construction limits indicated, as necessary for construction operations.
 - a. Coordinate elevations of temporary roads and paved areas with permanent roads and paved areas.
 - b. Prepare subgrade and install subbase and base for temporary roads and paved areas according to Division 31 Section "Earth Moving".
 - c. Recondition base after temporary use, including removing contaminated material, regrading, proofrolling, compacting, and testing.
 - d. Delay installation of final course of permanent hot-mix asphalt pavement until immediately before Final Completion. Repair hot-mix asphalt base-course pavement before installation of final course according to Division 32 Section "Asphalt Paving".
 - 4. Traffic Controls: Comply with requirements of authorities having jurisdiction.
 - a. Protect existing site improvements to remain including curbs, pavement, and utilities.
 - b. Maintain access for fire-fighting equipment and access to fire hydrants.
 - 5. Parking: Provide temporary **OR** Use designated areas of the Owner's existing, **as directed**, parking areas for construction personnel.
 - 6. Dewatering Facilities and Drains: Comply with requirements of authorities having jurisdiction. Maintain Project site, excavations, and construction free of water.
 - a. Dispose of rainwater in a lawful manner that will not result in flooding Project or adjoining properties nor endanger permanent Work or temporary facilities.
 - b. Remove snow and ice as required to minimize accumulations.
 - 7. Project Identification and Temporary Signs: Provide Project identification and other signs as indicated on Drawings, **OR as directed**. Install signs where indicated to inform public and individuals seeking entrance to Project. Unauthorized signs are not permitted.
 - a. Provide temporary, directional signs for construction personnel and visitors.
 - b. Maintain and touchup signs so they are legible at all times.

8. Waste Disposal Facilities: Provide waste-collection containers in sizes adequate to handle waste from construction operations. Comply with requirements of authorities having jurisdiction. Comply with General Requirements for progress cleaning requirements.
 9. Lifts and Hoists: Provide facilities necessary for hoisting materials and personnel.
 - a. Truck cranes and similar devices used for hoisting materials are considered "tools and equipment" and not temporary facilities.
 10. Temporary Elevator Use: Refer to Division 14 for temporary use of new elevators.
 11. Existing Elevator Use: Use of the Owner's existing elevators will be permitted, as long as elevators are cleaned and maintained in a condition acceptable to the Owner. At Final Completion, restore elevators to condition existing before initial use, including replacing worn cables, guide shoes, and similar items of limited life.
 - a. Do not load elevators beyond their rated weight capacity.
 - b. Provide protective coverings, barriers, devices, signs, or other procedures to protect elevator car and entrance doors and frame. If, despite such protection, elevators become damaged, engage elevator Installer to restore damaged work so no evidence remains of correction work. Return items that cannot be refinished in field to the shop, make required repairs and refinish entire unit, or provide new units as required.
 12. Temporary Stairs: Until permanent stairs are available, provide temporary stairs where ladders are not adequate.
 13. Existing Stair Usage: Use of the Owner's existing stairs will be permitted, as long as stairs are cleaned and maintained in a condition acceptable to the Owner. At Final Completion, restore stairs to condition existing before initial use.
 - a. Provide protective coverings, barriers, devices, signs, or other procedures to protect stairs and to maintain means of egress. If, despite such protection, stairs become damaged, restore damaged areas so no evidence remains of correction work.
 14. Temporary Use of Permanent Stairs: Cover finished, permanent stairs with protective covering of plywood or similar material so finishes will be undamaged at time of acceptance.
- D. Security And Protection Facilities Installation
1. Environmental Protection: Provide protection, operate temporary facilities, and conduct construction in ways and by methods that comply with environmental regulations and that minimize possible air, waterway, and subsoil contamination or pollution or other undesirable effects.
 2. Temporary Erosion and Sedimentation Control: Provide measures to prevent soil erosion and discharge of soil-bearing water runoff and airborne dust to adjacent properties and walkways, according to requirements of authorities having jurisdiction.
 - a. Inspect, repair, and maintain erosion- and sedimentation-control measures during construction until permanent vegetation has been established.
 3. Stormwater Control: Comply with authorities having jurisdiction. Provide barriers in and around excavations and subgrade construction to prevent flooding by runoff of stormwater from heavy rains.
 4. Tree and Plant Protection: Install temporary fencing located as indicated or outside the drip line of trees to protect vegetation from damage from construction operations. Protect tree root systems from damage, flooding, and erosion.
 5. Pest Control: Engage pest-control service to recommend practices to minimize attraction and harboring of rodents, roaches, and other pests and to perform extermination and control procedures at regular intervals so Project will be free of pests and their residues at Final Completion. Obtain extended warranty for the Owner. Perform control operations lawfully, using environmentally safe materials.
 6. Site Enclosure Fence: Before construction operations begin **OR** When excavation begins, **as directed**, furnish and install site enclosure fence in a manner that will prevent people and animals from easily entering site except by entrance gates.
 - a. Extent of Fence: As required to enclose entire Project site or portion determined sufficient to accommodate construction operations **OR** As indicated on Drawings, **as directed**.
 - b. Maintain security by limiting number of keys and restricting distribution to authorized personnel. Provide the Owner with one set of keys, **as directed**.

01 - General Requirements

7. Security Enclosure and Lockup: Install substantial temporary enclosure around partially completed areas of construction. Provide lockable entrances to prevent unauthorized entrance, vandalism, theft, and similar violations of security.
 8. Barricades, Warning Signs, and Lights: Comply with requirements of authorities having jurisdiction for erecting structurally adequate barricades, including warning signs and lighting.
 9. Covered Walkway: Erect structurally adequate, protective, covered walkway for passage of individuals along adjacent public street(s). Coordinate with entrance gates, other facilities, and obstructions. Comply with regulations of authorities having jurisdiction and requirements indicated on Drawings, **OR as directed**.
 - a. Construct covered walkways using scaffold or shoring framing.
 - b. Provide wood-plank overhead decking, protective plywood enclosure walls, handrails, barricades, warning signs, lights, safe and well-drained walkways, and similar provisions for protection and safe passage.
 - c. Extend back wall beyond the structure to complete enclosure fence.
 - d. Paint and maintain in a manner approved by the Owner.
 10. Temporary Enclosures: Provide temporary enclosures for protection of construction, in progress and completed, from exposure, foul weather, other construction operations, and similar activities. Provide temporary weathertight enclosure for building exterior.
 - a. Where heating or cooling is needed and permanent enclosure is not complete, insulate temporary enclosures.
 11. Temporary Partitions: Provide floor-to-ceiling dustproof partitions to limit dust and dirt migration and to separate areas occupied by the Owner and tenants from fumes and noise.
 - a. Construct dustproof partitions with gypsum wallboard with joints taped on occupied side, and fire-retardant plywood on construction operations side.
 - b. If containment of airborne particles and dust generated by construction activities is critical to occupants of other spaces in building, e.g., occupied healthcare facilities: Construct dustproof partitions with 2 layers of **3-mil (0.07-mm)** polyethylene sheet on each side. Cover floor with 2 layers of **3-mil (0.07-mm)** polyethylene sheet, extending sheets **18 inches (460 mm)** up the sidewalls. Overlap and tape full length of joints. Cover floor with fire-retardant plywood.
 - 1) Construct vestibule and airlock at each entrance through temporary partition with not less than **48 inches (1219 mm)** between doors. Maintain water-dampened foot mats in vestibule.
 - c. Insulate partitions to provide noise protection to occupied areas.
 - d. Seal joints and perimeter. Equip partitions with dustproof doors and security locks.
 - e. Protect air-handling equipment.
 - f. Weather strip openings.
 - g. Provide walk-off mats at each entrance through temporary partition.
 12. Temporary Fire Protection: Install and maintain temporary fire-protection facilities of types needed to protect against reasonably predictable and controllable fire losses. Comply with NFPA 241.
 - a. Prohibit smoking in hazardous fire-exposure **OR** construction, **as directed**, areas.
 - b. Supervise welding operations, combustion-type temporary heating units, and similar sources of fire ignition according to requirements of authorities having jurisdiction.
 - c. Develop and supervise an overall fire-prevention and -protection program for personnel at Project site. Review needs with local fire department and establish procedures to be followed. Instruct personnel in methods and procedures. Post warnings and information.
 - d. Provide temporary standpipes and hoses for fire protection. Hang hoses with a warning sign stating that hoses are for fire-protection purposes only and are not to be removed. Match hose size with outlet size and equip with suitable nozzles.
- E. Operation, Termination, And Removal
1. Supervision: Enforce strict discipline in use of temporary facilities. To minimize waste and abuse, limit availability of temporary facilities to essential and intended uses.
 2. Maintenance: Maintain facilities in good operating condition until removal.

- a. Maintain operation of temporary enclosures, heating, cooling, humidity control, ventilation, and similar facilities on a 24-hour basis where required to achieve indicated results and to avoid possibility of damage.
3. Operate Project-identification-sign lighting daily from dusk until 12:00 midnight.
4. Temporary Facility Changeover: Do not change over from using temporary security and protection facilities to permanent facilities until Final Completion.
5. Termination and Removal: Remove each temporary facility when need for its service has ended, when it has been replaced by authorized use of a permanent facility, or no later than Final Completion. Complete or, if necessary, restore permanent construction that may have been delayed because of interference with temporary facility. Repair damaged Work, clean exposed surfaces, and replace construction that cannot be satisfactorily repaired.
 - a. Materials and facilities that constitute temporary facilities are property of Contractor. the Owner reserves right to take possession of Project identification signs.
 - b. Remove temporary paving not intended for or acceptable for integration into permanent paving. Where area is intended for landscape development, remove soil and aggregate fill that do not comply with requirements for fill or subsoil. Remove materials contaminated with road oil, asphalt and other petrochemical compounds, and other substances that might impair growth of plant materials or lawns. Repair or replace street paving, curbs, and sidewalks at temporary entrances, as required by authorities having jurisdiction.
 - c. At Final Completion, clean and renovate permanent facilities used during construction period. Comply with final cleaning requirements specified in General Requirements

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 52 19 00 - CONSTRUCTION WASTE MANAGEMENT

PART 1 GENERAL

1.01 SUMMARY

- A Section Includes: Requirements for diversion of construction and demolition debris from landfill.
 - 1. The University has established that this Project shall generate the least amount of waste possible and that processes that ensure the generation of as little waste as possible due to over-packaging, error, poor planning, breakage, mishandling, contamination, or other factors shall be employed.
 - 2. Of the inevitable waste that is generated, as many of the waste materials as economically feasible shall be reused, salvaged, or recycled. Waste disposal in landfills shall be minimized.
 - 3. Contractors are encouraged to use waste hauling companies that separate recyclable materials. Contractor shall work with their waste haulers in providing other recycling containers as appropriate.

1.02 REFERENCES

1.03 DEFINITIONS

- A "Conversion Rate" means the rate set forth in the standardized Conversion Rate Table approved by the City where the Project is located for use in estimating the weight of materials identified in the Waste Management Plan. If the City or local jurisdiction does not have an approved Conversion Rate Table, Contractor may use attached Conversion Rate Table estimates.
- B "Divert" means to use material for any purpose other than disposal in a landfill or transfer facility for disposal.
- C "Good Faith" shall be as defined by law.
- D "Net Cost" means that the following have been subtracted from the cost of separating and recycling:
 - 1. Revenue from the sale of recycled or salvaged materials.
 - 2. Landfill tipping fees saved due to diversion of materials from the landfill.
- E "Recycling Service" means an off-site service that provides processing of material and diversion from landfill.
- F "Hauler" means the entity that transports construction and demolition debris to either a landfill or a recycling service.

1.04 PERFORMANCE REQUIREMENT

- A Diversion Goals: Divert a minimum of 75 percent of total project construction and demolition waste from landfill.
- B Project Data: Submit specified Waste Management Plan using written and graphic representation to indicate how waste will be diverted from landfills.
- C Certification: Submit certification from recycling services that are not listed in "City Directory of Recycling Services for Companies that Recycle Construction & Demolition Debris", or in County Waste Management Authority's "Builders' Guide to Reuse and Recycling, A Directory for Construction and Demolition Materials", or local jurisdiction's directory.
- D Forms: Submit completed waste reduction forms, Appendix A of this Section, and other applicable documentation to University to show compliance with the waste diversion requirements. Submit forms at

completion of demolition work, at 50 percent completion of new construction, and at Substantial Completion. Submit along with monthly Application for Payment.

1.05 QUALITY ASSURANCE

- A Recycling Company Qualifications: Any of the following:
 - 1. Listed in Alameda County Waste Management Authority's "Builders' Guide to Reuse and Recycling, A Directory for Construction and Demolition Materials", latest edition.
 - 2 Listed as acceptable recycling service provider by City and County of San Francisco.
 - 3. Any recycling service that will certify in writing that accepted waste will be diverted from landfill, not dumped illegally, or dumped at sea.
- B Regulatory Requirements: Comply with construction and demolition waste recycling ordinance of City and County.
- C Approval of Waste Management Plan by the University's Representative is required before beginning on-site mobilization.

1.06 WASTE MANAGEMENT PLAN

- A Plan Development: Develop a plan for diverting the specified percentage of construction debris from landfill. Include in plan written and graphic information indicating how waste will be diverted from landfills.
 - 1. Include in plan both on-site recycling of construction debris and also off-site diversion from landfill.
 - 2. Submit plan within 10 calendar days after receipt of Notice to Proceed, or prior to any waste removal, whichever occurs sooner.
 - 3 Propose means and methods for collecting and separating each type of debris deemed reusable or recyclable.
 - 4 Schedule each item, and list the off-site recycling service and hauler of each designated debris item, who have agreed to accept and divert that item from landfill in the proposed quantities anticipated. List the service and hauler companies names, addresses, phone numbers, and persons contacted.
 - 5 Include a "good faith" estimate of each type of construction waste that would be generated if no diversion methods were implemented. Submit with calculations based upon weight of each material. The following items are subject to the "good faith" estimate and diversion requirement:
 - a Asphalt concrete.
 - b Portland cement concrete.
 - c Aggregates.
 - d Concrete masonry, brick and clay products.
 - e Clean earth fill.
 - f Wood products, including clean dimensional wood, palette wood, plywood, formwork, OSB, and particleboard.
 - g Metals, including banding, ductwork, flashing, piping, rebar, steel, iron, galvanized sheet steel, stainless steel, aluminum, copper, zinc, lead, brass, and bronze.
 - h Plant and tree trimmings (may be included in wood products if accepted by recycling service.
 - i Cardboard, paper products, and packaging.
 - j Mixed waste, including, but not necessarily limited to the following:
 - k Beverage containers.

- l Insulation.
- m Roofing.
- n Glass, excluding that used for containers.
- o Gypsum board.
- p Cement board.
- q Plastics, including ABS, PVC, and piping.
- r Latex paint.
- s Other materials.

6 Calculate quantities and convert volume measurements to weights in accordance with the Conversion Rate Table.

B Plan Implementation

- 1 Maintain log of each load, of each category item diverted from landfill. Log in separately debris sent to a Class III landfill and materials sent to recycling facilities.
 - a Include in log the type of load, load weight, name of hauling service, recycling service or landfill, and date accepted by recycling service or by landfill.
 - b University's Representative reserves the right to audit the log at any time. Retain and make available all weight tickets, copies of receipts, and invoices.
 - c Units of Measure: Use same units as stated in the approved plan "good faith" estimate of construction waste that would be generated if no remedial methods were implemented.

2 Material Handling

- a Separation Facilities
 - 1 Designate a specific area or areas on site to facilitate separation of materials for potential reuse, salvage, recycling, and return. Clearly mark bins for each category of waste.
 - 2 Keep waste bins and pile areas neat and clean. Do not contaminate non-recyclable waste with materials designated for reuse or recycling.
- b Environmental Controls During Handling, Storage, and Transport: Do not permit designated materials to become contaminated or to contaminate site or surrounding areas.

3 Training and Coordination

- a Manager: Contractor shall designate an on-site party (or parties) responsible for instructing workers and subcontractors, and overseeing and documenting results of the Waste Management Plan for the Project.
- b Distribution: Furnish copies of the Waste Management Plan to all on-site supervisors, each subcontractor, and the University's Representative.
- c Instruction: Provide on-site instruction of appropriate separation, handling, and recycling, salvage, reuse, and return methods to be used by all parties at the appropriate stages of the Project.

4 Meetings:

- a. Include Construction Waste Management on the agenda of meetings. Meetings shall include all subcontractors affected by the Waste Management Plan. At a minimum, discuss waste management goals and issues at the following meetings:

01 - General Requirements

- 1 Pre-bid meeting.
- 2 Pre-construction meeting.
- 3 Regularly scheduled jobsite meetings.
- 4 Pre-installation meetings.

C Hazardous Waste: Separate, store, and dispose of hazardous waste according to local regulations.

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION

A In purchasing any products or disposing of any demolition or construction waste, use products that support sustainability through environmentally responsible supplier production, product life cycle and recycling. Sustainable products should meet the requirements of the U.S. Green Building Council's LEED for Green Building Operations and Maintenance Program, 2009 Edition; specifically, Materials & Resources Credit 3, "Sustainable Purchasing – Facility Alterations and Additions" and disposal of debris should meet the requirements of Credit 9, "Solid Waste Management – Facility Alterations and Additions." Reference: www.usgbc.org/

APPENDIX A

CONTRACTOR'S WASTE MANAGEMENT PLAN

Many of the materials generated from this Project can be recycled. You are required to list materials that will be reused, recycled or disposed from this Project.

The required goal is to reuse or recycle at least 75 percent of Project demolition and construction waste.

Use tons or cubic yards to quantify total estimated waste and percentages for materials. Ask your hauler, recycler or site cleanup vendor to assist you with this plan. Receipts of all recycling and disposal shall be submitted prior to Project completion.

Project Name: _____

Location: _____

Building Type: _____

Square Footage: _____

Type of Project: New Construction Demolition

Type of Construction (wood frame, concrete, steel, etc.): _____

Applicant: _____ Phone: _____

Company Name: _____

See:

1. Conversion Rates Table – attached.
2. Sample Waste Management Plans – attached.
3. Directory of Recycling Services - call City for copy.
4. Builders Guide to Reuse and Recycling - call County for copy.

Submit this form and the applicable attached Waste Management Plans and Conversion Rate Table to University's Representative at pre-construction meeting.

APPENDIX A

CONVERSION RATES TABLE

The following conversion rates are estimates. The ranges vary widely, depending on how the materials are handled (compacted, loose, chipped, etc.). Use the conversion factors and receipts from previous projects to help you estimate the potential amount of materials and waste. Take into consideration the type and load of vehicles that will be used to haul the materials.

Ask your hauler or recycler to assist you in estimating these numbers.

Material	Lbs/cy	Tons/cy
Asphalt	1,400 lbs/cy	0.7 tons/cy
Cardboard	100 lbs/cy	0.05 tons/cy
Concrete	2,600 lbs/cy (Sources range from 1,000 to 4,000)	1.3 tons/cy
Drywall	700 lbs/cy	0.35 tons/cy
Wood (chipped)	300 - 650 lbs/cy	0.15 - 0.3 tons/cy
Mixed C & D Debris	900 lbs/cy	0.45 tons/cy
Mixed Waste/Trash	100 - 350 lbs/cy	0.5 - 0.175 tons/cy

APPENDIX A
DEMOLITION AND NEW CONSTRUCTION
WASTE DIVERSION RATE TABLE

Information provided is to be cumulative, project to date totals

Material Type (Tons)	1 Total Tons Generat ed	2 Salvag e or Reuse	3 Recyclin g (source- separat ed)	4 Mixed Processi ng Facility	5 Dispos al (Trash)	6 Facility or Destination
Example : Wood	50	5		45		Building Resources /SFR&D
Wood, Pallets & Lumber (clean & unpainted, no pressure treated wood)						
Cabinets, Fixtures, Doors, Windows, Equipment						
Metal						
Carpet						
Carpet Padding						
Cardboard						
Ceiling Tile						
Drywall						
Green Waste						
Concrete						
Asphalt						
Brick, Masonry, Tile						
Rock/Dirt/Soil						
MIXED DEBRIS						
Other (please specify)						
Sorted, Non-Recyclable, Non-Compostable Debris (please describe)						
TOTALS	A	B	C	D		

Use this formula to calculate YOUR DIVERSION RATE:

- (1) FIGURE TOTAL TONS DIVERTED: $B + C + D \times \text{(DR)}^* =$ _____
- (2) DIVIDE TOTAL TONS DIVERTED BY TOTAL TONS GENERATED TO FIGURE PERCENTAGE OF TONS DIVERTED: $=$ _____
- (3) MULTIPLY PERCENTAGE OF TONS DIVERTED BY 100 TO FIGURE DIVERSION RATE: $=$ _____% **YOUR DIVERSION RATE**

* If you are taking materials to a Mixed Debris Facility, please check with the facility for their diversion rate (DR)

If **YOUR DIVERSION RATE** is less than 75%, provide justification why the project cannot meet the 75% diversion requirement.

I declare that the foregoing is true and correct.

Signature: _____

Date: _____

Print Name: _____

Title: _____

DEMOLITION AND NEW CONSTRUCTION WASTE DIVERSION RATE TABLE (Cont.)

Instructions for completing the Waste Diversion Rate Table:

- Column 1 - This is the total ton of materials generated from this project listed by materials type
- Column 2 - Materials that will be separated on site in useable condition taken to salvage facility for reuse. Also includes materials reused on site such as wood forms, and inerts used as backfill, etc.
- Column 3 - Materials separated on site that will be taken to a facility to be reprocessed into new product. This included source separated materials such as wood, metal, cardboard, drywall, landscape debris, etc.
- Column 4 - Materials that are not source separated on site and are taken to a facility that will process mixed construction and demolition debris for recovery.
- Column 5 - Sorted, Non-Recyclable, Non-Compostable Debris hauled to a disposal facility;
MUST DESCRIBE
- Column 6 - Name of facility(s) used for recycling or disposal of each material generated from the project.

Submittal instructions:

Contractor to submit this completed and signed form to the University's Representative at Final Completion.

Final completion and payment will not be authorized without these submittals

SECTION 01 54 23 00 - TEMPORARY SCAFFOLDING AND PLATFORMS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of scaffolding-tubular steel. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.

1.2 PRODUCTS

- A. Tubular steel or aluminum scaffolding system shall comply with OSHA Safety and Health Standards, Section 29 CFR, 1926/1910.

1.3 EXECUTION - (Section not used.)

SECTION 01 56 00 00 - TEMPORARY BARRIERS, ENCLOSURES AND CONTROLS

PART I - GENERAL

1.01 SECTION INCLUDES

- A. Barriers and Enclosures
- B. Protected Walkways and Weather Closures
- C. Tree and Plant Protection
- D. Temporary Controls

1.02 RELATED SECTIONS

- A. Section 011100 – SUMMARY OF THE WORK
- B. Section 013500 – SPECIAL PROCEDURES
- C. Section 013900 - GREEN BUILDING POLICY IMPLEMENTATION
- D. Section 015610 – AIRBORNE CONTAMINANTS CONTROL
- E. Section 017400 – CLEANING

1.03 BARRIERS AND ENCLOSURES

- A. Barricades: Provide to prevent public entry, to protect existing trees and plants, and to protect existing facilities and adjacent properties from damage during construction period. Relocate and extend as construction progress requires per California MUTCD requirements.
- B. Partitions and Ceiling Enclosures:
 - 1. Fire Enclosures-Rated-Corridors and Rated Assemblies: Provide non-combustible dust-proof barrier framed with 20-gauge metal studs spaced 24" o/c maximum and covered on both sides with 5/8" thick Type-X rated gypsum wallboard fire taped, braced so to be self-supporting without fastening to existing finishes.
 - a. Provide gaskets of closed cell neoprene, or strips of fiberglass insulation between barriers and existing finish.

Finish exposed surfaces with two (2) coats of paint (color as selected by University), maintain in neat, orderly appearance and paint barrier on public side. Temporary emergency exit and or directional signage indicating Emergency Exits will be furnished and installed by **[Contractor][CM/Contractor][Design-Builder]**. Provide temporary doors in corridors with twenty (20) minute fire-rated assemblies and locksets to limit use.

- b. Use of access doors and routes by workmen to be approved by University's Representative.
 - 2. Fire Retardant Enclosures - Non-Rated Assemblies: Provide non-combustible dust-proof barriers framed with metal studs and covered on public side with Fire Retardant plastic laminate sheathing material. Flame spread 10 - smoke development 45 - fuel contribution

01 - General Requirements

undeterminable, as manufactured by Reef Industries, Inc., P.O. Box 33248, Houston, TX77033 or equal.

- a. Joints shall be taped and sealed over framing studs.
- b. Bracing shall be self-supporting without fastening to existing finishes.
- c. Provide gaskets of closed cell neoprene, or strips of fiberglass insulation between barriers and existing finishes.
- d. Provide non-staining taped seal to surrounding materials to insure seal.
- e. Non-Rated Assemblies for Dust Control: Use ½" Type-X or equal gypsum wallboard applied on occupancy side on framing member. Joints over studs shall be taped and sealed. Other detail similar to 1.03-B.2 above.

- C. Removal: Remove temporary materials, equipment and construction at completion; repair damage caused by installation or use of barricades and enclosures. Restore existing facilities used during construction to specified or to original condition.

1.04 DIESEL VEHICLE/EQUIPMENT IDLING PROCEDURES

- A. When drivers of diesel powered on-road vehicles arrive at loading or unloading areas to drop-off or pick-up passengers, supplies, equipment, materials, etc., they shall turn off their vehicle's engine as soon as possible but no later than five minutes after arrival.
- B. Operators of off-road diesel-powered equipment shall turn off their engines when the equipment is not performing its primary function, but no later than five minutes after the equipment has come to a stop.
- C. Idling for "warm-up" prior to diesel vehicle or equipment operations on University property shall be limited to a maximum of five minutes.
- D. At end of work shift, or for the purpose of servicing, all diesel equipment shall be parked on site at furthest location away from Hospital air intake systems.
- E. All diesel-powered equipment shall be maintained in good operating condition. University representative will direct **[Contractor][CM/Contractor][Design-Builder]** to remove any equipment producing high amount of diesel fumes resulting from diesel equipment being old or in poor operating condition.

PROTECTED WALKWAYS AND WEATHER CLOSURES

- F. Cover walkways to provide access to existing facilities for use by public and University personnel.
- G. Provide temporary roofing and weather-tight insulated closures of openings in exterior wall surfaces, to maintain specified working conditions, to protect products and finished work from inclement weather.
- H. Critical access and protected walkways shall comply with the CBC and CFC.

1.05 TREE AND PLANT PROTECTION

- A. Tree Protection: All trees not marked for removal shall be protected against damage from construction operations. Where necessary, in the opinion of University's Representative, trees surrounding building footprint or in close proximity to construction operation shall be protected with barricades. No trees shall be cut or felled without approval of University's Representative. Trees cut and/or removed without explicit instruction shall be replaced by **[Contractor][CM/Contractor][Design-Builder]** at no cost to the University.
- B. Cutting and Pruning: Cutting and pruning of trees to accommodate construction shall be done only with approval and direction by University's Representative. Soil within the spread of tree branches (within drip line) shall not be disturbed except as directed by excavation or trenching drawings. Advance notice shall be given University if tree roots of 3" diameter or greater must be cut.
- C. Drip line Protection: Cars, trucks, or equipment shall NOT be parked or set within the drip line of any tree; nor shall there be any stockpiling or temporary building erected within the drip line.

1.06 TEMPORARY CONTROLS

- A. Dust Control: **[Contractor][CM/Contractor][Design-Builder]** shall take appropriate steps throughout project to prohibit airborne dust due to work under this contract. Execute work by methods to minimize raising dust from construction operations. Water shall be applied wherever practical to settle and hold dust to minimum, particularly during demolition and moving of materials. No chemical dust prohibitor shall be used without written approval by University's Representative.
- B. Noise Control: Control noise as directed by University's Representative.
- C. Pollution Control: Use of noxious or toxic materials for all applications in alterations or work in buildings occupied by University personnel shall be done after proper notification and approval by University, this includes work performed on weekends or other unoccupied times.
 - 1. Provide methods, means and facilities to prevent contamination of soil, water and atmosphere from discharge of noxious, toxic substances and pollutants produced by construction operations.
- D. Waste Control: All waste materials resulting from process of clearing and construction shall be disposed of as follows:
 - 1. General Refuse: All refuse and debris, combustible and incombustible, resulting from construction process, shall be removed from University property as described in the General Conditions of the Contract. **[Contractor][CM/Contractor][Design-Builder]** shall not use any refuse container belonging to University.

01 - General Requirements

2. Hazardous Refuse: Solvents, oils and any other hazardous material shall be disposed of in containers and removed from site. At completion of work, any contaminated soil shall be removed and replaced with good soil by **[Contractor][CM/Contractor][Design-Builder]** at no expense to University. Coordinate disposal with UC Davis Health EH&S department.
 3. Building materials containing asbestos that are part of the project shall not be disturbed or removed by the contractor during the construction of temporary barriers, enclosures and controls. The contractor shall request from the University's Representative materials that have been identified on the project to contain asbestos so that these materials are not disturbed. The contractor shall refer to Section 013500 Special Procedures, 1.05 Hazardous Materials Procedures regarding materials impacted by construction of temporary barriers, enclosures and controls.
 4. All material and equipment removed as part of the Project is property of University, unless specifically designated otherwise; such material and equipment shall be delivered to a location at the campus, as directed by University, to be selectively sorted by the University; remaining debris shall be disposed of by **[Contractor][CM/Contractor][Design-Builder]** at no expense to University.
- E. Drainage Control: All portions of Work shall be kept free of standing water at all times during construction. Where required, temporary drainage ditches, berms, or pumping systems shall be constructed to divert drainage water from construction site, and resultant water shall be carried to nearest natural water course and disposed of without erosion to surrounding area. Care shall be taken to prevent silting of existing sinkholes and watercourses. Silt deposited as a result of the Work shall be removed and disposed of by **[Contractor][CM/Contractor][Design-Builder]** at no cost to the University.
1. Rough grade site to prevent standing water and to direct surface drainage away from excavations, trenches, adjoining properties and public rights-of-way/s.
 2. Maintain excavations and trenches free of water. Provide and operate pumping equipment of a capacity to control water flow.
 3. Provide de-watering system and pumping to maintain excavations dry and free of water inflow on a twenty-four (24) hour basis.
 4. Provide piping to handle pumping outflow to discharge in manner to avoid erosion or deposit of silt. Provide settling basins to avoid silting; install erosion control at out-falls of system.
 5. Winterize and stabilize site with Geotextile Fabric and gravel so that the site drains and avoids it becoming a quagmire. Maintain access roads on the site with Geotextile Fabric and gravel and make repairs to avoid furrow, ruts, or potholes.
 6. Remove equipment and installation when no longer needed.

- F. Sediment and Erosion Control: **[Contractor][CM/Contractor][Design-Builder]** shall furnish, install and maintain means and methods to reduce excessive erosion, minimize sedimentation discharge, and prevent construction materials discharge from causing off-site and on-site contamination. **[Contractor][CM/Contractor][Design-Builder]** shall coordinate with University.
1. **[Contractor][CM/Contractor][Design-Builder]** shall pay for and maintain required permits.
 2. **[Contractor][CM/Contractor][Design-Builder]** shall furnish:
 - a. National Pollutant Discharge Elimination (NPDE) permit.
 - b. **[Contractor][CM/Contractor][Design-Builder]** shall file Notice of Intent to California State Water Resources Control Board (SWRCB) stating date construction will begin. Provide copy to University.
 - c. **[Contractor][CM/Contractor][Design-Builder]** shall prepare, maintain and follow Storm Water prevention Plan. The Plan shall include **[Contractor][CM/Contractor][Design-Builder]**'s Best Management Practices (BMP) describing means and methods to control sediment, erosion and other pollutants.
 - d. **[Contractor][CM/Contractor][Design-Builder]** shall keep BMP Program at jobsite.

PART II - PRODUCTS

- 2.01 Polyethylene: Polyethylene used for critical barriers and for sealing walls, floors or ceiling systems shall be a minimum of 6 mil thickness and fire-retardant type listed by Fire Underwriters Laboratories, Griffolyn #T55R with Griffolyn fire retardant tape, or equal.

PART III - EXECUTION

- 3.01 Infection Control Risk Assessment ICRA Requirements:

- A. ****DELETE SECTION IF NON-PATIENT CARE SPACE*** NON-CLINICAL DUST CONTROL COVERED BY 1.03***
1. Refer to attached Infection Control Risk Assessment (ICRA) and UC Davis Health Construction Dust & Hazardous Materials Inspection Worksheet.
 - a. These documents dictate minimum requirements for Class I and II containments and minimum requirements that must be completed to control dust during construction.
 - 1) Mini containments (pop-up cubes) which are designed to have at most 1-2 people may be used in lieu of custom-built Class II Containments.
 2. The outside of the work containment shall have present: ICRA Permit, Interim Life Safety Measure (ILSM) Permit, Daily ICRA Inspection Forms, entry warning sign, Containment Entry Log (provided by the contractor) that lists all persons who enter the containment regardless of affiliation, including all University employees, and an emergency telephone number of persons to call 24 hours.
 3. Before any demolition or construction begins, all Protection Areas (infection control areas), control measures put in place and work plan by the

01 - General Requirements

[Contractor][CM/Contractor][Design-Builder] will be inspected by a designated University representative. Work cannot begin until the work containment has been inspected and approved.

3.02 Refer to the following Attachments:

- A. Appendix A - Construction Dust & Hazardous Materials Inspection Worksheet
- B. Appendix B - Initial Information and Benchmark Containment Inspections
- C. Appendix C - Entry Warning Sign with Project Manager Contact Information

UC DAVIS HEALTH CONSTRUCTION DUST & HAZARDOUS MATERIALS INSPECTION WORKSHEET – APPENDIX A

ICRA Permit Number	ICRA Class
Job # and Name	Project Manager
Estimated Start	Estimated Completion

ACKNOWLEDGEMENT OF HAZARDOUS MATERIALS

Does the project contact hazardous materials (e.g., asbestos, lead, mold, PCBs, mercury)?	Yes / No
Verified How: (e.g., hazmat survey, personal knowledge)	
By Whom: (name & department)	

CONTAINMENT STRATEGIES

Enclosure Types [check all that apply]	
Full Containment (poly over all surfaces not in SOW) Required	<input type="checkbox"/> Hard Barriers
Isolated Room – Critical Openings Only (seal doors, supply and return registers, etc)	
Mini Containment Cube (only large enough for 1-2 people; aka pop up cube)	
Shrouded Tool with HEPA filtered exhaust	
Glove Box Containment with HEPA filtered exhaust	
Other:	
Negative Pressure Requirements [check all that apply]	
-0.020" wc at all times (24/7) as displayed on mounted manometer	
-0.020" wc at setup with some negative pressure throughout project as displayed on manometer	
Visual Verification of some negative room pressure throughout project	
No negative room pressure required	
Negative pressure in localized HEPA exhausted work area (e.g. shrouded tool, glove box)	
Other:	
Negative Pressure Equipment [check all that apply]	
Onsite Challenge Testing (DOP or particle counting) prior to setup	
Challenge Tested within last 6 months; Equipment has remained onsite at University	
Single HEPA Unit; exhausted to: <input type="checkbox"/> Outdoors <input type="checkbox"/> Diffusion Box/Chamber	
Two HEPA Units in Parallel; exhausted to: <input type="checkbox"/> Outdoors <input type="checkbox"/> Diffusion Box/Chamber	
Other:	
Additional Containment Requirements [check all that apply]	

Ante Room	Masonite Floor Protection	Protective Clothing
Walk off mats	Shoe Covers	Air Scrubber
Other:		

VERIFICATION OF WORK

Type(s) of Inspection Required	Responsible Party
HEPA Equipment Verification	<input type="checkbox"/> EH&S <input type="checkbox"/> Consultant <input type="checkbox"/> Other:
Pre-Work Approval Inspection	<input type="checkbox"/> EH&S <input type="checkbox"/> Consultant <input type="checkbox"/> Other:

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 56 10 00 - AIRBORNE CONTAMINANTS CONTROL

PART I - GENERAL

1.01 SUMMARY

- A. Section Includes: University airborne contaminants control policy procedures and an Infection Control Risk Assessment (ICRA) and plan.

1.02 POLICY

- A. Airborne contaminants control is critical in all hospital areas, as well as non-hospital areas. **[Contractor][CM/Contractor]** shall limit dissemination of airborne contaminants produced by construction-related activities, including dust, chalk, powders, aerosols, fumes, fibers and other similar materials, in order to provide protection of immuno-compromised and other patients, staff, diagnostic operations, or sensitive procedures or equipment, from possible undesirable effects of exposure to such contaminants.
 - 1. Construction activities causing disturbance of existing dust, or creating new dust, or other airborne contaminants, must be conducted in tight enclosures cutting off any flow of particles into patient areas.
 - 2. Ceilings, walls in Protection Areas and other areas in patient care areas as indicated on drawings must be secure at all times.
- B. An Infection Control Risk Assessment (ICRA) and plan to mitigate dust is required for each project. The risk assessment identifies patient groups at risk for infection due to construction dust. The dust mitigation plan is designed to contain dust within the construction zone.
- C. If visible mold is found during construction, renovation, or repairs, any ICRA in-hand is invalid and risk assessment shall be performed to reevaluate ICRA levels and the work plan prior to restart of the work. Upon discovering, seal any openings, stop work and notify the University's Representative immediately. This includes projects that are already considered and operating under a Class IV.
- D. Related Sections:
 - 1. Section 017300 – CUTTING AND PATCHING: Removal of debris may be outside of normal work hours and shall be in tightly covered containers.
 - 2. Section 013500 – SPECIAL PROCEDURES: Perform work in accordance with requirements of this section.
 - 3. Section 013900 - GREEN BUILDING POLICY IMPLEMENTATION
 - 4. Section 015100 – TEMPORARY UTILITIES: Provide high efficiency particulate air (HEPA) filters as specified in Section 015610, negative pressure ventilation, or special control of existing system as determined by University's Representative.
 - 5. Section 015600 – TEMPORARY BARRIERS, ENCLOSURES AND CONTROLS: Extend barriers above ceilings as required to seal off and contain airborne contaminants.
 - 6. Section 015600 – TEMPORARY CONTROLS: Contain waste materials during removal; bagging, wrapping, and transporting.

7. Section 017400 – CLEANING: Use wet cleaning methods and HEPA filtered vacuum cleaners as required to minimize release of airborne contaminants. Contain waste materials, debris and rubbish as noted above. Disinfect Containment and Protection Areas as directed by University's Representative

E. Dust Mitigation Requirements

1. An ICRA Daily Inspection Log ~~Compliance Survey~~ is attached at the end of this section under UC Davis Health Construction Dust Infection Prevention Best Practice Standard. The **[Contractor][CM/Contractor]** must complete this daily checklist and leave posted for the duration of the project at the outside of the containment. Any areas of non-compliance must be specifically listed and addressed for corrective measures when identified. A copy of the daily ICRA inspections shall be submitted to the University's Representative at an agreed upon time between the **[Contractor][CM/Contractor]** and the Project Manager.

F. UC Davis Health Construction Dust Infection Prevention Best Practice Standard

- a. The UC Davis Health Construction Dust Infection Prevention Best Practice Standard is attached at the end of this Section and augments information & requirements of Section 015610.
- b. Refer to the UC Davis Health Construction Dust Infection Prevention Best Practice Standard per requirements for.
 - 1) Responsibilities
 - 2) Procedures
 - 3) Training And Certifications
 - 4) Containment Design & Construction
 - 5) Materials And Equipment
 - 6) Cleaning Procedures
 - 7) Documentation
 - 8) Containment Verification
 - 9) Inspection Criteria
 - 10) And other Dust Infection Prevention Measures

1.03 SUBMITTALS

- A. Submit to Project Inspector or Post at Anteroom Daily ICRA Inspection Log.
- B. Schedules: Submit work areas and procedure schedules for containment of airborne contaminants. Include this work in the Project Schedule per 013200.
- C. Detailed Work Plan: Drawings including but not limited to Work Area/ Floor Plan, Path of Travel, Egress and Exiting, Rated Construction and details of construction of necessary temporary

barriers, and description of procedures to be used to achieve and maintain control of construction-related airborne contaminants.

1. As applicable, the drawing should include the following: location of ante room(s), location of manometer, location of negative air units exhausting outside the building including number of negative air units and sizes (cfm), and location of sealed blocked off areas of corridors. Any impacts to corridors will need to be approved via ILSM (see specification section 013500 for details).
 2. Identify the areas surrounding the project area, assessing potential impact of construction on the patient care area. Identify the specific uses (e.g., patient rooms, medication room, operating room, etc.)
 3. Identify the potential impacts including but not limited to.
 - a. HVAC, Ventilation (outages, air flow directions, clean to dirty, air intakes/exhausts, air balance, disruptions, etc.).
 - b. Plumbing (outages, hand-washing access, work area, flushing/draining systems, charging systems, disinfecting systems, etc.).
 - c. Electricity (outages for critical equipment, special ventilation areas, monitoring).
 - d. Identify Airborne infection isolation rooms and patient rooms with immunocompromised conditions that will require High-efficiency Particulate Air (HEPA) filters.
 4. Identify containment measures including but not limited to types of barriers to be used. HEPA filtration to be used. Renovation/construction areas should be isolated from occupied areas during construction and provide clean-to-dirty airflow with respect to surrounding areas.
 5. Assess preventive maintenance requirements. Will the service/maintenance frequency and level of service of systems need to be modified during construction (e.g., ventilation filters, air intake system, potable water, plumbing, doors). Work Hours: Can or will the work be done during non-patient care hours?
 6. Include provisions for but not limited to traffic flow, entrance, egress, control, debris removal and housekeeping.
 7. Work Hours: Identify areas of work that will be done during non-patient care hours. Refer to Sections 011100 Summary of Work and Section 011400 Work Restrictions
 8. The Detailed Work Plan shall be reviewed and approved by the University's Representative prior to the start of Construction.
- D. Project Experience and Training: In order to be considered qualified to work with negative pressure containments; **[Contractor][CM/Contractor]**'s must demonstrate experience by providing either of the following:
1. Previously completed, documented negative pressure containment work in a healthcare facility along with an owner reference. Minimum documentation shall include project descriptions and photographs or containment schematics.
 2. Documentation that the contactors' proposed foreman has successfully obtained one of the following from the American Society for Healthcare Engineering (ASHE):

- a. Certified Healthcare Constructor (CHC) Certification
- b. Health Care Construction (HCC) Certificate
- c. Managing Infection Prevention During the Construction & Operation of Health Care Facilities Course Completion

1.04 QUALITY CONTROL

- A. Pre-construction Meeting: Before any construction on site begins, **[Contractor][CM/Contractor]**'s Superintendent is required to attend a mandatory pre-construction orientation session held by University's Representative for a review on precautions to be taken.
- B. Review by PO&M HVAC staff for possibility to disconnect air supply and return into the project area. Negative air machines shall be connected to separate electrical circuits.
- C. Notification: A minimum of fourteen (14) calendar days written notification to University's Representative of possible construction activity causing airborne contaminants in Protection Areas.

1.05 DEFINITIONS

- A. Containment Areas: As determined by University's Representative and if shown. Includes all areas of construction activities, adjacent staging and storage areas, and passage areas for workers, supplies and waste. The containment area includes ceiling spaces above and adjacent to construction activities.
- B. Critical Openings – Include all potential paths for air and contaminants to move from the project area to outside of the project area and include: supply registers, return registers, exhaust registers, doors, windows, and other openings within the area where contaminants can escape. Sealing the critical openings can be accomplished with tape, plastic, hard barriers and a combination of these materials to seal airtight the critical opening.
- C. HEPA System DOP Testing – An ANSI / ASTM recognized method to test the integrity of a High Efficiency Particulate filter which filters out 99.97% of particles 0.3 micrometers or larger. DOP testing is performed by specialty **[Contractor][CM/Contractor]**'s. The Health System requires that HEPA systems be tested to the ANSI / ASTM standard as delivered prior to their use onsite as further described in this Standard.
- D. ICRA (ICRA) Infection Control Risk Assessment - An evaluation of patient risk based on a matrix of the patient population health in the work area and the invasiveness of the project. This assessment ultimately generates a permit (ICRA permit) issued by Infection Prevention requiring compliance with one of four precaution levels. The ICRA program is documented in Hospital P&P 2120. ICRA's apply to patient care areas and their adjoining contiguous areas. All ICRA evaluations are the sole responsibility of the Health System Infection Prevention Department based on an application by the Project Manager. ICRA Permits expire and can be extended subject to approval by the Infection Prevention Department.

1.06 PERFORMANCE REQUIREMENTS

- A. University's Representative's Responsibilities:
 - 1. Determination of the Containment and Protection Areas, as well as, the standard of limitations of the **[Contractor][CM/Contractor]**'s responsibilities, required for the project.

2. Statement of Requirements: Description in graphic and written form as required to communicate the above based on evaluation of the construction area and the impact of the project on patient care.
 3. Coordinate any testing and monitoring as necessary with EH&S or a third party.
- B. **[Contractor][CM/Contractor]** Responsibilities:
1. Provide specific means and methods of achieving and maintaining control of airborne contaminants during construction.
 2. Implement all mitigation measures as listed in the UC Davis Health Construction Dust & Hazardous Materials Inspection Worksheet, which have been reviewed and approved by Infection Prevention and EH&S. The work shall be performed in accordance with the specific ICRA/Dust Mitigation Plan, Class (I, II, III or IV) and approved ICRA Permit. **[Contractor][CM/Contractor]** shall ensure that all workers are trained and adhere to the mitigation requirements including provisions indicated per UC Davis Health Construction Dust Infection Prevention Best Practice Standard attached at the end of this Section.
 3. **[Contractor][CM/Contractor]** shall notify University's Representative in writing, a minimum of fourteen (14) calendar days prior to starting construction activity, which might be expected to produce excess levels of airborne contaminants in containment area so that additional precautions may be taken.
 4. If project construction activities will occur beyond the expiration date identified in the ICRA Permit, **[Contractor][CM/Contractor]** shall coordinate with University's Representative to request extension of the ICRA Permit utilizing the ICRA Permit Extension Form attached ~~provided~~ at the end of in this section.

PART II - PRODUCTS

2.01 MATERIALS

- A. Polyethylene: Polyethylene used for critical barriers and for sealing walls, floors or ceiling systems shall be a minimum of 6 mil thickness and fire retardant type listed by Fire Underwriters Laboratories, Griffolyn #T55R with Griffolyn fire retardant tape, or equal.

PART III - EXECUTION

- 3.01 PROJECT SPECIFIC REQUIREMENTS: The below criteria shall be applied on a case by case basis as outlined in the project specific requirements, ICRA Permit(s), and EH&S Worksheet(s)

- A. ~~PM TO MODIFY THIS SECTION. ATTACH ICRA PERMITS, EH&S WORKSHEETS, OR ANY OTHER APPLICABLE DOCUMENTATION~~
- B. ~~THE BELOW LISTED CRITERIA ARE POSSIBLE STRATEGIES FOR CLASS 3 AND 4 CONTAINMENTS. NOT ALL OF THE STRATEGIES WILL BE ALLOWED OR REQUIRED. THE ICRA PERMIT AND EH&S WORKSHEET DEFINE WHAT IS ALLOWABLE. THINK OF THE ICRA PERMIT AND EH&S WORKSHEET AS A MENU. THE BELOW IS A DETAILED DESCRIPTION OF EACH ITEM ON THAT MENU.~~

3.02 CONTAINMENT CRITERIA

- A. The outside of the work containment shall have present: ICRA Permit, Interim Life Safety Measure (ILSM) Permit, Daily ICRA Inspection Forms, manometer, entry warning sign,

Containment Entry Log (provided by the **[Contractor][CM/Contractor]**) that lists all persons who enter the containment regardless of affiliation, including all University employees, an emergency telephone number of person to call 24 hours a day in the event of a negative pressure alarm or other issue, and that an Environment of Care Incident Report under the category of “Construction Dust” must be filed by area nursing management in case of constant or annoying alarms.

- B. The interior of the containment area shall be cleaned on a continual basis daily. Hard surface floors in work area, adjacent hallways and passage areas require vacuuming with HEPA-filtered vacuum cleaners and frequent wet-mopping during demolition and construction; protect adjacent carpeted areas with plastic and plywood and vacuum with HEPA-filtered vacuum cleaners. Only an EPA Listed Germicide approved by the UC Davis Health Infection Prevention shall be used on the project site.
- C. Regardless of containment strategies, execute work by methods to minimize raising dust from construction operations. Water may be used to assist in controlling airborne dust.
- D. Full containment
 - 1. All surfaces in the containment area except surface where work is to occur must be covered in plastic unless they are non-porous, smooth, and accessible for cleaning.
 - 2. Sealing of Openings: Use tape or other impenetrable sealant to seal barrier wall seams, cracks around window and door frames, exhaust system ductwork, pipes, joints and ducts. Use of spray glue is not acceptable to be used inside of the building.
 - 3. **[Contractor][CM/Contractor]** must block off existing ventilation supply registers, return registers and exhaust registers in the construction area.
 - 4. All polyethylene and other materials used for temporary enclosures shall be at least 6 mil thickness and fire-retardant type. Zip poles or other easily removable supports shall be used for projects extending beyond one work shift. Temporary walls with metal stud framing may be required for long term projects and must be approved by the Project Manager. All doors leading into the containment area shall utilize zippered doors for control of the air flow and closing the plastic doors.
- E. Critical seal of areas
 - 1. Use tape or other impenetrable sealant to seal barrier wall seams, cracks around window and door frames, exhaust system ductwork, pipes, joints and ducts. Use of spray glue is not acceptable to be used inside of the building.
- F. Cubes
 - 1. Mini-containments (pop-up cubes) which are designed to have at most 1-2 people are means of control to access attic spaces, wall spaces and subfloor spaces usually at defined entry points such as access hatches or above a drop-in ceiling system. Cubes are reviewed and approved by the University’s Representative on a case by case basis.
- G. Glove Boxes
 - 1. A glove box can be used for some work where a HEPA filtered vacuum is attached to the glove box when a small area of work is to be performed. A glove bag is attached to the box enclosure to allow the worker to make small openings by drilling or cutting within the negative pressure glove box. Glove boxes are reviewed and approved by the University’s Representative on a case by case basis.

H. Shrouded tools

1. Shrouded tools can be used for some work. A HEPA (DOP Tested) filtered vacuum is attached to the shroud. Shrouded tools are reviewed and approved by the University's Representative on a case by case basis.

3.03 NEGATIVE AIR CRITERIA

- A. Under no circumstances shall the HEPA filtered air be discharged into existing HVAC returns, exhaust ducting or building plenum spaces.
- B. When the air from the HEPA filtered negative air unit exhaust cannot be directed outside of the building due to no windows in the vicinity of the work or if impractical, all HEPA filtered negative air units shall be exhausted to a location agreeable to the PM. Each HEPA unit shall be plugged into a separate electrical circuit to provide temporary redundancy should one unit fail or due loss of electrical power. The PO&M Electrical shop shall inspect and test each circuit connected to the HEPA negative air unit prior to use.
- C. When the air from the negative air units is exhausted inside of the building, the exhaust air from negative air unit shall be directed into a "diffusion cube" constructed of pleated filters to disperse the air in a manner that does not raise dust or blow air directly onto patients, staff or visitors. The **[Contractor][CM/Contractor]** shall consider and install charcoal filters in the negative air units to control smells/odors associated with the construction.
- D. Negative air units shall be positioned as far from the entry ante room containment as possible for distribution of air flow throughout the project area. The number of negative air units shall be to provide sufficient negative pressure and for a minimum of at least four (4) air changes per hour of the volume of the entire work containment.
- E. Dual HEPA Units operating in parallel may be required for redundancy in high-risk areas.

01 - General Requirements

F. DOP testing of HEPA equipment

1. Negative air units and HEPA filtered vacuums are to be challenge tested onsite by the DOP test method by a third party prior to being placed in service, after a HEPA filter change, when dropped or damaged or moved from the project site. Only HEPA systems that pass the challenge DOP testing can be used on the project. All HEPA equipment shall be tested per ANSI/ASME N510 Section 10 to ensure 99.97% efficiency at 0.3 micrometer mean aerodynamic diameter.
2. The entire piece of HEPA equipment shall be challenge tested, not just the filter media. The University's Consultant or EH&S shall witness the HEPA challenge testing procedure in entirety. Once the HEPA system passes the challenge testing and passes, the HEPA equipment may be used at the location tested for a period not to exceed one year. The testing label shall remain on the HEPA equipment and remain legible. Re-testing of the HEPA equipment is required annually, if the piece of equipment is transported out of the building to another building location on the campus, if dropped, or otherwise subjected to forces that might unseat the HEPA filter, damaged by water or laceration of the filter or if HEPA filter maintenance or adjustments are performed.
3. When utilizing HEPA Filtered Vacuums for glove boxes or shrouded tools these HEPA Vacuums must be DOP tested.

3.04 NEGATIVE AIR MONITORING CRITERIA

A. Fully Monitored Negative Air Maintaining -0.020" Water Column (in-WC)

1. Build containment with negative air machines capable of maintaining a pressure differential of -0.020 in-WC across all critical barriers
2. Demonstrate negative pressure is achieved continuously (24/7) by means of an electronic manometer sensitive to measure down to -0.020" wp. An Omniguard IV recording manometer is recommended as the standard instrument for containment pressure monitoring, but other electronic manufactured models with similar sensitivities at low pressures and recording capabilities are acceptable.

B. Hybrid Monitoring and Visual Verification

1. Build containment with negative air machines capable of maintaining a pressure differential of -0.020 in-WC across all critical barriers.
2. During the course of construction, the scope of work may dictate removal of work (e.g. Ceilings or drywall) that would make it difficult to maintain -0.02 in-WC of negative pressure. During working hours Visual Verification of negative pressure may be used in lieu of the -0.02 in-WC requirement with electronic monitoring.
3. At the end of shift all openings must be sealed to bring the containment back to the -0.020 in-WC requirement.

C. Visual Verification

1. The containment shall be visually inspected to verify the plastic is bowed inward to the project area. Tell tail ribbon may also be used to confirm negative pressurization. Visual Verification of negative pressure without the use of a manometer shall be performed upon first entry to the work area, during the course of the work, especially if there are any

changes to the work space that may change the negative pressure, prior to taking any breaks and at the end of the work period.

3.05 ADDITIONAL CONTAINMENT CRITERIA

A. Ante Room

1. An ante room is a separate chamber attached to the containment area with zippered doors to allow entry and exit into the containment area. Entry into the containment area shall be only via the ante room. The ante room is commonly constructed of zip poles or equivalent, plastic and tape. The ante room is sized for each project to allow workers and equipment to be moved into and out of the containment area. A sticky mat is required in the ante room for workers and carts on wheels to use when exiting the ante room from the containment area. The zippered doors are to remain closed or adjusted slightly open as necessary to allow negative pressure to be maintained at least -0.020 in-WC.
2. The ante room shall have a sticky mat present which is intended to remove any debris from the bottom of work shoes before leaving the ante room into the public area. The sticky mat is not intended to clean debris from the bottom of disposable coveralls or from booties. The sticky mat layers shall be replaced many times during a work shift when work involves movement of many workers and supplies out of the containment area. The **[Contractor][CM/Contractor]** is responsible for removing a dirty sticky mat and replacing it with a clean one when it is necessary.
3. Workers entering into the containment area will put on a full body disposable coverall with booties inside of the ante room before entering the containment area. Entry into the ante room requires one of the two zippered doors to be opened at one time to maintain the required negative pressure. After entering the ante room, the zipper shall be closed before leaving the ante room into the containment area.

B. Air Scrubbing

1. The **[Contractor][CM/Contractor]** shall place additional HEPA filtered fan units (negative air unit) inside of the project work area and operate them in recirculation mode or "scrub mode" near the final cleaning phase of the project to aide in additional particulate cleaning of the space. These units will circulate air internal to the containment area and scrub the air to reduce the total airborne particle concentrations inside of the containment area.

C. Disposable Coveralls and Booties

1. Disposable coveralls are required in all Class IV containment areas and selected to provide protection of street clothes from particulates generated inside of the containment area. Disposable coveralls shall be changed if they become ripped and are no longer serviceable.
2. Proper use of the disposable coveralls, booties and use of the sticky mat shall be followed at all times for all workers and UC Davis Health employees, when it is required by the ICRA Permit. At no time shall workers leave the containment area wearing disposable coveralls and booties. They are to be removed in the ante room or immediately in front of the ante room within the containment area if it is free and clean of debris. The workers shall remove all disposable coveralls and booties and place them in the plastic garbage bag and leave the ante room after walking on the sticky mat.

3.06 CONTAINMENT SET UP

01 - General Requirements

- A. Notify University's Representative forty-eight (48) hours prior to containment set up.
- B. Build containment in compliance with ICRA, drawings and plans.
- C. Notify University's Representative and EH&S for inspection prior to start of work. Before any demolition or construction begins, all Protection Areas (infection control areas), control measures put in place and work plan by the **[Contractor][CM/Contractor]** will be inspected by the University's Environmental Health & Safety Personnel, or by a designated representative of the University. Work cannot begin until the containment area has been inspected and approved, meeting all of the provisions of the ICRA Permit.

3.07 REMOVAL OF CONTAINMENT

- A. Provide thorough cleaning of existing surfaces, which become exposed to dust, before leaving the containment area and before allowing staff and the public access to the project area.
- B. Final cleaning of the containment area requires diligent HEPA vacuuming of all horizontal surfaces and wet wiping all surfaces. Clean towels, sponges, cloth rags or other means shall be used with clean water to effectively clean all surfaces within the containment area. Use of a measured solution of an EPA Listed Germicide is required as part of the final detail cleaning.
- C. Additional HEPA filtered negative air units may be installed for scrubbing of particles (see 3.05 B).
- D. Coordinate with the University's Representative to call for a final visual inspection of the containment area. The final visual inspection will be made after the **[Contractor][CM/Contractor]** has thoroughly cleaned the entire containment area. The **[Contractor][CM/Contractor]** will be allowed to remove the containment barriers after the interior has passed the visual inspection for cleanliness.
- E. Particle count assessment may be made inside of the containment area by the University's Representative as part of the final visual inspection process in addition to the final visual inspection. Particle testing will include testing the airborne concentration of various particle sizes compared to the concentration outside of the containment area. If particle counts inside of the containment area are significantly greater than outside of the containment area, the **[Contractor][CM/Contractor]** shall continue to scrub the air inside of the project area with HEPA filtered negative air units and conduct additional surface cleaning until subsequent particle testing has demonstrated particle concentrations inside of the containment area are not significantly greater than particle concentrations immediately outside of the containment area.

3.08 ENTRY/EGRESS

- A. Entry into the project containment area shall be through the ante room. Entry into the ante room requires one of the two zippered doors to be opened at one time to maintain the required negative pressure. After entering the ante room, the zipper shall be closed before leaving the ante room into the containment area. Equipment and supplies brought into the containment area shall be in sealed leak tight containers inside of rolling covered carts. Equipment, tools and supplies brought into the building shall be clean and free of dust, debris, mold and other contaminants. Cardboard products shall not be brought into the containment area if they are water damaged or have suspect mold growth.
- B. All HEPA equipment when transported into and out of the containment area shall be cleaned of all debris on the surfaces and shall have the intake openings sealed with plastic and duct tape.
- C. All workers leaving the containment area shall leave in clean clothes. At no time shall disposable coveralls or booties be worn when leaving the containment area through the anteroom into the

public area. The workers shall clean all gross particulate debris from the coveralls using a HEPA filtered vacuum. Disposable coveralls can be taken off after gross debris has been removed from the disposable coveralls. The worker shall remove the disposable coverall inside of the ante room by rolling the disposable coverall inside out and then place it into a garbage container (plastic bag) located inside of the ante room or just inside of the project work area.

- D. All equipment and supplies leaving the containment area shall be cleaned of all dust and debris before leaving the containment area. Removal of supplies, materials and waste debris from the containment area shall be using tightly covered containers/carts that contain the waste material. The wheels of carts shall be cleaned on a frequent schedule to minimize track-out of debris as they are removed from the containment area. All waste material shall be in sealed leak tight containers. If plastic bags are used, they shall be 6 mil thick at a minimum.

3.09 ENFORCEMENT

- A. Failure to maintain required containment will result in issuance of written warning; if situation is not corrected within eight (8) hours of receipt of warning, University will have cause to stop the work as provided in Article 2.1 (if Brief Form) or 2.3 (if Long Form) of the General Conditions. Any egregious violation of safety requirements shall be grounds for Immediate Work Stoppage.

Infection Control Risk Assessment

Matrix of Precautions for Construction & Renovation

STEP 1

Using the following table to *identify* the **Construction Type A, B, C or D**

TYPE A	<p>Inspection and Non-Invasive Activities. Includes, but is not limited to:</p> <ul style="list-style-type: none"> <i>f</i> removal of ceiling tiles for visual inspection only, e.g., limited to 1 tile per 50 square feet <i>f</i> painting (but not sanding) <i>f</i> wallcovering, electrical trim work, minor plumbing, and activities which do not generate dust or require cutting of walls or access to ceilings other than for visual inspection.
TYPE B	<p>Small scale, short duration activities which create minimal dust Includes, but is not limited to:</p> <ul style="list-style-type: none"> <i>f</i> installation of telephone and computer cabling <i>f</i> access to chase spaces <i>f</i> cutting of walls or ceiling where dust migration can be controlled.
TYPE C	<p>Work that generates a moderate to high level of dust or requires demolition or removal of any fixed building components or assemblies Includes, but is not limited to:</p> <ul style="list-style-type: none"> <i>f</i> sanding of walls for painting or wall covering <i>f</i> removal of floorcoverings, ceiling tiles and casework <i>f</i> new wall construction <i>f</i> minor duct work or electrical work above ceilings <i>f</i> major cabling activities <i>f</i> any activity which cannot be completed within a single work shift.
TYPE D	<p>Major demolition and construction projects Includes, but is not limited to:</p> <ul style="list-style-type: none"> <i>f</i> activities which require consecutive work shifts <i>f</i> requires heavy demolition or removal of a complete cabling system <i>f</i> new construction.

Step 1 - Construction Type:

UCDH Construction Dust & Hazardous Materials Inspection Worksheet

ICRA Permit Number	ICRA Class
Job # and Name	Project Manager
Estimated Start	Estimated Completion

ACKNOWLEDGEMENT OF HAZARDOUS MATERIALS

Does the project contact hazardous materials (e.g., asbestos, lead, mold, PCBs, mercury)?	Yes <input type="checkbox"/>	No <input type="checkbox"/>
Verified How: (e.g., hazmat survey, personal knowledge)		
By Whom: (name & department)		

CONTAINMENT STRATEGIES

Enclosure Types [check all that apply]			
<input type="checkbox"/>	Full Containment (poly over all surfaces not in SOW)	<input type="checkbox"/>	Hard Barriers Required
<input type="checkbox"/>	Isolated Room – Critical Openings Only (seal doors, supply and return registers, etc)		
<input type="checkbox"/>	Mini Containment Cube (only large enough for 1-2 people; aka pop up cube)		
<input type="checkbox"/>	Shrouded Tool with HEPA filtered exhaust		
<input type="checkbox"/>	Glove Box Containment with HEPA filtered exhaust		
<input type="checkbox"/>	Other:		
Negative Pressure Requirements [check all that apply]			
<input type="checkbox"/>	-0.020" wc at all times (24/7) as displayed on mounted manometer		
<input type="checkbox"/>	-0.020" wc at setup with some negative pressure throughout project as displayed on manometer

Infection Control Construction Permit (Post At Job Site)

ICRA Permit No:		ICRA Class:			
Location of Construction:			Project Start Date:		
Project Coordinator:			Estimated Duration:		
Contractor Performing Work:			Permit Expiration Date:		
Supervisor:			Telephone:		
YES	NO	CONSTRUCTION ACTIVITY	YES	NO	INFECTION CONTROL RISK GROUP
		TYPE A: Inspection, non-invasive activity			GROUP 1: Low Risk
		TYPE B: Small scale, short duration, moderate to high			GROUP 2: Medium Risk
		TYPE C: Activity generates moderate to high levels of dust, requires greater 1 work shift for completion			GROUP 3: Medium/High Risk
		TYPE D: Major duration and construction activities requiring consecutive work shifts			GROUP 4: Highest Risk
CLASS I		<ol style="list-style-type: none"> 1. Execute work by methods to minimize raising dust from construction operations. 2. Immediately replace any ceiling tile displaced for visual inspection. 3. Clean work area upon completion of task. 			
CLASS II		<ol style="list-style-type: none"> 1. Isolate HVAC system in area where work is being done to prevent contamination of the duct system. 2. Complete all critical barriers or implement control cube method before construction begins. 3. Place dust mat at entrance and exit of work area. 4. Water mist work surfaces to control dust while cutting. 5. Contain construction waste before transport in tightly covered containers 6. Wipe surfaces with cleaner/disinfectant. 7. Remove barrier materials carefully to minimize spreading of dirt and debris. 			
CLASS III		<ol style="list-style-type: none"> 1. Isolate HVAC system in area where work is being done to prevent contamination of the duct system. 2. Complete all critical barriers or implement control cube method before construction begins. Seal holes, pipes, conduits, and punctures appropriately. 3. Place dust mat at entrance and exit of work area. 4. Maintain negative air pressure utilizing HEPA equipped air filtration units to control dust. 5. Vacuum work with HEPA filtered vacuums. 6. Wipe surfaces with cleaner/disinfectant. 7. Contain construction waste before transport in tightly covered containers. 8. Do not remove barriers from work area until complete project is clean and checked by Environmental Health and Safety or its representative. 9. Remove barrier materials carefully to minimize spreading of dirt and debris. 			
Date					
Initial					
CLASS IV		<ol style="list-style-type: none"> 1. Isolate HVAC system in area where work is being done to prevent contamination of the duct system. 2. Complete all critical barriers or implement control cube method before construction begins. Seal holes, pipes, conduits, and punctures appropriately. 3. Place dust mat at entrance and exit of work area. 4. Maintain negative air pressure within work site utilizing HEPA equipped air filtration units. 5. Construct anteroom and require all personnel to pass through room so they can be vacuumed using a HEPA vacuum cleaner before leaving work site, or personnel can wear cloth or paper coveralls that are removed each time they leave the work site. 6. All personnel entering work site are required to wear shoe covers. 7. Contain construction waste before transport in tightly covered containers. Utilize tape coverings. 8. Vacuum work area with HEPA filtered vacuums. 9. Wipe surfaces with cleaner/disinfectant. 10. Do not remove barriers from work area until complete project is clean and checked by Environmental Health and Safety or their representative. 11. Remove barrier materials carefully to minimize spreading of dirt and debris. 			
Date

Additional Requirements:					
Permit Requested By:			Permit Authorized By:		
Date:			Date:		

STEP 2

Using the following table of **Patient Risk Groups**, identify the **Risk Level (Low, Medium, High, Highest)** posed by the project. Also provide further description of uses / risk groups as necessary that are not otherwise listed in the table. If more than one risk group will be affected, select the higher risk group:

Low Risk	Medium Risk	High Risk	Highest Risk
f Office areas OTHER: <div style="border: 1px solid black; height: 150px; width: 100%;"></div>	f Cardiology f Echocardiography f Endoscopy f Nuclear Medicine f Physical Therapy f Radiology/MRI f Respiratory Therapy OTHER: <div style="border: 1px solid black; height: 100px; width: 100%;"></div>	f CCU f Emergency Room f Labor & Delivery f Laboratories (specimen) f Medical Units f Newborn Nursery f Outpatient Surgery f Pediatrics f Pharmacy f Post Anesthesia Care Unit f Surgical Units OTHER: <div style="border: 1px solid black; height: 50px; width: 100%;"></div>	f Any area caring for immunocompromised patients f Burn Unit f Cardiac Cath Lab f Central Sterile Supply f Intensive Care Units f Negative pressure isolation rooms f Oncology f Operating rooms including C-section rooms OTHER: <div style="border: 1px solid black; height: 100px; width: 100%;"></div>

Step 2 - Risk Level:

STEP 3

Use the table below to determine the ICRA Classification.

Patient Risk Group (*Low, Medium, High, Highest*) with the planned ...
Construction Project Type (*A, B, C, D*) on the following matrix, to find the
Class of Precautions (*I, II, III or IV*) or level of infection control activities required.
Class I-IV or Color-Coded Precautions are delineated on the following page.

PATIENT RISK GROUP	CONSTRUCTION PROJECT TYPE			
	TYPE A	TYPE B	TYPE C	TYPE D
LOW Risk Group	I	II	II	III/IV
MEDIUM Risk Group	I	II	III	IV
HIGH Risk Group	I	II	III/IV	IV
HIGHEST Risk Group	II	III/IV	III/IV	IV

Step 3 – Classification Determination:

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 56 20 00 - REQUIREMENTS FOR CEILING ACCESS TO SPACES CONTAINING ASBESTOS

PART I - GENERAL

1.01 SECTION INCLUDES

- A. This section outlines policy and procedures for access to ceiling spaces containing or suspected of containing asbestos fireproofing, thermal insulation, or other asbestos containing material.
- B. Work that may disturb asbestos but is not intended to result in intentional asbestos removal shall be controlled in accordance with this section, as well as Cal/OSHA requirements for Class III asbestos work contained in California Code of Regulations, Title 8, Section 1529. Moving ceiling tiles or horizontal hatches to access ceiling spaces with asbestos fire proofing or containing debris from asbestos thermal insulation is Class III asbestos work. The University Representative may approve modifications to these procedures. This section outlines minimum requirements. Controls that exceed these requirements may be used.

PART II - Not applicable to this section

PART III - EXECUTION

3.01 Training

- A. Personnel performing work in spaces containing or suspected of containing asbestos material shall have training which meets the requirements of Cal/OSHA Class III asbestos work that is specific to the work task to be completed. This training shall adhere to requirements as set forth in 40 CFR 763.92(a)(2).

3.02 Competent Person

- A. During work in asbestos contaminated attic spaces, an asbestos Competent Person, as defined by 8 CCR 1529, shall be present at all times to oversee safe access and control measures. A Competent Person shall inspect the area to assure the controlled work area is properly established, and to determine that appropriate cleanup has occurred at the end of the work task. The Competent Person shall adhere to all requirements within their area of responsibility outlined in 8 CCR 1529.

3.03 Standard Access/Egress Procedures from Mini-Enclosure

- A. Access into an attic space with asbestos shall be completed using a manufactured mini-enclosure, or an equivalent enclosure constructed on site. Use of a small HEPA filtered negative air unit attached or integrated with the mini-enclosure to create negative pressure in the enclosure is required. A HEPA filtered vacuum shall be present and available for use in the mini-enclosure. The mini-enclosure must be posted with the asbestos warning sign in accordance with Cal/OSHA Title 8 CCR 8 1529. Access into the enclosure must be restricted to trained personnel, who are required to wear full body coveralls and a respirator approved for asbestos. A sticky mat shall be present immediately outside of the mini-enclosure. Any debris generated by work activity must be cleaned up using a HEPA vacuum and wet wiping techniques. All mini-enclosures and HEPA vacuums must be re-certified by a third-party using DOP testing every 6 months.

- B. Disposable full body coveralls are required in all ICRA Class III and IV containment areas dealing with asbestos or presumed asbestos and shall be selected to provide protection of street clothes from particulates generated inside of the containment area. All work inside a mini enclosure for asbestos related work is considered ICRA Class III or IV. Disposable coveralls shall be changed if they become ripped and are no longer serviceable.
- C. Proper use of the disposable coveralls and use of the sticky mat shall be followed at all times for all workers and University employees, when it is required by the ICRA Permit. At no time shall workers leave the mini enclosure wearing soiled disposable coveralls and booties. At times, in select areas requiring sterile environments, it may be necessary to change from soiled disposable clothing into clean disposable clothing before exiting containment. Coveralls and booties are to be removed inside the mini-enclosure and placed into a labeled, secured, plastic asbestos waste bag before leaving the mini-enclosure.

3.04 Air Sampling

- A. Air sampling is required per 8 CCR 1529 to assess asbestos exposures when the project requires workers to enter the attic space if there is a reasonable possibility that the permissible exposure limit (PEL) may be exceeded. The air sampling frequency shall be sufficient to assess all work activities in the mini-enclosure and in the attic space and may include both 30-minute Excursion sample periods and longer sampling periods.

3.05 Debris Clean-up

- A. All debris inside of the mini-enclosure shall be cleaned up promptly by HEPA vacuuming and wet wiping techniques and before each time the mini-enclosure is moved. These techniques of minimizing asbestos fiber migration are outlined in 8 CCR 1529 and are to be strictly adhered to.

3.06 Personal Protective Equipment

- A. All personnel entering the attic space with known or presumed asbestos containing materials shall wear full body disposable coveralls (e.g., Tyvek, Kleenguard or equivalent) and at a minimum, a half face, tight fitting, elastomeric respirator with HEPA (P-100) filter cartridges for asbestos protection (or a respirator offering greater protection). The individual wearing this respirator must have been fit tested, trained and had medical clearance, pursuant to 8 CCR 5144.

3.07 Entering ceiling spaces where asbestos fire proofing (contaminated with assumed or visible asbestos debris) is present (e.g., when personnel must enter the space and “crawl” in the attic space, but asbestos will likely not be disturbed).

- A. Control of disturbance of asbestos debris during work inside of an attic space shall be followed in all cases, by using a HEPA vacuum to clean-up visible suspect asbestos containing debris in the immediate area of access and work. If practical, vacuum visible debris for the full path of travel. If this is not practical, use other procedures to ensure safe removal of visible debris in the path of travel that would be disturbed by the crawl. For example, wet paper towels and plastic bags may be used to pick up and contain visible debris. The top surface of the attic access panel shall be cleaned of all dust and debris using a wet paper towel before the access hatch panel is allowed to swing down into the suspended position. Other control methods may be used provided they meet the following criteria:
 - a. dry sweeping is not permitted
 - b. employees must not walk on, crawl on or otherwise crush visible suspect asbestos containing debris
 - c. the control method must not result in a release of airborne fibers.
- B. If the coverall tears or rips during the work activity, repair or replacement is required. Use duct tape to repair tears or rips to the coverall if feasible or exit and replace the coverall. Remove and bag coverall in mini-enclosure as in ceiling access procedure. If coveralls were torn, vacuum any

noticeable debris from underlying clothing. Use two disposable coveralls to minimize contamination of street clothes when tearing is likely or when crawling on rough surfaces.

3.08 HEPA Filter Challenge Testing and Certification

- A. All HEPA filtered equipment (including negative air units and vacuums) used must have passed onsite DOP testing within the last 6 months and must be re-certified after filter replacement or if moved offsite, including to another University building.

3.09 Access for Inspection after Ceiling Tile has been Removed

- A. Inspection above the ceiling, after a ceiling tile has been moved using a mini-enclosure containment, may be performed with asbestos awareness training. Access of this type is limited to visual inspection through the ceiling opening. Full entry to the space or ceiling crawl must meet the other requirements of this section. Personnel who perform this work must be notified that asbestos is present in the area and which materials in the area contain asbestos.

3.10 Asbestos Waste Management

- A. Personnel are required to appropriately bag all asbestos debris, disposable personal protective equipment, and other materials potentially contaminated with asbestos. Bags shall be clear, 6 mil, imprinted with the required asbestos warning label. Appropriate packaging includes double-bagging and wetting the materials in the inner bag. Each bag shall be legibly marked with (Site address and Generator Number will change with each project site location) The Generator is UC Davis Health EPA ID No. CAD076124981. The Generator address is 2315 Stockton Blvd., FSSB 2500, Sacramento, CA 95817.
- B. For those projects generating five (5) or fewer bags of asbestos-contaminated materials, University Environmental Health and Safety (EH&S) will manage the disposal of the bags; contact EH&S at 916-734-2740 for disposal with at least one week's notice of the intent to dispose. Materials must be bagged and marked as described above prior to EH&S' acceptance.
- C. Asbestos disposal is the responsibility of the **[Contractor][CM/Contractor][Design-Builder]** on those projects generating more than five (5) bags of asbestos-contaminated material. If a Uniform Hazardous Waste Manifest is required for transportation, such manifest must be signed by a representative of the University EH&S. Contact EH&S with at least one week's notice of the intent to dispose.

SECTION 01 56 26 00 - EROSION AND SEDIMENTATION CONTROLS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of mesh or netting for erosion control. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

1.2 PRODUCTS

A. Materials

1. Jute Mesh: Fed. Spec. CCC-C-467.
2. Plastic Mesh: Manufacturer's recommendation.
3. Plastic Netting: Manufacturer's recommendation.
4. Polypropylene Mesh: Manufacturer's recommendation.
5. Woven Fabric Fence: EPA specifications.
6. Hay-Bales: EPA specifications.

1.3 EXECUTION:

- A. Preparation: Grade, compact, fertilize, and seed the area to be protected.
- B. Installation: Apply blankets either horizontally or vertically to the slope. In ditches, apply blanket in direction of water flow. Lap and anchor blankets according to the manufacturer's instructions. Install woven fabric fence and hay bales adjacent to all excavated areas.

SECTION 01 66 00 00 - MATERIAL AND EQUIPMENT

PART 1 GENERAL

1.01 GENERAL

- A. All material and equipment incorporated in the Work shall be:
 - 1. New.
 - 2. In condition acceptable to University's Representative.
 - 3. Suitable for intended use.
 - 4. Keep materials clean, dry, and undamaged.

1.02 TRANSPORTATION AND HANDLING

- A. Deliver manufactured products in their original unbroken containers or bundles, clearly labeled with manufacturer's name, brand, and grade seal or model number.
- B. Promptly remove damaged or defective products from the site and replace at no increase in Contract Sum.
- C. Handle materials and equipment in a manner to avoid damage to products and their finishes.
- D. Promptly remove damaged or defective products from the Project site and replace with no adjustment of Contract Sum.

1.03 STORAGE AND PROTECTION

- A. Store manufactured products in accordance with manufacturers' instructions and with seals and labels intact and legible.
- B. Store products subject to damage by the elements in weathertight enclosures.
- C. Maintain temperature and humidity in accordance with manufacturers' recommendations.
- D. Exterior Storage (where applicable):
 - 1. Store materials and equipment above ground on blocking or skids to prevent soiling, staining, and damage.
 - 2. Cover products which are subject to damage by the elements with impervious protective sheet coverings. Provide adequate ventilation to prevent condensation.
 - 3. Store sand, rock, or aggregate material in a well-drained area on solid surfaces to prevent mixing with foreign matter.
- E. Source Limitations: To the fullest extent possible, provide products of the same kind from a single source.
- F. Arrange storage to allow adequate inspection.
- G. Periodically inspect stored products to assure that products are maintained under specified conditions and are free from damage and deterioration.
- H. Protection After Installation:
 - 1. Prevent damage to materials and equipment.
 - 2. Use whatever protective materials or methods are necessary to prevent damage to installed products from traffic, construction operations, and weather. Remove protection when no longer required.
 - 3. Maintain temperature and humidity conditions in interior spaces for the Work in accordance with manufacturers' instructions for the materials and equipment being protected.
- I. No storage of equipment, materials, and toolboxes outside the construction barrier will be permitted.

01 - General Requirements

- J. Contractor shall figure staging materials or equipment through an outside warehouse or yard, if at all possible. There is little or no space at the University for storage. Contact the Project Manager/Building Manager for possible staging areas.
- K. Materials, equipment or toolboxes stored in the corridors must be cleared with the CSFM prior to storage. The University will remove items not so authorized after suitable warning.
- L. Store paints or any other combustible materials in the properly rated storage lockers.
- M. Storage: Do not unreasonably encumber the site with materials or equipment. Confine stockpiling of materials to Project Area.
- N. Use protective methods as required to prevent damage to products from traffic, construction operations, weather, and other causes. Remove protection when no longer required.
- O. Maintain temperature and humidity in accordance with manufacturers' written instructions.
- P. Protect the various materials, work, equipment and finishes provided by the several trades from other operations or work in an appropriate manner to ensure they are in satisfactory condition at the Date of Substantial Completion. Final responsibility for protection rests with the Contractor.

1.04 TESTING LABORATORY LABEL

- A. Materials and equipment, for which testing laboratories standards have been established and their label service is available, shall bear the appropriate Label.

1.05 MANUFACTURERS' TRADE MARKS AND NAMES

- A. University's Representative reserves the right to review and request the removal or redesign of manufacturers' trade marks and names on items of materials and equipment which will be exposed to view in the completed Work. Such removal or redesign shall be with no adjustment of Contract Sum.

1.06 MATERIALS AND EQUIPMENT

- A. General: Provide products which comply with specified requirements and which are undamaged and unused at time of installation, and which are complete with accessories, trim, finish, safety provisions and other devices and details needed for a complete installation and for intended use and effect.
- B. Standard Products: Where available, provide standard products of types which have been produced and used previously and successfully on other projects and in similar applications.
- C. Nameplates: Except as otherwise noted for required approval, ensure labels and operating data do not permanently attach or imprint manufacturer's, or producer's, nameplates or trademarks on surfaces of products which will be exposed to view, either in occupied spaces or on exterior of Work.

1.07 INSTALLATION OF PRODUCTS

- A. Comply with manufacturer's instructions and recommendations for installation of products in applications indicated. Accurately locate and secure each product.

PART 2 PRODUCTS (NOT USED)

PART 3 EXECUTION (NOT USED)

END OF SECTION 01 66 00 00

SECTION 01 66 00 00a - PRODUCT OPTIONS AND SUBSTITUTIONS

PART 1 GENERAL

1.01 General Provisions Regarding Specification Of Products, Material or Equipment By Brand Or Trade Name.

- A. Products, material or equipment specified by both brand or trade name and model number are approved for use, provided that Contractor complies with all Contract requirements. Specification of a product, material or equipment by brand or trade name and model number is not a representation or warranty that the product, material or equipment can be used without modification, to meet the requirements of the plans and specifications; Contractor shall, at its sole cost, modify such products, material, or equipment so that they comply with all requirements of the plans and specifications.
- B. The first-named product, material or equipment specified by brand or trade name and model number is the basis for the Project design and the use of any item other than the first-named one may require modifications of that design. If Contractor uses any product, material or equipment other than the first-named one, Contractor shall, at its sole cost:
 - 1. Make all revisions and modifications to the design and construction of the Work necessitated by the use of the product, material or equipment.
 - 2. Be responsible for all costs of any changes resulting from the use of the product, material or equipment including without limitation, costs or changes which affect other parts of the Work, the work of Separate Contractors, or any other property or operations of the University.
- C. When a product, material or equipment specified by brand or trade name is followed by the words "or equal," a substitution may be permitted if the substitution is equal to or superior to the first-named product, material or equipment in quality, utility and appearance and if the substitution complies with all other requirements of the plans and specifications.
- D. A product, material or equipment specified by brand or trade name followed by the words "or equal, no known equal," signifies that University does not have sufficient knowledge to specify a product, material or equipment, other than the one specified by brand or trade name, that is suitable for use on the Project. The use of the words "no known equal" is not intended to discourage substitution requests in accordance with the requirements specified herein.
- E. When catalog numbers and specific brands or trade names not followed by the designation "or equal" are used in conjunction with a product, material or equipment required by the specifications, substitutions will not be allowed and the named product, material or equipment must be used.
- F. Specification of a product, material or equipment by brand or trade name and model number is not a representation or warranty that the product, material or equipment is available; Contractor should confirm, prior to submitting its Bid, the availability of any product, material or equipment specified by brand or trade name and model number.

1.02 Special Requirements For Products, Material Or Equipment, Other Than The First-Named Product, Material Or Equipment, Specified By Both Brand Or Trade Name And Model Number.

- A. In addition to complying with all other submittal requirements of the Contract, submit within 70 days after the date of commencement specified in the Notice to Proceed, for review and approval by the University's Representative, Contractor prepared specifications and drawings, including design and engineering calculations, prepared by an appropriate licensed professional, depicting all revisions and modifications to the design and construction of the Work necessitated by the use of the product, material

or equipment. If no revisions or modifications are necessary, submit within 70 days after the date of commencement specified in the Notice to Proceed, a written representation that no revisions or modifications to the design or construction of the Work are necessitated by the use of the product, material or equipment. Contractor shall utilize the first-named product, material or equipment if Contractor fails to make the appropriate required submittal pursuant to this paragraph within the 70-day period.

- B. A product, material or equipment, other than the first-named product, material or equipment, specified by both brand or trade name and model number may be used if no revisions or modifications to the design or construction of the Work are necessitated by the use of the product, material or equipment. If such revisions or modifications are necessary, the product, material or equipment may be used only if the revisions or modifications are approved in writing by the University's Representative. Contractor has the burden of demonstrating, through the procedures specified herein, that any such revisions or modifications will not be detrimental to the quality, utility or appearance of the Project or any portion of the Project. The University's Representative may refuse to approve any such proposed revisions or modifications where, in the reasonable opinion of the University's Representative, Contractor has failed to demonstrate, through the procedures specified herein, that the revisions or modifications are not detrimental to the quality, utility or appearance of the Project or any portion of the Project.

1.03 Special Requirements For Substitutions.

- A. In addition to complying with all other submittal requirements of the Contract, submit written data demonstrating that the proposed substitution is equal to or superior to the first-named product, material or equipment in quality, utility and appearance and otherwise complies with all requirements of the plans and specifications, including:
 - 1. Complete technical data including drawings, performance specifications, samples, and test reports of the article proposed for substitution.
 - 2. Statement by Contractor that the proposed substitution is in full compliance with the requirements of the Contract Documents and Applicable Code Requirements.
 - 3. List of Subcontractors, if any, that may be affected by the substitution.
 - 4. Contractor prepared specifications and drawings, including design and engineering calculations, prepared by an appropriately licensed professional, depicting all revisions and modifications to the design and construction of the Work necessitated by the use of the substitution. If no revisions or modifications are necessary, submit a written representation that no revisions or modifications to the design or construction of the Work are necessitated by the use of the product, material or equipment.
- B. At the request of and within the timeframes specified by the University's Representative:
 - 1. Submit samples as deemed necessary by the University's Representative to evaluate the proposed substitution.
 - 2. Submit proposed substitution to tests deemed necessary by the University's Representative to evaluate the proposed substitution. Such tests shall be made by an independent Testing Laboratory and at the sole expense of Contractor, after review and approval of the test procedures by University's Representative. If re-testing is deemed necessary by the University's Representative to evaluate the proposed substitution, such re-testing shall be made by an independent Testing Laboratory at the sole expense of the Contractor.
 - 3. Provide any additional information deemed necessary by the University's Representative to evaluate the proposed substitution.

- C. If University's Representative, in reviewing a proposed substitution, requires revisions or corrections to be made to previously accepted shop drawings and supplemental supporting data to be resubmitted, Contractor shall do so within the time period specified by the University's Representative. A proposed substitution may be rejected if Contractor fails to submit such revisions, corrections, or supplemental supporting data within the specified time period.
- D. Except for products, material or equipment designated in the Bidding Documents for evaluation of substitutions prior to award, requests for substitution, including the data required by Paragraph 1.3.A, must be submitted to the University's Representative not later than 35 days after the date of commencement specified in the Notice to Proceed. No requests for substitutions of products, material or equipment subject to the 35-day deadline shall be considered unless the request and supporting data is submitted on or before the deadline, except those deemed, in University's Representative's sole opinion, to be necessary because (i) previously specified or approved manufactured products, material or equipment are no longer manufactured, (ii) of University initiated change orders, or (iii) it is in the best interest of University to accept such substitution.
- E. If a product, material or equipment is designated in the Bidding Documents for evaluation of substitutions prior to award, then a request for substitution of the product, material or equipment, including the data required by Paragraph 1.03.A, must be submitted by the deadline specified in the Bidding Documents. Because of time constraints, only one submittal will be allowed for each such substitution request. Requests for substitutions of products, material or equipment designated for evaluation prior to award may not be made after the deadline specified in the Bidding Documents, and such requests shall not be considered unless the request and supporting data is submitted on or before the deadline specified in the Bidding Documents. Notwithstanding the forgoing, the University may consider, after award of the Contract, requests for substitution of a product, material or equipment designated for evaluation prior to award where, in University's Representative's sole opinion, a substitution is necessary because (i) previously specified or approved manufactured products, material or equipment are no longer manufactured, (ii) of University initiated change orders, or (iii) it is in the best interest of University to accept such substitution.
- F. In reviewing the supporting data submitted for substitutions, University's Representative will use, for purposes of comparison, all the characteristics of the specified material or equipment as they appear in the manufacturer's published data even though all the characteristics may not have been particularly mentioned in the Specifications. If more than 2 submissions of supporting data are required, the cost of reviewing the additional supporting data shall be at Contractor's expense.
- G. Contractor has the burden of demonstrating, through the procedures specified herein, that its proposed substitution is equal to or superior to the first-named product, material or equipment in quality, utility and appearance and complies with all other requirements of the plans and specifications. If revisions or modifications to the design or construction of the work are necessitated by the use of the substitution, Contractor also has the burden of demonstrating, through the procedures specified herein, that the use of the substitution will not be detrimental to the quality, utility or appearance of the Project or any portion of the Project.
- H. The University's Representative may refuse to approve any requested substitution where, in the reasonable opinion of the University's Representative, Contractor has failed to demonstrate, through the procedures specified herein, that the proposed substitution is equal to, or superior to, the first-named product, material or equipment, in quality, utility and appearance and that the proposed substitution complies with all other requirements of the plans and specifications.
- I. University's Representative may reject any substitution not proposed in the manner and within the time limits prescribed herein.
- J. Substitutions are not allowed unless approved in writing by the University's Representative. Any such approval shall not relieve Contractor from the requirements of the Contract Documents.

01 - General Requirements

- K. The 35-day and 70-day submittal periods do not excuse Contractor from completing the Work within the Contract Time or excuse Contractor from paying liquidated damages if Final Completion is delayed.
- L. If revisions or modifications to the design or construction of the Work are necessitated by the use of a substitution, the substitution may be used only if the revisions and modifications are approved in writing by the University's Representative. The University's Representative may refuse to approve any such proposed revisions or modifications where, in the reasonable opinion of the University's Representative, Contractor has failed to demonstrate, through the procedures specified herein, that the revisions or modifications are not detrimental to the quality, utility and appearance of the Project or any portion of the Project.
- M. If a substitution request is finally rejected by the University Representative, Contractor shall furnish and install:
 - 1. the first-named product, material, or equipment; or
 - 2. a product, material, or equipment, other than the first-named product, material or equipment, specified by both brand or trade name and model number, provided Contractor complies with the submittal requirements (including deadlines) of specification section 01640-1.02

PART 2- PRODUCTS-NOT USED

PART 3-EXECUTION

- A. Exhibit: Material Substitution Proposal Form

MATERIAL SUBSTITUTION PROPOSAL

To: Name:

Project:

Project No.:

A. We hereby submit for your consideration the following product instead of the specified item:

1. Section _____ Article Number _____
2. Specified Item _____
3. Proposed Substitution (Mfg., Type, Model, etc.) _____

B. Complete all of the following:

1. Does this substitution offer University a cost credit (including costs for changes by other subcontractors)? ____ Yes ____ No How much? _____
2. Does this substitution offer earlier delivery or less Contract Time? ____ Yes ____ No How much and why? _____
3. How does this substitution affect any dimensions, layout, or details of other subcontractors as shown on the Drawings?

4. What are the specific differences between this substitution and the specified item?

C. Attach the following as applicable (Check if attached)

1. Manufacturer's technical data _____
2. Laboratory test or performance results _____
3. Drawings & wiring diagrams of the proposed product _____
4. Drawings & description of changes required by other subcontractors _____
5. Samples _____
6. Manufacturer's guarantee & maintenance instructions _____

D. Submitted by Contractor: _____
Signature: _____ Date: _____

For Use Only by University's Representative

SECTION 01 70 00 00 - PROJECT CLOSEOUT

PART 1 GENERAL

1.01 PREREQUISITES TO COMPLETION:

- A. General: Complete the following before requesting University's Representative's inspection for Certification of Completion, either for entire Work or for portions of the Work. List known exceptions in the request.
 - 1. In the progress payment request that coincides with, or is the first request following, the date claimed, list incomplete items, the value of incomplete work, and reasons for Work being incomplete.
 - a. Submit a statement showing an accounting of changes to the Contract Sum.
 - 2. Include supporting documentation for completion as indicated in these contract documents.
 - 3. Submit specific Warranties, Final Certifications, and similar documents.
 - 4. Deliver tools, spare parts, extra stock of material, and similar physical items to the University.
 - 5. Make final change-over of locks and transmit keys to the University.
 - 6. Advise University's personnel of the change-over in security provisions.
 - 7. Complete start-up testing of systems, and instructions to the University's operating and maintenance personnel.
 - 8. Discontinue or change over and remove temporary facilities and services from the project site, along with construction tools and facilities, mock-ups, and similar elements.
 - 9. Complete final cleaning requirements, including touch-up painting of marred surfaces.

1.02 PREREQUISITES FOR ACCEPTANCE

- A. Submit a certified copy of the final Inspection Report of itemized work to be completed or corrected. State that each item has been completed or otherwise resolved for acceptance and has been endorsed and dated by the University's Representative.
- B. Inspection Procedure: The University's Representative will re-inspect the Work upon receipt of the Contractor's notice that the work, including "punch list" items resulting from earlier inspections, has been completed.
- C. Upon completion of inspection, the University's Representative will either prepare a certificate of final acceptance, or will advise the Contractor of work that is incomplete or of obligations that have not been fulfilled but are required for final acceptance.
- D. If necessary, the inspection procedure will be repeated.
- E. Final "Punch List" items shall be completed within 14 days after date of issuance of final "punch list". Any items left incomplete after that date will be completed by the University under separate contract and costs deducted from amounts due to Contractor under this Contract.

1.03 CLOSEOUT SUBMITTALS

- A. Submit written certification that Contract Documents have been reviewed, Work has been inspected and full-functional testing completed, and that Work is complete in accordance with Contract Documents and ready for University's Representative review.
- B. Provide submittals to University's Representative that are required by governing or other authorities.
- C. Submit Final Application for Payment identifying total adjusted Contract Sum, previous payments, and sum remaining due.
- D. Submit specific Warranties, Final Certifications, and similar documents.

1.04 FINAL CLEANING

- A. See Section 01710 Clean-up and Disposal.

1.05 PROJECT RECORD DOCUMENTS

- A. Maintain during construction period, on site, one set of the following record documents; record actual revisions to the Work:
 - 1. Contract Drawings
 - 2. Contract Specifications
 - 3. Addenda
 - 4. Executed Change Orders and other modifications to the Contract.
 - 5. Reviewed Shop Drawings, Product Data, and Samples
 - 6. Manufacturer's Instructions for assembly, installation, and adjusting.
- B. Ensure entries are complete and accurate, enabling future reference by University.
- C. Store record documents separate from documents used for construction.
- D. Record information concurrent with construction progress.
- E. Record Specifications - legibly mark and record at each product section description of actual products installed, including the following:
 - 1. Manufacturer's name and product model and number
 - 2. Product substitutions or alternates utilized
 - 3. Changes made by Addenda, Change Orders, or other modifications.
- F. Record Documents and Shop Drawings: Legibly mark each item to record actual construction, including:
 - 1. Measured horizontal and vertical locations of below slab utilities and appurtenances, referenced to permanent surface improvements.
 - 2. Measured locations of internal utilities and appurtenances concealed in construction, referenced to visible and accessible features of the Work.
 - 3. Field changes of dimension and detail.
 - 4. Details not on original Contract Drawings.
- G. Stamp Record Drawings and Specifications cover sheet with "RECORD DOCUMENTS" for identification.
- H. Submit documents to University's Representative prior to Request for Final Application for Payment.
- I. University will, at no cost, provide the Contractor with a set of reproducible Drawings of the original Contract Documents, which shall be used for recording the "As Built" condition of the Work.
- J. Record the following kinds of information on the Record Document Drawings:
 - 1. Locations of Work buried under or outside the building, such as plumbing and electrical lines and conduits. Provide horizontal and vertical dimensions from fixed points.
 - 2. Actual numbering of each electrical circuit.
 - 3. Locations of all significant Work concealed inside the building, the locations of which are changed by the Contractor from those shown on the Drawings.
 - 4. Locations of all items, not necessarily concealed, which vary from the locations shown on the Drawings.
 - 5. Provide reflected ceiling plan with log list of junction boxes and valve numbers, functions and locations, keyed to numbered access panels identified on the plan.
- K. Record Drawings shall be done carefully and neatly by a competent drafter, familiar with the trade involved. Drawings shall be made using methods acceptable to the University's Representative and shall be available to the University at any time.
- L. Drawings shall be kept up to date during the entire progress of the Work, a condition required for processing monthly progress payments. Drawings shall be reviewed and approved by the University's

Representative prior to ceiling close-up.

- M. Record all changes in size, location, and other features of installation shown on the Drawings.
- N. Record sufficient information so Work concealed in the building may be located with reasonable ease and accuracy. Accomplish by dimensioning or by stating the relationship to spaces in the building near which Work was installed. University Representative's decision on what constitutes sufficient information shall be final.
- O. Contractor shall deliver as-built Record Documents in "Autocad" Computer Aided Design (CAD) Format, as well as in reproducible Drawing Format, prior to submitting for final payment.
- P. Shop Drawings: Provide reproducible record drawings, made from final Shop Drawings which have been updated to show actual conditions, for Work specified in the individual specification Sections.
- Q. Specifications and Addenda. Record the following:
 - 1. Manufacturer, trade name, catalog number, and supplier of each product and item of equipment actually installed.
 - 2. Changes made by Addenda, Change Orders, or Field Orders, and Clarifications and Interpretations made by Letters of Instruction.
- R. Large-Scale Layout Drawings: DIVISIONS 15 and 16 of Specifications require preparation of large-scale, detailed layout drawings of the Work of those DIVISIONS. These layout drawings are not Shop Drawings as defined by the GENERAL CONDITIONS, but, together with Shop Drawings or layout drawings of all other affected specification Sections, are used to check, coordinate, and integrate Work of various Sections. Maintain and submit these layout drawings as part of the Project Record Documents.
- S. Record Documents are subject to review and acceptance by University's Representative. At completion of project, transfer all as-built information to reproducible and submit to University's Representative for final records.

1.06 OPERATION AND MAINTENANCE DATA

- A. Submit data on 8-1/2 x 11 inch text pages, bound in three-D side-ring binders with durable covers and CD.
- B. Prepare binder cover with printed title "OPERATION AND MAINTENANCE INSTRUCTIONS", title of project, and subject matter of binder when multiple binders are required.
- C. Internally subdivide the binder contents with permanent page dividers, logically organized as described below, with tab titling clearly printed under reinforced laminated plastic tabs.
- D. Contents - prepare a Table of Contents for each volume, with each product or system description identified, typed or printed on 24 pound white paper, in three parts as follows:
 - 1. Part 1: Directory, listing names, addresses, and telephone numbers of University's Representative, Contractor, subcontractors and major equipment suppliers.
 - 2. Part 2: Operation and maintenance instructions arranged by system and subdivided by specification section, including a sequence of operations for systems. For each category, identify names, addresses, and telephone numbers of subcontractors and suppliers. Identify the following:
 - a. Significant design criteria.
 - b. List of equipment.
 - c. Parts list for each component.
 - d. Operating instructions.
 - e. Maintenance instructions for equipment and systems.
 - f. Maintenance instructions for finishes, including recommended cleaning methods and materials, and special precautions identifying detrimental agents.
 - 3. Part 3: Project documents and certificates, including the following:
 - a. Shop drawings and product data.
 - b. Air and water balance reports.
 - c. Certificates,

01 - General Requirements

d. Photocopies of warranties and bonds.

- E. Submit one (1) draft copy of completed volumes 15 days prior to final inspection. This copy will be reviewed and returned after final inspection, with University's Representative's comments. Revise content of all document sets as required prior to final submission.
- F. Submit two (2) sets of revised final volumes and one (1) CD prior to Request for Final Application for Payment.
- G. Work requiring instruction of University's Personnel is specified in the individual Sections of specifications.
- H. Schedule an Instructional Meeting or Meetings 2 weeks after instructional manuals have been submitted, reviewed, and accepted by University's Representative.
- I. Upon University's taking beneficial occupancy, or after final acceptance, whichever is earlier, fully qualified representatives of the manufacturers shall fully instruct University's designated operating and maintenance personnel in the operation, adjustment, and maintenance of all equipment and systems.
- J. Basis of Instruction: Operating and Maintenance Manual. Review contents of Manual with personnel in full detail to explain all aspects of Operations and Maintenance.

1.07 WARRANTIES

- A. See Section 01740 - Guarantees, Warranties, Bonds Service and Maintenance Contracts.

1.08 SPARE PARTS, MAINTENANCE MATERIALS AND EXTRA MATERIAL

- A. Provide products, spare parts, maintenance and extra materials in quantities specified in individual specification sections.
- B. Deliver to Project site, place in location as directed, and obtain receipt prior to Request for Final Application for Payment.
- C. Label each container with project name and number, manufacturer number and color.
- D. Package with protective coating for storage.

1.09 TRAINING

- A. Provide and complete all training as specified in individual specification sections prior to Request for Final Application for Payment.

1.10 CLOSEOUT PROCEDURES

- A. General Operating and Maintenance Instructions: Meet at the site with the University's personnel to provide necessary basic instruction in the proper operation and maintenance of the entire Work.

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION

- A. ALL WARRANTIES, MANUALS, AND AS-BUILT SUBMITTALS TO BE PROVIDED TO THE UNIVERSITY XX DAYS AFTER CONSTRUCTION COMPLETION.

SECTION 01 71 23 16 - CUTTING AND PATCHING

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for cutting and patching. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes procedural requirements for cutting and patching.

C. Definitions

1. Cutting: Removal of in-place construction necessary to permit installation or performance of other Work.
2. Patching: Fitting and repair work required to restore surfaces to original conditions after installation of other Work.

D. Submittals

1. Cutting and Patching Proposal: Submit a proposal describing procedures at least 10 days before the time cutting and patching will be performed, requesting approval to proceed. Include the following information:
 - a. Extent: Describe cutting and patching, show how they will be performed, and indicate why they cannot be avoided.
 - b. Changes to In-Place Construction: Describe anticipated results. Include changes to structural elements and operating components as well as changes in building's appearance and other significant visual elements.
 - c. Products: List products to be used and firms or entities that will perform the Work.
 - d. Dates: Indicate when cutting and patching will be performed.
 - e. Utility Services and Mechanical/Electrical Systems: List services/systems that cutting and patching procedures will disturb or affect. List services/systems that will be relocated and those that will be temporarily out of service. Indicate how long services/systems will be disrupted.
 - f. Structural Elements: Where cutting and patching involve adding reinforcement to structural elements, submit details and engineering calculations showing integration of reinforcement with original structure.
 - g. the Owner's Approval: Obtain approval of cutting and patching proposal before cutting and patching. Approval does not waive right to later require removal and replacement of unsatisfactory work.

E. Quality Assurance

1. LEED Requirements for Building Reuse:
 - a. Credit MR 1.1 and 1.2, **as directed**: Maintain existing building structure (including structural floor and roof decking) and envelope (exterior skin and framing, excluding window assemblies and nonstructural roofing material) not indicated to be removed; do not cut such existing construction beyond indicated limits.
 - b. Credit MR 1.3: Maintain existing interior nonstructural elements (interior walls, doors, floor coverings, and ceiling systems) not indicated to be removed; do not cut such existing construction beyond indicated limits.
 - c. Credit MR 1.2 and 1.3, **as directed**: Maintain existing nonshell, nonstructural components (walls, flooring, and ceilings) not indicated to be removed; do not cut such existing construction beyond indicated limits.

01 - General Requirements

2. Structural Elements: Do not cut and patch structural elements in a manner that could change their load-carrying capacity or load-deflection ratio.
 - a. **Refer to the Owner for list of elements that might otherwise be overlooked as structural elements and that require Architect's or Construction Manager's approval of a cutting and patching proposal.**
3. Operational Elements: Do not cut and patch operating elements and related components in a manner that results in reducing their capacity to perform as intended or that results in increased maintenance or decreased operational life or safety. Operating elements include the following:
 - a. Primary operational systems and equipment.
 - b. Air or smoke barriers.
 - c. Fire-suppression systems.
 - d. Mechanical systems piping and ducts.
 - e. Control systems.
 - f. Communication systems.
 - g. Conveying systems.
 - h. Electrical wiring systems.
 - i. Operating systems of special construction in Division 13.
4. Miscellaneous Elements: Do not cut and patch miscellaneous elements or related components in a manner that could change their load-carrying capacity, that results in reducing their capacity to perform as intended, or that results in increased maintenance or decreased operational life or safety. Miscellaneous elements include the following:
 - a. Water, moisture, or vapor barriers.
 - b. Membranes and flashings.
 - c. Exterior curtain-wall construction.
 - d. Equipment supports.
 - e. Piping, ductwork, vessels, and equipment.
 - f. Noise- and vibration-control elements and systems.
5. Visual Requirements: Do not cut and patch construction in a manner that results in visual evidence of cutting and patching. Do not cut and patch construction exposed on the exterior or in occupied spaces in a manner that would, in Architect's opinion, reduce the building's aesthetic qualities. Remove and replace construction that has been cut and patched in a visually unsatisfactory manner.
6. Cutting and Patching Conference: Before proceeding, meet at Project site with parties involved in cutting and patching, including mechanical and electrical trades. Review areas of potential interference and conflict. Coordinate procedures and resolve potential conflicts before proceeding.

F. Warranty

1. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during cutting and patching operations, by methods and with materials so as not to void existing warranties.

1.2 PRODUCTS

A. Materials

1. General: Comply with requirements specified in other Sections.
2. In-Place Materials: Use materials identical to in-place materials. For exposed surfaces, use materials that visually match in-place adjacent surfaces to the fullest extent possible.
 - a. If identical materials are unavailable or cannot be used, use materials that, when installed, will match the visual and functional performance of in-place materials.

1.3 EXECUTION

A. Preparation

1. Temporary Support: Provide temporary support of Work to be cut.
2. Protection: Protect in-place construction during cutting and patching to prevent damage. Provide protection from adverse weather conditions for portions of Project that might be exposed during cutting and patching operations.
3. Adjoining Areas: Avoid interference with use of adjoining areas or interruption of free passage to adjoining areas.
4. Existing Utility Services and Mechanical/Electrical Systems: Where existing services/systems are required to be removed, relocated, or abandoned, bypass such services/systems before cutting to minimize **OR** prevent, **as directed**, interruption to occupied areas.

B. Performance

1. General: Employ skilled workers to perform cutting and patching. Proceed with cutting and patching at the earliest feasible time, and complete without delay.
 - a. Cut in-place construction to provide for installation of other components or performance of other construction, and subsequently patch as required to restore surfaces to their original condition.
2. Cutting: Cut in-place construction by sawing, drilling, breaking, chipping, grinding, and similar operations, including excavation, using methods least likely to damage elements retained or adjoining construction. If possible, review proposed procedures with original Installer; comply with original Installer's written recommendations.
 - a. In general, use hand or small power tools designed for sawing and grinding, not hammering and chopping. Cut holes and slots as small as possible, neatly to size required, and with minimum disturbance of adjacent surfaces. Temporarily cover openings when not in use.
 - b. Finished Surfaces: Cut or drill from the exposed or finished side into concealed surfaces.
 - c. Concrete and Masonry: Cut using a cutting machine, such as an abrasive saw or a diamond-core drill.
 - d. Excavating and Backfilling: Comply with requirements in applicable Division 31 where required by cutting and patching operations.
 - e. Mechanical and Electrical Services: Cut off pipe or conduit in walls or partitions to be removed. Cap, valve, or plug and seal remaining portion of pipe or conduit to prevent entrance of moisture or other foreign matter after cutting.
 - f. Proceed with patching after construction operations requiring cutting are complete.
3. Patching: Patch construction by filling, repairing, refinishing, closing up, and similar operations following performance of other Work. Patch with durable seams that are as invisible as possible. Provide materials and comply with installation requirements specified in other Sections.
 - a. Inspection: Where feasible, test and inspect patched areas after completion to demonstrate integrity of installation.
 - b. Exposed Finishes: Restore exposed finishes of patched areas and extend finish restoration into retained adjoining construction in a manner that will eliminate evidence of patching and refinishing.
 - 1) Clean piping, conduit, and similar features before applying paint or other finishing materials.
 - 2) Restore damaged pipe covering to its original condition.
 - c. Floors and Walls: Where walls or partitions that are removed extend one finished area into another, patch and repair floor and wall surfaces in the new space. Provide an even surface of uniform finish, color, texture, and appearance. Remove in-place floor and wall coverings and replace with new materials, if necessary, to achieve uniform color and appearance.
 - 1) Where patching occurs in a painted surface, apply primer and intermediate paint coats over the patch and apply final paint coat over entire unbroken surface containing the patch. Provide additional coats until patch blends with adjacent surfaces.

- d. Ceilings: Patch, repair, or rehang in-place ceilings as necessary to provide an even-plane surface of uniform appearance.
 - e. Exterior Building Enclosure: Patch components in a manner that restores enclosure to a weathertight condition.
4. Cleaning: Clean areas and spaces where cutting and patching are performed. Completely remove paint, mortar, oils, putty, and similar materials.

END OF SECTION 01 71 23 16

Task	Specification	Specification Description
01 71 23 16	01 00 00 00	GENERAL REQUIREMENTS
01 71 36 00	01 00 00 00	GENERAL REQUIREMENTS

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 74 00 00 - CLEAN-UP AND DISPOSAL

PART 1 GENERAL

1.01 GENERAL

- A. Contractor shall confine its operations to areas permitted by the Contract Documents and keep the Project site clean and free from unreasonable accumulation of excess dirt, materials, or waste caused by Contractor.
- B. Corridors shall be kept clean and clear at all times. All matters related to construction shall be conducted so as to cause the least possible interference with the Medical Center's normal use of the premises, including, but not limited to, emergency egress and operations.
- C. Debris Collection and Removal: No space exists for Contractor debris box. Limited access is permitted to the existing loading dock. Loading, unloading, and hoisting activities must be coordinated with University's operations. Conflicts with regard to space will favor the University. The use of helicopters is prohibited.

1.02 DUST CONTROL

- A. Contractor shall construct the proper barricade as described in Section 01520- Fire Safety and approved by the California State Fire Marshal (CSFM).
- B. Where use of polyethylene is permitted, it shall be fire retardant type, approved by CSFM.
- C. Barricaded areas are subject to unscheduled inspections to ensure that compliance with cleaning requirements is maintained.

1.03 WORK WITHIN OCCUPIED OFFICES OR LABORATORIES

- A. The University will arrange to move chemicals, freezers, incubators, and other major equipment out of the way.
- B. The contractor shall cover everything with lightweight visqueen or other approved material, and protect vibration sensitive and other designated equipment left in place with plywood or similar covering.
- C. The contractor shall thoroughly clean the room after work is complete. This includes carefully removing the polyethylene or other coverings and wet mopping the floor and wiping down any exposed counters that were soiled.

1.04 FINAL CLEANING

- A. Execute final cleaning prior to final project inspection.
- B. Clean all new exterior and all interior glass, new and existing surfaces; remove temporary labels, stains, and foreign substances; polish transparent and glossy surfaces; vacuum carpeted and soft surfaces.
- C. Clean equipment and fixtures with cleaning materials appropriate to the surface and material being cleaned.
- D. Replace filters of all new and/or modified operating equipment within the construction area.
- E. Clean debris from all drainage systems both new and existing.
- F. Remove waste and surplus materials, rubbish, and temporary construction facilities from the project site.
- G. Failure to remove items as specified will result in payment being withheld until removal is accomplished.

1.05 CONSTRUCTION CLEANLINESS ENFORCEMENT

- A. Failure to follow the Contract Documents may result in shutdown of the project and/or warnings and

01 - General Requirements

finer. The first offense will result in a warning from the representatives of the University. Second and subsequent infractions will result in a fine of not less than \$1,000 and up to \$5000. (Except in the case of a violation of the Ceiling Access Policy section, which has, its own penalty clause) Additionally the offending contractor's status as a responsible contractor for bidding future work, may be affected.

- B. If a dispute arises regarding the Contractor as to the responsibility under the respective contract for maintaining the Project site and surrounding areas free from waste materials and rubbish, University may clean the site and deduct the cost from the contract amount at the then prevailing recharge rates in use at the University.

1.06 RECYCLING

- A. The University is committed to reducing the amount of materials sent to landfills. To that end, contractors at University projects are encouraged to use waste hauling companies that separate recyclable materials. The following firms have been identified as having refuse separation facilities:
 1. Golden Gate Disposal and Recycling Company (415) 575-2467.
 2. Sunset Scavenger Company (415) 330-8434.

1.07 PREPARATION

- A. Protective Measures: A mask, disposable white coverall, and disposable shoe covers must be worn when investigating conditions above the ceiling.
- B. Disposable Procedures:
 1. After the above ceiling investigation, and before leaving the enclosure tunnel or shroud, the mask, coverall, and shoe covers must be carefully removed and deposited into a plastic trash bag. The coveralls are to be turned inside-out.
 2. Secure plastic trash bag by tying off. Discard trash bags as directed by University's Representative. Do not discard trash bags within any patient care area.

1.08 GENERAL CLEANING

- A. During handling and installation of work at the project site, clean and work in progress and adjoining work on the basis of continuous maintenance.
- B. Clean and perform maintenance on installed work as frequently as necessary through remainder of the construction period. Adjust and lubricate operable components to ensure operability without damaging effects.
- C. Standard for cleaning Work: comply with requirements of Section 01710 throughout the project and Section 01700 for final cleaning requirement in conjunction with cutting and patching activities.
- D. Clean areas and spaces where work is performed and used for access to work. Remove paint, mortar, oils, putty and items of similar nature. clean ducts, pipes, conduit and similar features before finishes are applied. Restore damaged pipe covering to its original condition.
 1. Remove dirt and debris from concealed areas exposed by cutting and patching work regardless of whether the area will be left exposed or concealed when work is completed.
 2. Thoroughly clean spaces where work has been performed or used for access to work.
 3. Completely remove paint, mortar, oils, putty, and materials of similar nature.
 4. Thoroughly clean piping, conduit, and similar items, before painting or other finishing is applied.
 5. Remove debris daily. Remove debris which must be transported through public corridors in accordance with the hours specified in Section 01044.
 6. Debris Containers:
 - a. Transport removal of debris in tightly sealed, covered, rubber tired containers.
 - b. Fit containers with clean polyethylene covers completely sealed at perimeters by taping or tying with wire.
 - c. Wipe containers clean before leaving construction area to prevent tracking of dust.
 7. Place rugs inside and outside construction barrier entrances and keep them clean, or replace them each day.
 8. Place covers over debris boxes between periods when they are being filled.

- E. Keep barricaded areas in a neat, clean, and dust tight condition at all times. Ensure adequate workers, cleaning materials, and equipment are always available.
- F. Vacuum carpets inside barricade vestibules and occupied areas daily with certified HEPA-filtered vacuum cleaner.
- G. Barricaded areas are subject to un-scheduled inspections to ensure compliance with cleaning requirement are maintained.
- H. Legally and properly dispose of debris resulting from removal and reconditioning operations.
- I. Contractor shall clean the path of travel utilized by the Contractor to access the project area, and areas immediately outside the project area, on a daily basis. No construction materials or equipment can be left outside the project area. Contractor shall make a good faith effort to maintain a high degree of cleanliness outside the immediate project area to a standard acceptable to the University. Failure to do so will result in Contractor being charged for University's in-house janitorial services at the minimum rate of \$70.00 per hour.
- J. General Cleaning during the regular progress of the Work is required by the General Conditions.
- K. Special Cleaning: Requirements for specific units of Work are included in appropriate Sections.
 - 1. Final Cleaning: Perform final cleaning of the Work at the time scheduled. Employ experienced workers or professional cleaners for final cleaning. Clean each surface or unit of work to the condition expected from a normal, commercial building cleaning and maintenance program. Comply with manufacturer's written instructions for operations.
 - 2. Complete the following cleaning operations before requesting University's Representative Inspection for Certification of Completion.
 - a. Remove labels which are not required as permanent labels.
 - b. Clean transparent materials, including mirrors and glass in doors and windows, to a polished condition. Remove putty and other substances which are noticeable as vision-obscuring materials. Replace chipped or broken glass and other damaged transparent materials.
 - c. Clean exposed exterior and interior hard-surfaced finishes to a dust-free condition, free of dust, stains, films, and similar noticeable distracting substances. Restore reflective surfaces to their original reflective condition. Leave concrete floors broom clean. Vacuum carpeted surfaces.
 - d. Wipe surfaces of mechanical and electrical equipment clean. Remove excess lubrication and other substances. Clean plumbing fixtures to a sanitary condition. Clean light fixtures and lamps.
 - e. Clean the project site of rubbish, litter, and other foreign substances. Sweep paved areas to a broom-clean condition. Remove stains, spills, and other foreign deposits.
 - f. Clean and polish aluminum portions of windows remaining in place.
 - g. Removal of Protection: Except as otherwise indicated or requested by the University's Representative remove temporary protection devices and facilities which were installed during the course of the work to protect previously completed work during the remainder of the construction period.
 - h. Compliance: Comply with safety standards and governing regulations for cleaning operations. Do not burn waste materials at the site. Do not bury debris or excess materials on the University's property. Do not discharge volatile or other harmful or dangerous materials into drainage systems. Remove waste materials from the site and dispose of in a lawful manner.

PART 2 PRODUCTS-NOT USED

PART 3 EXECUTION-NOT USED

END OF SECTION 01 74 00 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 01 74 00 00a - GUARANTEES, WARRANTIES, BONDS SERVICE AND MAINTENANCE

PART 1 GENERAL

1.01 GENERAL

- A. Guarantees from Subcontractors shall not limit Contractor's warranties and guarantees to University. Whenever possible, Contractor shall cause warranties of Subcontractors to be made directly to University. If such warranties are made to Contractor, Contractor shall assign such warranties to University prior to final payment.

1.02 FORM OF GUARANTEE

- A. Submit written guarantees, in the form contained at the end of this Section. Include University project number and all OSHPD permit number on all documents

1.03 SUBMITTAL REQUIREMENTS

- A. Assemble required guarantees, bonds, and service and maintenance contracts from subcontractor, suppliers and manufacturers.
- B. Number of original signed copies required: 2 each.
- C. Table of Contents: Neatly typed and in orderly sequence. Provide complete information for each item as follows:
 - 1. Product or Work item.
 - 2. Firm name, address, and telephone number; and name of principal.
 - 3. Scope.
 - 4. Date of beginning of guarantee, bond, or service and maintenance contract.
 - 5. Duration of guarantee, bond, or service and maintenance contract. Minimum of one year after issuance of Final Completion document or longer as required under specific Sections or drawings.
 - 6. Contractor's name, address, and telephone number; and name of principal.
 - 7. Provide information for University's personnel:
 - a. Proper procedure in case of failure.
 - b. Circumstances which might affect the validity of guarantee or bond.

1.04 FORM OF SUBMITTALS

- A. Prepare in duplicate packets.
- B. Format:
 - 1. Size 8 1/2-inch x 11-inch sheets punched for 3-ring binder. Fold larger sheets to fit into binders.
 - 2. Identify each packet on the cover with typed or printed title, "GUARANTEES AND BONDS," and the following:
 - a. Title of Project.
 - b. Name of Contractor.
- A. Binders: Commercial quality, 3-ring, with durable and cleanable plastic covers. Label on front and spine.
- B. Digital: Create PDF® formatted documents. Save all guarantees, warranties, bonds service and maintenance contracts documents in clearly labeled files on two hard drives to be submitted to University.

1.05 TIME OF SUBMITTALS

- A. Within 10 days after date of Substantial Completion, prior to Request for Final Application for Payment, submit to University's Representative.

- B. For Work activities, where Final Completion is delayed materially beyond the date of Substantial Completion, provide updated submittal within 10 days after Final Completion, listing the date of Final Completion as the start of the Guarantee to Repair Period.

1.06 SUBMITTALS REQUIRED

- A. Submit guarantees, bonds, and service and maintenance contracts specified in individual Sections. All warranties, manuals, and as-built submittals to be provided to the University XX days of construction completion.

1.07 FORM OF GUARANTEE

Submit the following written Guarantee, typed on the Subcontractor's letterhead, when required by a Specification Section:

Date: _____ Project No.: _____

Project Name: _____

Project Location: _____

GUARANTEE FOR _____ (the "Contract"), between
the ("University") and _____ the ("Contractor")

_____ hereby guarantees to the University that the portion
(Name of Contractor) or (Subcontractor)

of the work described as follows: _____, which
it has provided for the above referenced Project, is of good quality; free from defects; free from any
liens, claims, and security interests; and has been completed in accordance with specification
SECTION and the other requirements of the Contract.

The undersigned further agrees that, if at any time within _____ months after the date of
the guarantee the undersigned receives notice from the University that the aforesaid portion of the
Work is unsatisfactory, faulty, deficient, incomplete, or not in conformance with the requirements of
the Contract, the undersigned will, within ten (10) calendar days after receipt of such notice,
correct, repair, or replace such portion of the Work, together with any other parts of the Work and
any other property which is damaged or destroyed as a result of such defective portion of the Work
or the correction, repair, or replacement thereof; and that it shall diligently and continuously
prosecute such correction, repair, or replacement to completion.

In the event the undersigned fails to commence such correction, repair, or replacement within ten
(10) calendar days after such notice, or to diligently and continuously prosecute the same to
completion, the undersigned, collectively and separately, do hereby authorize the University to
undertake such correction, repair, or replacement at the expense of the undersigned; and
Contractor will pay to the University promptly upon demand all costs and expenses incurred by the
University in connection therewith.

1. SUBCONTRACTOR

Signed: _____ Title: _____

Typed Name: _____

Name of Firm: _____

Contractor License Classification and License No.: _____

Address: _____

Phone Number: _____

SECTION 01 74 19 00 - CONSTRUCTION WASTE MANAGEMENT AND DISPOSAL

1.1 GENERAL

A. Summary

1. This Section includes administrative and procedural requirements for the following:
 - a. Salvaging nonhazardous demolition and construction waste.
Note: All salvageable materials remain the property of the Owner and shall be turned over as directed when specified in the Job Order.
 - b. Recycling nonhazardous demolition and construction waste.
 - c. Disposing of nonhazardous demolition and construction waste.

B. Definitions

1. Construction Waste: Building and site improvement materials and other solid waste resulting from construction, remodeling, renovation, or repair operations. Construction waste includes packaging.
2. Demolition Waste: Building and site improvement materials resulting from demolition or selective demolition operations.
3. Disposal: Removal off-site of demolition and construction waste and subsequent sale, recycling, reuse, or deposit in landfill or incinerator acceptable to authorities having jurisdiction.
4. Recycle: Recovery of demolition or construction waste for subsequent processing in preparation for reuse.
5. Salvage: Recovery of demolition or construction waste and subsequent sale or reuse in another facility.
6. Salvage and Reuse: Recovery of demolition or construction waste and subsequent incorporation into the Work.

C. Performance Goals **OR** Requirements, **as directed**

1. General: Develop waste management plan that results in end-of-Project rates for salvage/recycling of 50 **OR** 75, **as directed**, percent by weight of total waste generated by the Work.
2. Salvage/Recycle Goals **OR** Requirements, **as directed**: Owner's goal is to salvage and recycle as much nonhazardous demolition and construction waste as possible including the following materials:
OR
Salvage/Recycle Goals **OR** Requirements, **as directed**: Owner's goal is to salvage and recycle as much nonhazardous demolition and construction waste as possible. Owner has established minimum goals for the following materials:
 - a. Demolition Waste:
 - 1) Asphaltic concrete paving.
 - 2) Concrete.
 - 3) Concrete reinforcing steel.
 - 4) Brick.
 - 5) Concrete masonry units.
 - 6) Wood studs.
 - 7) Wood joists.
 - 8) Plywood and oriented strand board.
 - 9) Wood paneling.
 - 10) Wood trim.
 - 11) Structural and miscellaneous steel.
 - 12) Rough hardware.
 - 13) Roofing.
 - 14) Insulation.
 - 15) Doors and frames.

01 - General Requirements

- 16) Door hardware.
 - 17) Windows.
 - 18) Glazing.
 - 19) Metal studs.
 - 20) Gypsum board.
 - 21) Acoustical tile and panels.
 - 22) Carpet.
 - 23) Carpet pad.
 - 24) Demountable partitions.
 - 25) Equipment.
 - 26) Cabinets.
 - 27) Plumbing fixtures.
 - 28) Piping.
 - 29) Supports and hangers.
 - 30) Valves.
 - 31) Sprinklers.
 - 32) Mechanical equipment.
 - 33) Refrigerants.
 - 34) Electrical conduit.
 - 35) Copper wiring.
 - 36) Lighting fixtures.
 - 37) Lamps.
 - 38) Ballasts.
 - 39) Electrical devices.
 - 40) Switchgear and panelboards.
 - 41) Transformers.
 - b. Construction Waste:
 - 1) Site-clearing waste.
 - 2) Masonry and CMU.
 - 3) Lumber.
 - 4) Wood sheet materials.
 - 5) Wood trim.
 - 6) Metals.
 - 7) Roofing.
 - 8) Insulation.
 - 9) Carpet and pad.
 - 10) Gypsum board.
 - 11) Piping.
 - 12) Electrical conduit.
 - 13) Packaging: Regardless of salvage/recycle goal indicated above, salvage or recycle 100 percent of the following uncontaminated packaging materials:
 - a) Paper.
 - b) Cardboard.
 - c) Boxes.
 - d) Plastic sheet and film.
 - e) Polystyrene packaging.
 - f) Wood crates.
 - g) Plastic pails.
- D. Submittals
1. Waste Management Plan: Submit 3 copies of plan within 7 **OR** 30, **as directed**, days of date established for commencement of the Work **OR** the Notice to Proceed **OR** the Notice of Award, **as directed**.

2. Waste Reduction Progress Reports: Concurrent with each Application for Payment, submit three copies of report. Include separate reports for demolition and construction waste, **as directed**. Include the following information:
 - a. Material category.
 - b. Generation point of waste.
 - c. Total quantity of waste in **tons (tonnes)**.
 - d. Quantity of waste salvaged, both estimated and actual in **tons (tonnes)**.
 - e. Quantity of waste recycled, both estimated and actual in **tons (tonnes)**.
 - f. Total quantity of waste recovered (salvaged plus recycled) in **tons (tonnes)**.
 - g. Total quantity of waste recovered (salvaged plus recycled) as a percentage of total waste.
 3. Waste Reduction Calculations: Before request for Final Completion, submit three copies of calculated end-of-Project rates for salvage, recycling, and disposal as a percentage of total waste generated by the Work.
 4. Recycling and Processing Facility Records: Indicate receipt and acceptance of recyclable waste by recycling and processing facilities licensed to accept them. Include manifests, weight tickets, receipts, and invoices.
 5. Landfill and Incinerator Disposal Records: Indicate receipt and acceptance of waste by landfills and incinerator facilities licensed to accept them. Include manifests, weight tickets, receipts, and invoices.
 6. LEED Submittal: LEED letter template for Credit MR 2.1 and 2.2, **as directed**, signed by Contractor, tabulating total waste material, quantities diverted and means by which it is diverted, and statement that requirements for the credit have been met.
 7. Qualification Data: For Waste Management Coordinator and refrigerant recovery technician.
 8. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.
- E. Quality Assurance
1. Waste Management Coordinator Qualifications: LEED Accredited Professional by U.S. Green Building Council. Waste management coordinator may also serve as LEED coordinator.
 2. Refrigerant Recovery Technician Qualifications: Certified by EPA-approved certification program.
 3. Regulatory Requirements: Comply with hauling and disposal regulations of authorities having jurisdiction.
 4. Waste Management Conference: Conduct conference at Project site. Review methods and procedures related to waste management including, but not limited to, the following:
 - a. Review and discuss waste management plan including responsibilities of Waste Management Coordinator.
 - b. Review requirements for documenting quantities of each type of waste and its disposition.
 - c. Review and finalize procedures for materials separation and verify availability of containers and bins needed to avoid delays.
 - d. Review procedures for periodic waste collection and transportation to recycling and disposal facilities.
 - e. Review waste management requirements for each trade.
- F. Waste Management Plan
1. General: Develop plan consisting of waste identification, waste reduction work plan, and cost/revenue analysis. Include separate sections in plan for demolition and construction waste if Project requires selective demolition or building demolition. Indicate quantities by weight or volume, but use same units of measure throughout waste management plan.
 2. Waste Identification: Indicate anticipated types and quantities of demolition, site-clearing, and construction waste generated by the Work. Include estimated quantities and assumptions for estimates.
 3. Waste Reduction Work Plan: List each type of waste and whether it will be salvaged, recycled, or disposed of in landfill or incinerator. Include points of waste generation, total quantity of each type of waste, quantity for each means of recovery, and handling and transportation procedures.

- a. Salvaged Materials for Reuse: For materials that will be salvaged and reused in this Project, describe methods for preparing salvaged materials before incorporation into the Work.
 - b. Recycled Materials: Include list of local receivers and processors and type of recycled materials each will accept. Include names, addresses, and telephone numbers.
 - c. Disposed Materials: Indicate how and where materials will be disposed of. Include name, address, and telephone number of each landfill and incinerator facility.
 - d. Handling and Transportation Procedures: Include method that will be used for separating recyclable waste including sizes of containers, container labeling, and designated location on Project site where materials separation will be located.
4. Cost/Revenue Analysis: Indicate total cost of waste disposal as if there was no waste management plan and net additional cost or net savings resulting from implementing waste management plan. Include the following:
- a. Total quantity of waste.
 - b. Estimated cost of disposal (cost per unit). Include hauling and tipping fees and cost of collection containers for each type of waste.
 - c. Total cost of disposal (with no waste management).
 - d. Revenue from salvaged materials.
 - e. Revenue from recycled materials.
 - f. Savings in hauling and tipping fees by donating materials.
 - g. Savings in hauling and tipping fees that are avoided.
 - h. Handling and transportation costs. Include cost of collection containers for each type of waste.
 - i. Net additional cost or net savings from waste management plan.

1.2 PRODUCTS (Not Used)

1.3 EXECUTION

A. Plan Implementation

1. General: Implement waste management plan as approved by the Owner. Provide handling, containers, storage, signage, transportation, and other items as required to implement waste management plan during the entire duration of the Contract.
 - a. Comply with Division 01 Section "Temporary Facilities And Controls" for operation, termination, and removal requirements.
2. Waste Management Coordinator: Engage a waste management coordinator to be responsible for implementing, monitoring, and reporting status of waste management work plan. Coordinator shall be present at Project site full time for duration of Project.
3. Training: Train workers, subcontractors, and suppliers on proper waste management procedures, as appropriate for the Work occurring at Project site.
 - a. Distribute waste management plan to everyone concerned within three days of submittal return.
 - b. Distribute waste management plan to entities when they first begin work on-site. Review plan procedures and locations established for salvage, recycling, and disposal.
4. Site Access and Temporary Controls: Conduct waste management operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.
 - a. Designate and label specific areas on Project site necessary for separating materials that are to be salvaged, recycled, reused, donated, and sold.
 - b. Comply with Division 01 Section "Temporary Facilities And Controls" for controlling dust and dirt, environmental protection, and noise control.

B. Salvaging Demolition Waste

1. Salvaged Items for Reuse in the Work:
 - a. Clean salvaged items.
 - b. Pack or crate items after cleaning. Identify contents of containers.
 - c. Store items in a secure area until installation.
 - d. Protect items from damage during transport and storage.
 - e. Install salvaged items to comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make items functional for use indicated.
 2. Salvaged Items for Sale and Donation: Not permitted.
 3. Salvaged Items for Owner's Use:
 - a. Clean salvaged items.
 - b. Pack or crate items after cleaning. Identify contents of containers.
 - c. Store items in a secure area until delivery to Owner.
 - d. Transport items to Owner's storage area on-site **OR** off-site **OR** designated by Owner, **as directed**.
 - e. Protect items from damage during transport and storage.
 4. Doors and Hardware: Brace open end of door frames. Except for removing door closers, leave door hardware attached to doors.
- C. Recycling Demolition And Construction Waste, General
1. General: Recycle paper and beverage containers used by on-site workers.
 2. Recycling Receivers and Processors: Refer to the Owner for available recycling receivers and processors.
 3. Recycling Incentives: Revenues, savings, rebates, tax credits, and other incentives received for recycling waste materials shall accrue to Owner **OR** accrue to Contractor **OR** be shared equally by Owner and Contractor, **as directed**.
 4. Procedures: Separate recyclable waste from other waste materials, trash, and debris. Separate recyclable waste by type at Project site to the maximum extent practical.
 - a. Provide appropriately marked containers or bins for controlling recyclable waste until they are removed from Project site. Include list of acceptable and unacceptable materials at each container and bin.
 - 1) Inspect containers and bins for contamination and remove contaminated materials if found.
 - b. Stockpile processed materials on-site without intermixing with other materials. Place, grade, and shape stockpiles to drain surface water. Cover to prevent windblown dust.
 - c. Stockpile materials away from construction area. Do not store within drip line of remaining trees.
 - d. Store components off the ground and protect from the weather.
 - e. Remove recyclable waste off Owner's property and transport to recycling receiver or processor.
- D. Recycling Demolition Waste
1. Asphaltic Concrete Paving: Grind asphalt to maximum **1-1/2-inch (38-mm) OR 4-inch (100-mm), as directed**, size.
 - a. Crush asphaltic concrete paving and screen to comply with requirements in Division 31 Section "Earth Moving" for use as general fill.
 2. Asphaltic Concrete Paving: Break up and transport paving to asphalt-recycling facility.
 3. Concrete: Remove reinforcement and other metals from concrete and sort with other metals.
 - a. Pulverize concrete to maximum **1-1/2-inch (38-mm) OR 4-inch (100-mm), as directed**, size.
 - b. Crush concrete and screen to comply with requirements in Division 31 Section "Earth Moving" for use as satisfactory soil for fill or subbase.
 4. Masonry: Remove metal reinforcement, anchors, and ties from masonry and sort with other metals.
 - a. Pulverize masonry to maximum **3/4-inch (19-mm) OR 1-inch (25-mm) OR 1-1/2-inch (38-mm) OR 4-inch (100-mm), as directed**, size.

01 - General Requirements

- 1) Crush masonry and screen to comply with requirements in Division 31 Section "Earth Moving" for use as general fill **OR** satisfactory soil for fill or subbase, **as directed**.
 - 2) Crush masonry and screen to comply with requirements in Division 32 Section "Plants" for use as mineral mulch.
 - b. Clean and stack undamaged, whole masonry units on wood pallets.
 5. Wood Materials: Sort and stack members according to size, type, and length. Separate lumber, engineered wood products, panel products, and treated wood materials.
 6. Metals: Separate metals by type.
 - a. Structural Steel: Stack members according to size, type of member, and length.
 - b. Remove and dispose of bolts, nuts, washers, and other rough hardware.
 7. Asphalt Shingle Roofing: Separate organic and glass-fiber asphalt shingles and felts. Remove and dispose of nails, staples, and accessories.
 8. Gypsum Board: Stack large clean pieces on wood pallets and store in a dry location. Remove edge trim and sort with other metals. Remove and dispose of fasteners.
 9. Acoustical Ceiling Panels and Tile: Stack large clean pieces on wood pallets and store in a dry location.
 - a. Separate suspension system, trim, and other metals from panels and tile and sort with other metals.
 10. Carpet and Pad: Roll large pieces tightly after removing debris, trash, adhesive, and tack strips.
 - a. Store clean, dry carpet and pad in a closed container or trailer provided by Carpet Reclamation Agency or carpet recycler.
 11. Equipment: Drain tanks, piping, and fixtures. Seal openings with caps or plugs. Protect equipment from exposure to weather.
 12. Plumbing Fixtures: Separate by type and size.
 13. Piping: Reduce piping to straight lengths and store by type and size. Separate supports, hangers, valves, sprinklers, and other components by type and size.
 14. Lighting Fixtures: Separate lamps by type and protect from breakage.
 15. Electrical Devices: Separate switches, receptacles, switchgear, transformers, meters, panelboards, circuit breakers, and other devices by type.
 16. Conduit: Reduce conduit to straight lengths and store by type and size.
- E. Recycling Construction Waste
1. Packaging:
 - a. Cardboard and Boxes: Break down packaging into flat sheets. Bundle and store in a dry location.
 - b. Polystyrene Packaging: Separate and bag materials.
 - c. Pallets: As much as possible, require deliveries using pallets to remove pallets from Project site. For pallets that remain on-site, break down pallets into component wood pieces and comply with requirements for recycling wood.
 - d. Crates: Break down crates into component wood pieces and comply with requirements for recycling wood.
 2. Site-Clearing Wastes: Chip brush, branches, and trees on-site **OR** at landfill facility, **as directed**.
 - a. Comply with requirements in Division 32 Section "Plants" for use of chipped organic waste as organic mulch.
 3. Wood Materials:
 - a. Clean Cut-Offs of Lumber: Grind or chip into small pieces.
 - b. Clean Sawdust: Bag sawdust that does not contain painted or treated wood.
 - 1) Comply with requirements in Division 32 Section "Plants" for use of clean sawdust as organic mulch.
 4. Gypsum Board: Stack large clean pieces on wood pallets and store in a dry location.
 - a. Clean Gypsum Board: Grind scraps of clean gypsum board using small mobile chipper or hammer mill. Screen out paper after grinding.
 - 1) Comply with requirements in Division 32 Section "Plants" for use of clean ground gypsum board as inorganic soil amendment.

F. Disposal Of Waste

1. General: Except for items or materials to be salvaged, recycled, or otherwise reused, remove waste materials from Project site and legally dispose of them in a landfill or incinerator acceptable to authorities having jurisdiction.
 - a. Except as otherwise specified, do not allow waste materials that are to be disposed of accumulate on-site.
 - b. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
2. Burning: Do not burn waste materials.
OR
Burning: Burning of waste materials is permitted only at designated areas on Owner's property, provided required permits are obtained. Provide full-time monitoring for burning materials until fires are extinguished.
3. Disposal: Transport waste materials and dispose of at designated spoil areas on Owner's property.
OR
Disposal: Transport waste materials off Owner's property and legally dispose of them.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 32 13 00 - SUBSURFACE DRILLING AND SAMPLING

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing of labor and equipment for drilling, sampling and testing for subsurface investigation of soils.

B. System Description: The purpose of the work specified herein is to determine the type, nature, and characteristics of subsurface materials and the extent and conditions of the various materials as they exist to the depths and at the locations specified. This is to be accomplished by means of auger borings, drive sample borings, undisturbed sample borings, core drilling, pressure testing, or test pits.

1. Auger Borings and Sampling: An auger boring is any boring made in unconsolidated soils with a conventional manually or power-driven earth auger for the purpose of obtaining samples of subsurface materials. Auger boring and sampling shall be performed in accordance with ASTM D 1452.
2. Drive Sample Borings and Sampling: A drive sample boring is a boring made through unconsolidated or partly consolidated sediments or decomposed rock by means of a mechanically driven sampler. The purpose of these borings is to obtain knowledge of the composition, the thickness, the depth, the sequence, the structure, and the pertinent physical properties of foundation or borrow materials. Drive sample boring and sampling shall be performed in accordance with ASTM D 1587. Standard Penetration Tests (SPT) shall be performed in accordance with ASTM D 1586.
3. Undisturbed Sample Borings and Sampling: An undisturbed sample boring is a boring made to obtain soil samples which, when tested, will show properties as close to the in situ (in place) properties as any sample which can be obtained. All undisturbed sampling shall be accomplished in accordance with ASTM D 1587.
4. Core Drilling: Drilling of cores shall be performed as per ASTM D 2113. The method used shall provide equally good recovery of cores from both hard and soft rocks.
5. Pressure Testing (Hydraulic): Hydraulic pressure testing is the process of forcing water under pressure into subsurface rock formations through pre-drilled holes for the purpose of determining the subsurface leakage conditions and possible grouting requirements.
6. Test Pit Excavation and Sampling: A test pit is any excavation in soil, hardpan, decomposed rock, or other unconsolidated or partially consolidated overburden materials which has an open cross-sectional area large enough to permit efficient excavation and shoring/lining, engineering and geological inspection and photographing of the subsurface soils and manual undisturbed sampling from within the test pit. All test pits shall be excavated, dewatered (if necessary), shored/lined and protected from surface water drainage in accordance with all applicable Federal, State, local, and OSHA safety regulations.
7. Bearing Capacity: ASTM D 1149.
8. Soils Classification: ASTM D 2487, ASTM D 2488, MIL-STD 619.

C. Submittals

1. Permits, Certifications, and Licenses: Comply with all Federal, State and local laws, regulations and ordinances relating to the performance of this work. The Contractor shall, at its own expense, procure all required permits, certifications and licenses required of him by Federal, State, and local law for the execution of this work. Furnish copies of all such documents to the Owner prior to starting work.
2. Drilling, Sampling, and Testing Plan: Prior to starting work, submit a plan for drilling, sampling, testing, and safety. The plan shall include, but not be limited to, the proposed method of drilling and sampling including a description of the equipment and sampling tools that will be used, a listing of any subcontractors to include a description of how the subcontractors will be used and a description of all methods and procedures that will be utilized to ensure a safe operation and to protect the environment. This submittal shall also include a statement of the prior experience, in

the type of work described in these specifications, of the person or persons designated to perform the work specified herein. No work shall be performed until this plan has been approved and no deviation from the approved plan will be permitted without prior approval by the Owner.

- 3. Drilling Log: Submit complete, legible copies of drilling log and records to the Owner within 5 days after a hole or test pit is completed.

D. Care And Delivery Of Samples

- 1. General: The Contractor shall be solely responsible for preserving all samples in good condition. Keep samples from freezing and from undue exposure to the weather, and shall keep all descriptive labels and designations on sample jars, tubes, and boxes clean and legible until final delivery. Except as otherwise specified, deliver samples safely to test facility, **as directed**. Deliver samples within the time limits specified for each type of investigation or in accordance with schedules prepared by the Owner.
- 2. Undisturbed Samples: Take every precaution to avoid damage to samples as a result of careless handling and undue delay in shipping. Ship samples in containers approved by the Owner, of sufficient durability to protect the samples from any damage during shipment. Pack sample tubes in vermiculite or other equal material approved by the Owner to protect the samples against vibration. Avoid exposing sealed and crated samples to precipitation, direct sunlight, freezing and temperatures in excess of 100 degrees F (38 degrees C). Samples permitted to freeze, even partially, shall be replaced by the Contractor at its expense. In general, no undisturbed samples shall remain on the site of sampling for more than one week before shipment. Store and ship samples with the tube in a horizontal **OR** vertical, **as directed**, position in order to prevent consolidation and segregation or change of water content.

E. Project/Site Conditions

- 1. Environmental Requirements
 - a. In order to prevent and to provide for abatement and control of any environmental pollution arising from Contractor activities in the performance of this contract, the Contractor and its subcontractors shall comply with all applicable Federal, State, and local laws, regulations, and ordinances concerning environmental pollution control and abatement.
 - 1) The Contractor shall be responsible for keeping informed of all updates and changes in all applicable laws, regulations, and ordinances.
 - 2) The Contractor shall not pollute lakes, ditches, rivers, springs, canals, waterways, groundwaters, or reservoirs with drill fluids, fuels, oils, bitumens, calcium chloride, insecticides, herbicides, or other materials that may be harmful to the environment or a detriment to outdoor recreation.
- 2. Field Measurements: The approximate locations of drill holes or test pits shall be as directed. The actual locations will be established in the field by the Owner prior to the start of work. The elevations of the established locations will also be provided by the Owner prior to the start of work. The Contractor will provide access to the locations as it deems necessary for the prosecution of the work. Since no separate payment will be made for access construction, all costs associated with this shall be included in the cost of drilling or excavating.

F. Sequencing And Scheduling

- 1. Schedule of Drilling, Sampling and Testing: The schedule of Drilling, Sampling, and Testing is listed in the following schedule:

SCHEDULE OF DRILLING, SAMPLING AND TESTING

HOLE NO. or PIT NO.	METHOD	DEPTH FT(M)	VERTICAL or INCLINED	SPECIAL INSTRUCTIONS
------------------------	--------	----------------	-------------------------	-------------------------

- 2. Order of Work: The order in which the work is to be accomplished will be determined in the field by the Owner.

1.2 PRODUCTS

- A. Containers: Furnish jars, tubes, and boxes that meet the following requirements. All such containers will become the property of the Owner and the cost thereof shall be included in the contract price for the applicable item for which payment is provided.
1. Sample Jars: Sample jars shall be **1 pint (0.5 L) OR 1 quart (1.0 L), as directed**, capacity, wide-mouth over **2-1/4 inches (57 mm)** in diameter, glass **OR** plastic, **as directed**, jars with moisture-tight screw tops.
 2. Shipping Boxes: Boxes for shipping sample jars shall be corrugated cardboard **OR** wooden, **as directed**, boxes that have the capacity to hold no more than 12 sample jars and the strength to contain and protect the jars and their contents under ordinary handling and environmental conditions.
 3. Tubes and Crates: Undisturbed samples shall be shipped in thin walled Shelby tubes packed in crates.
 4. Core Boxes: Longitudinally partitioned, hinged top, wooden core boxes constructed of plywood and dressed lumber or other approved materials shall be used for all rock cores. As many core boxes as may be required shall be used to box all core. Core boxes shall be completely equipped with all necessary partitions, hinges, and a hasp for holding down the cover. In addition, the Contractor shall provide wood spacers made of surfaced lumber (not plywood) and having dimensions that are **1/8 inch (3 mm)** less than the inside dimensions of the individual core box troughs and no less than **3/4 inch (19 mm)** thick for blocking the core in the boxes and for providing a marking space to identify core runs and pull depths/elevations. The quantities of these blocks that are required are: ten blocks per core box for **3-inch (75-mm)** or smaller core, five blocks per core box for **4-inch (100-mm)** and PQ core, and three blocks per core box for **6-inch (150-mm)** core. The box should have the following capacities:

6-inch (150-mm) core	single row of core
4-inch (100-mm) or PQ core	2 rows of core
3-inch (75-mm) or smaller core	3 or 4 rows of core

The maximum length of a core box shall be **4 feet (1.2 m)** for **3-inch (75 mm)** or smaller core and shall be dimensioned so that a box will hold **12 to 16 feet (3.6 to 4.9 m)** of core. The maximum length of a core box for core that is larger than **3 inches (75 mm)** shall be **5 feet (1.5 m)**.
- B. Labels
1. Sample Jar Labels: A printed or type-written, fade resistant and waterproof label shall be affixed to the outside of each jar and shall contain the following information:

PROJECT _____	LOCATION _____
(Such as Table Rock Dam)	(Such as Borrow Area B)
HOLE NO. _____	STATION _____
JAR NO. _____ of _____ JARS	
TOP ELEV. OF HOLE _____	DEPTH OF SAMPLE _____
DESCRIPTION OF MATERIAL _____	
(Such as moist, silty, medium sand)	
 2. Shipping Box Labels: Each box of jar samples shall be identified with weatherproof and wear-proof labels indicating the following:

PROJECT: [_____]
LOCATION: [_____]
JAR SAMPLES FROM HOLE OR HOLES: [_____]
 3. Core Box Labels: Core boxes shall be identified with stenciled labels. The information on this label shall contain the following:

PROJECT: [_____]
HOLE NO. [_____]
BOX NO. [_____]
TOTAL NUMBER OF BOXES FOR THE HOLE: [_____]

1.3 EXECUTION

02 - Existing Conditions

A. Mobilization and Demobilization

1. Mobilization: Mobilization shall consist of the delivery to the site of all plant, equipment, materials and supplies to be furnished by the Contractor, the complete assembly in satisfactory working order of all such plant and equipment at the jobsite and the satisfactory storage at the site of all such materials and supplies.
2. Demobilization: Demobilization shall consist of the removal from the site of all plant, equipment, materials and supplies after completion of the work and also includes, at the direction of the Owner, the cleanup and removal of all scrap, waste backfill material, waste drilling fluid, soil contaminated with engine/hydraulic oil, backfilling all sumps or excavations resulting from the operations and, in general, returning the site as close to its original condition as possible.

B. Equipment and Supplies

1. Auger Boring and Sampling: The equipment to be furnished by the Contractor for making auger borings shall include, but not be limited to, standard continuous flight augers and/or standard cup-type earth augers, similar or equal to the Iwan Auger and not less than **4 inches (100 mm)** in diameter unless otherwise approved. The augers shall be completely equipped with all the accessories necessary for boring and sampling of overburden materials to the depths and diameters specified or shown on the drawings.
2. Drive Sample Boring and Sampling: Equipment to be furnished by the Contractor for making drive sample borings shall include, but not be limited to, standard **2-inch (50 mm)** split barrel **OR** solid barrel, **as directed**, drive samplers and power-driven drilling machinery of a type or types approved by the Owner, complete with a drive-hammer of the weight as required to meet project requirements, and all other accessories for taking samples of all types of soils or decomposed rock at the locations and to the depths indicated in the schedule in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING. The drive shoe for the split barrel samplers shall be of hardened steel and shall be replaced or repaired when it becomes dented or distorted. Supplies shall include, but not be limited to, all casing, drill stem, drill bits, drill fluid and additives, pumps, and power necessary to accomplish the required boring and sampling.
3. Undisturbed Sample Boring and Sampling: Equipment to be furnished by the Contractor for making undisturbed sample borings shall include, but not be limited to, power-driven drilling machinery of an approved type or types complete with the special devices and accessories enumerated and described hereinafter. Drilling machinery shall be of the hydraulic feed type. Supplies shall include, but not be limited to, all samplers, casing, drill stem, drill bits, drill fluid and additives, pumps, and power necessary to accomplish the required boring and sampling. Drill casing, if used, shall be of such minimum inside diameter as to allow use of the selected sampler.
 - a. Sands and Cohesive Soils: The sampling device used to sample fine to medium grain sands and cohesive soils shall be a fixed or stationary piston type that uses a **3-inch (75-mm)** **OR 5-inch (125-mm)**, **as directed**, diameter thin wall Shelby tube. Subject to the approval of the Owner, floating or free piston and non-piston type samplers may be used provided adequate means, such as check valve or vacuum system, are provided to prevent loss of samples.
 - b. Stiff and Dense Soils: The sampling device for obtaining samples of stiff and dense soils shall be similar or equal to a Denison double tube, swivel head core barrel, or a Pitcher sampler and must be approved by the Owner prior to use.
4. Core Drilling - Size BX and NX Core: Equipment to be furnished by the Contractor for core drilling shall include core-drilling machinery of a type or types approved by the Owner complete with all the accessories needed to take continuous rock cores of a diameter consistent with bit size to the depths specified. The Contractor shall use, as a minimum, a standard ball-bearing, swivel-head, double-tube core barrel, or equivalent. The capacity of the core barrel shall not exceed **10.5 feet (3.2 m)** of core. Supplies for core drilling to be furnished by the Contractor shall include, but not be limited to, all casing, drill rods, core barrels, coring bits, piping, pumps, water, tools, and power required for drilling and all boxes and containers required for core samples. Selection of the type of bit shall be at the Contractor's discretion provided that the selected bit produces high quality rock core. (see paragraph SUPPLEMENTAL BORINGS or PITS). The

- Contractor's drilling equipment shall be capable of drilling inclined as well as vertical core holes as specified.
5. Pressure Testing (Hydraulic): Pressure testing equipment to be furnished by the Contractor shall include, but not be limited to, a water pump with a minimum capacity of **50 gallons per minute (3.15 liters per second)** that is capable of delivering a constant discharge pressure with double expander packers with rubber expansion elements set **5 feet (1.5 m) OR 10 feet (3 m), as directed**, apart with piping so arranged that water may be admitted either below the bottom packer element or between the two packer elements, a pressure relief valve, a pressure gage capable of measuring water pressures to the nearest **10 psi (1.45 kPa)** and water meter capable of measuring flows to the nearest **1.6 gallon(s) per minute (0.1 liter(s) per second)**. Supplies shall include, but not be limited to, all accessory valves, gages, surge tanks, stopcocks, plugs, expanders, potable water for testing, standby pumps, fuels, pipes, pressure hose, and tools necessary for maintaining uninterrupted tests for each boring to be tested. The pressure test equipment shall be configured so that the pressure gage is located at the top of the hole, a by-pass water line and valve are located between the pump and the gage, a flow meter is located between the by-pass and the pressure gage, and a valve is located in the line between the flow meter and the pressure gage. All equipment and supplies used for pressure testing shall be approved by the Owner prior to use.
 6. Test Pit Excavation and Sampling: Selection of the test pit excavation, shoring/lining and dewatering (if necessary) methods and equipment shall be at the Contractor's discretion but must be approved by the Owner. When the number of test pits to be excavated is large, and when adaptable mechanical trenching equipment is available, the Owner may require that such mechanical excavating equipment be used to expedite completion of the pits. Supplies which the Contractor shall furnish for obtaining undisturbed samples shall include, but not be limited to, split metal cylinders and/or metal or wooden boxes of acceptable sizes and types. Accessories to be supplied by the Contractor shall include, but not be limited to, a small sample trimming shovel or spade, hatchet, trimming knife, wax and facilities for melting and brushing same, trowels, labels, and boxes for shipping samples. The Contractor shall also furnish all materials required for shoring/lining to comply with all applicable safety regulations. The Owner may require the Contractor to salvage and re-use this shoring/lining material in successive test pits.
- C. Identifying Samples: Sample jars, shipping boxes, and labels shall comply with paragraphs SAMPLE JARS, SHIPPING BOXES, and LABELS, respectively. The Contractor shall take all precautions required to insure that the shipping boxes are not subjected to rough handling or damaging environmental conditions, and complies with paragraph CARE AND DELIVERY OF SAMPLES. A copy of the boring log for the portion of the boring that the samples came from shall be enclosed in the shipping box.
- D. Auger Boring and Sampling: Samples shall be labeled in accordance with paragraph IDENTIFYING SAMPLES. Samples shall be obtained for each change of overburden material and at maximum vertical intervals as directed by the Owner. In order to retain the natural moisture content of the material to the fullest extent possible, all samples shall be of sufficient volume to completely fill the sample jars and the samples shall be placed in the sample jars as soon as possible after they are taken from the hole. All sample jars shall be labeled. In general, no sample shall remain on the site of boring for more than 1 week after being taken from the boring and placed in a jar.
- E. Drive Sample Boring and Sampling: Samples shall be labeled in accordance with paragraph IDENTIFYING SAMPLES. Drive sample borings drilled through overburden materials shall be suitably cased to permit obtaining drive samples of the size or sizes specified or as directed. Samples shall be taken either continuously or at a change in materials in accordance with instructions contained in the SCHEDULE OF DRILLING, SAMPLING, AND TESTING or as otherwise directed by the Owner. To minimize the compacting effect of casing driving when casing is used to stabilize a boring, the bottom of the casing shall be kept as high above the soil sampling zone as conditions permit. If hollow stem auger is used as a casing and/or to advance the boring, a plug assembly must be used to keep soil from entering the inside of the auger. Above the water table, samples shall be obtained from a dry hole. Below the water table, water shall be maintained within the hole at or above the groundwater level.

02 - Existing Conditions

Where information on the natural water content of soils above the water table is not needed and when approved by the Owner, boreholes may be drilled without casing by using a suitable drilling fluid to prevent collapse of sidewalls. When a drilling fluid is used, soil sampling shall be done by such means that will prevent inclusion of drilling fluid in the samples. The samples shall be placed in sample jars as soon as possible after they are taken from the hole and, when possible, the volume of the sample shall be large enough to completely fill the sample jar in order that the natural moisture content of the material may be retained to the fullest extent possible. All samples shall be labeled. No sample shall remain at the site of boring for more than one week after being taken from the hole.

- F. Undisturbed Sample Boring And Sampling: In general, labeling of undisturbed samples shall conform to paragraph IDENTIFYING SAMPLES. Particular care shall be taken to indicate the top and bottom of each sample tube. Tubes and crates for undisturbed samples shall be labeled "DO NOT JAR OR VIBRATE" and "HANDLE, HAUL, AND SHIP IN A HORIZONTAL **OR** VERTICAL POSITION," **as directed**.
1. Procedure: The procedure for Undisturbed Sample Boring and Sampling shall be the same as outlined in paragraph DRIVE SAMPLE BORING AND SAMPLING, except that the sampling device shall be advanced downward by one continuous, smooth drive using the drill rig's hydraulic feed system. The hydraulic down pressure shall be read and recorded at **6 inch (150 mm)** intervals during each sample drive. The sampling device for stiff and dense soils shall be advanced by continuous rotation of the outer cutting barrel in conjunction with use of drill fluid circulation. Driving of any undisturbed sampling device by means such as a drop hammer will not be permitted.
 2. Sealing
 - a. Alternate 1: The soil sample obtained in a thin wall Shelby tube shall be retained in the tube and sealed on both ends with a mechanically expandable O-ring sealing disk of the appropriate size.
 - b. Alternate 2: The soil sample obtained in a thin wall Shelby tube shall be extruded from the tube in the field as soon as the tube is removed from the boring by a method approved by the Owner. The extruded soil sample shall immediately be wrapped in aluminum foil or thin plastic wrap and placed in the center of a metal bottomed, waxed cardboard or plastic tube that has a diameter of at least **1 inch (25 mm)** larger than the diameter of the soil sample, is at least **1-inch (25 mm)** longer than the length of the soil sample, and has at least **1/2-inch (13 mm)** of congealed 50/50 mixture of paraffin and microcrystalline wax in the bottom. The annular space between the soil sample and the tube shall be filled with a 50/50 mixture of paraffin and microcrystalline wax to a distance of at least **1/2-inch (13 mm)** above the top of the soil sample.
 - c. Alternate 3: Both ends of the soil sample tube/liner obtained with a Denison barrel, or its equivalent, shall be cleaned out to remove all drill fluid contaminated and/or disturbed soil or to a minimum distance of **2 inches (50 mm)** from the ends of the tube/liner. Any material removed that is not contaminated with drill fluid shall be placed in a sample jar and labeled in accordance with paragraph IDENTIFYING SAMPLES. The cleaned out ends of the sample liner tube shall then be sealed with a 50/50 mixture of paraffin and microcrystalline wax. A metal or wooden disk, having a diameter just slightly smaller than the inside diameter of the liner tube shall be inserted into the wax to a distance of **1/4-inch (6 mm)** from the end of the soil sample. The wax plugs shall be flush with the ends of the tube and a final seal consisting of a metal cap or tape shall be placed over the ends of the tube.
- G. Core Hole Overburden Drilling: Where samples of overburden materials are required in connection with core drilling, the soil overburden shall be drilled and sampled in accordance with the applicable provisions for the type of samples required. Where sampling of the overburden materials is not required, the Contractor may utilize any method and equipment for drilling and, if required, casing through the overburden that will not affect the quality of the core drilling from the rock surface downward in accordance with these specifications. The method chosen must be approved by the Owner prior to starting any overburden drilling.

- H. Core Drilling - Size BX and NX core.
1. Procedure: All holes shall be drilled vertically **OR** at the inclined angles listed in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING, **as directed**, to the bottom elevations or depths specified unless indicated in the schedule of borings or directed to be drilled otherwise. Off-setting of borings from the locations specified in the Plan of Borings or as shown on the drawings, will not be permitted without prior approval. Casing through the overburden may be required. This casing shall be sealed in the rock at the elevation where rock is encountered prior to commencement of rock coring. The Contractor shall operate its drills at such speeds and with such down pressures and shall control drill fluid pressures and quantities to insure maximum core quality and recovery in whatever kind of rock is encountered. Where soft or broken rock is encountered, the Contractor shall reduce the length of runs to **5 feet (1.5 m)** or less in order to reduce and/or keep core loss and core disturbance to the minimum. Failure to comply with the foregoing procedures shall constitute justification for the Owner to require redrilling, at the Contractor's expense, of any boring from which the core recovery is unsatisfactory. The Contractor shall exercise particular care in recording zones of water loss, cavities, rod jerks, rough drilling and other unusual and non-ordinary coring experiences that, supplementing the core record, will throw light on the nature and the extent of any fracturing or abnormalities.
 2. Arrangement of Core: Core boxes shall comply with paragraph CORE BOXES. All cores shall be arranged neatly in the partitioned boxes in the same sequence in which they occurred before removal from the hole. Facing the open box with the hinged cover above and the open box below, cores shall be arranged in descending sequence beginning at the left end of the trough nearest the hinges and continuing in the other troughs from left to right. The highest part of the core shall be placed in box 1, and the lower portions of the core shall be placed in the other boxes in consecutive order.
 3. Preservation of Core: Representative samples of core shall be wrapped in aluminum foil or thin plastic wrap or cheese cloth and then sealed by applying paraffin wax to the outside of the wrapping material prior to placing the core in the core box. This sealing process shall be accomplished as soon as possible after the core is removed from the core barrel. The minimum length of core that is preserved from each boring shall be no less than 2.5 times the core diameter. Spacer blocks shall be marked and placed in the core box to show where samples have been removed.
 4. Labeling, Marking and Packing Core: Stenciled labels for core boxes complying with paragraph CORE BOX LABELS shall be placed on the inside and outside of the top cover in addition to each end. In addition, the depths (or elevations) of each core run/pull shall be marked with a black waterproof pen on the spacer blocks that are placed between core pulls. When a box is full, the space between the core and the trough sides shall be filled with finely ground vermiculite or other packing material approved by the Owner.
 5. Disposition of Core: While on site, the Contractor shall protect the filled core boxes from direct sunlight, precipitation, and freezing by some form of the Owner approved shelter that allows ventilation to the boxes. Upon completion of core drilling and sampling operations, core boxes containing cores shall be stored in an area provided by the Owner near the site of drilling **OR** shipped or delivered to address provided by the Owner, **as directed**.
- I. Pressure Testing (Hydraulic): The Contractor shall pressure-test each hole commencing at the top of bedrock and progressing downward to the bottom of the hole or to such depths as determined by the Owner below which testing of the hole is not necessary. Where core data from the test holes indicate only isolated zones that are open or fractured, pressure testing may be limited by the Owner to these zones only. Water pressure employed for each lift shall be determined in the field by the Owner and shall not exceed of depth **one pound per square inch per foot (22.6 kPa per meter)** of depth to the upper expander. The pressure test will be divided into two phases; the first phase will be a flow test which shall then be followed by the second phase which is a duration test. In performing the first phase, water is pumped slowly at first, and the flow then gradually increased to the point where the predetermined maximum pressure is maintained, by adjusting the valve on the by-pass line. The allowable pressure shall be held for 1 minute before any readings are taken. The volume of flow into the test section shall be measured for a period of 5 minutes during which time the pressure shall not vary by more than **5 psi (34.5 kPa)**. After this 5-minute test, the second phase shall be started by closing the valve located

between the flow meter and the pressure gage. The drop in pressure is then read for a period of 5 minutes at 15 to 30-second intervals. In some situations, such as in a very tight formation, the Owner may eliminate phase one of the test. The Contractor may be required to make check tests at its own expense if the testing equipment or its assembly and arrangement are found to be faulty during or after the testing of any holes. The Contractor shall record all gage and meter readings made during a pressure test on a suitable form approved by the Owner.

J. Test Pit Excavation And Sampling

1. Excavation: The test pits shall be excavated in the order scheduled in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING, and shall be excavated to depths and dimensions indicated in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING. Before excavating pits, the Contractor shall thoroughly familiarize itself with work site and with all available subsurface data, particularly groundwater conditions. Regardless of the method of excavation employed, the pits shall be excavated, dewatered and shored/lined in conformance with all applicable safety regulations.
2. Sampling: Soil samples shall be obtained from each pit at the depths/elevations indicated in paragraph SCHEDULE OF DRILLING, SAMPLING, AND TESTING **OR** at depths determined by the Owner, **as directed**. In obtaining samples from test pits, the undisturbed in situ (in place) natural physical and structural characteristics of the sampled materials shall be preserved insofar as possible both while samples are being taken and during shipment to the point of testing. In cohesive and partially cohesive soils this may be accomplished by isolating the soil column or cube to be sampled by gently trenching around it and knife-trimming it to the required dimensions of the split cylinder or box. A thin coating of melted 50/50 mixture of paraffin and microcrystalline wax shall then be applied quickly but gently to the sample with a paint brush to seal it against loss of moisture. The metal or wooden sample container, with the top and bottom removed shall then be placed over the wax coated sample such that the sample is centered within the container and the top of the container sides are at least **1 inch (25 mm)** above the top of the sample. The spaces between the sample and the side walls of the container shall then be filled with melted wax. After this wax has congealed, the space between the top of the sample container sides and the top of the sample shall be filled with wax. After this wax has congealed, it shall be trimmed so that when the top of the sample container is installed there is no void between the container top and the wax. After the container top is installed, the soil column or cube shall then be cut off a few hundred **inches (millimeters)** below the container, the sample and container inverted and removed from the pit and the sample trimmed at the base so that the bottom of the sample is at least **1 inch (25 mm)** below the bottom of the container. This space shall be filled with wax and, after the wax has congealed, it shall be trimmed so that when the bottom of the container is installed, there shall be no void between the wax and the bottom of the container. Where overburden materials to be sampled are only partially cohesive, it is best not to expose the entire soil column before waxing. By exposing and waxing small sections at a time, the sample will be subjected to less disturbance. Where natural moisture content is an important factor, delay shall be avoided in taking the sample in order that the natural moisture content of the material may be retained to the fullest extent.
3. Disposition of Samples: Samples shall be packed in vermiculite or a packing material approved by the Owner and shipped in sturdy wooden boxes of strength and construction sufficient to guarantee against damage during shipment. Boxes should be no larger than is required for shipping two such samples. All sample boxes shall be marked FRAGILE-HANDLE WITH CARE and shall be identified by labels, similar to those as specified in paragraph IDENTIFYING SAMPLES, attached to the outside of each box. Extreme care shall be taken to indicate the top and bottom of each sample. The Contractor shall avoid exposing sealed and crated samples to precipitation and extremes of temperature. Undisturbed samples permitted to freeze, even partially, shall be replaced by the Contractor at its expense. The Contractor shall not hold these samples at the site of sampling for a period in excess of one week. Prior to shipment, each sealed and boxed sample shall be checked for correct labeling.

- K. Supplemental Borings or Pits: Borings or Pits that are abandoned or from which unsatisfactory samples or cores are obtained will be supplemented by other borings or pits adjacent to the original in order that satisfactory samples or the required information will be obtained. Actual locations of any supplemental borings or pits will be established by the Owner. Penetration to the depth where the original was abandoned or to the depths where unsatisfactory samples were obtained may be made by any method selected by the Contractor that in the opinion of the Owner will permit satisfactory completion and sampling below the elevation where the last satisfactory sample was obtained in the abandoned or satisfactory sampling in the reaches where satisfactory samples were not obtained in the original borings or pits. No payment will be made for supplemental borings or pits that are required to be drilled or excavated to replace borings or pits that were abandoned or from which satisfactory samples were not obtained because of mechanical failure of drilling and sampling equipment, negligence on the part of the Contractor, or other preventable cause for which the Contractor is responsible except that payment will be made for acceptable portions of these supplementary borings or pits below the depths or outside the reaches for which payment was made for the original borings or pits.
- L. Backfilling
1. Drill Holes: Unless otherwise noted in these specifications or directed by the Owner, all drill holes shall be backfilled and abandoned in accordance with all Federal, State, and local laws, regulations and ordinances. The Contractor shall preserve all holes in good condition until final measurement and until the records and samples have been accepted. As a minimum, all holes shall be grouted from the bottom of the hole to within **2 feet (600 mm)** of the ground. All grout shall be pumped through a tremie pipe that is inserted to the bottom of the boring to ensure that the grout fills the full extent of the hole. The remaining ungrouted portion of the hole shall be backfilled with local soil and tamped. All backfilling operations shall be performed in the presence of the Owner and, if required by regulation, Federal, State, and local officials. No separate payment will be made for backfilling drill holes. The cost of this work shall be included in the drilling costs.
 2. Test Pits: The Contractor shall backfill all test pits with local soil compacted to original densities as directed by the Owner. No separate payment will be made for backfilling test pits. The cost of this work shall be included in the test pit excavation costs.
- M. Records: The Contractor shall keep accurate driller's logs and records of all work accomplished under this contract and shall deliver complete, legible copies of these logs and records to the Owner upon completion of the work or at such other time or times as it may be directed. All such records shall be recorded during the actual performance of the work and shall be preserved in good condition and order by the Contractor until they are delivered and accepted. The Owner shall have the right to examine and review all such records at any time prior to their delivery to him and shall have the right to request changes to the record keeping procedure. The following information shall be included on the logs or in the records for each hole or test pit:
1. Hole or Test Pit number or designation and elevation of top of hole or test pit.
 2. Driller's name and Geologist's name.
 3. Make, size, and manufacturer's model designation of drilling, sampling, pressure testing, and test-pit excavating equipment.
 4. Type of drilling, sampling, and pressure testing operation by depth.
 5. Hole diameter.
 6. Dates and time by depths when test-pit excavation, drilling, sampling, and pressure testing operations were performed.
 7. Time required for drilling each run and pressure testing each interval tested.
 8. Drill action, rotation speed, hydraulic pressure, water pressure, tool drops, and any other unusual and non-ordinary experience which could indicate the subsurface conditions encountered.
 9. Depths at which samples or cores were recovered or attempts made to sample or core including top and bottom depth of each run and of each interval pressure tested.
 10. Classification or description by depths of the materials sampled, cored, or penetrated using the Unified Soil Classification System (ASTM D 2487) and including a description of moisture conditions, consistency and other appropriate descriptive information described in paragraph

SUPPLEMENTAL BORINGS or PITS of ASTM D 2488. This classification or description shall be made immediately after the samples or cores are retrieved.

11. Classification and description by depths of rock materials sampled or cored including rock type, composition, texture, presence and orientation of bedding, floiation, or fractures, presence of vugs or other interstices, and the RQD for each cored interval.
12. Indication of penetration resistance such as drive-hammer blows given in blows per foot for driving sample spoons and casing and the pressure in applied to push thin-wall or piston-type samplers.
13. **Weight (Force)** of drive hammer.
14. Percentage of sample or core recovered per run.
15. Depth at which groundwater is encountered initially and when stabilized.
16. Depths at which drill water is lost and regained and amounts.
17. Depths at which the color of the drill water return changes.
18. Type and weight of drill fluid.
19. Depth of bottom of hole.
20. Pressures employed in pressure testing.

TABLE 1 - COMMON CORE DIAMETERS
CORE DIAMETER

	CORE DIAMETER		HOLE DIAMETER	
	in.	(mm)	in.	(mm)
Conventional Core Barrels				
AWG	1.185	(30.1)	1.890	(48.0)
BWG	1.655	(42.0)	2.360	(60.0)
NWG	2.155	(54.7)	2.980	(75.7)
HWG	3.000	(76.2)	3.907	(99.2)
Wireline Core Barrels*				
A	1.064	(27.0)	1.890	(48.0)
B	1.432	(36.5)	2.360	(60.0)
N	1.875	(47.6)	2.980	(75.7)
H	2.450	(62.2)	3.716	(94.4)
	3.345	(85.0)	4.827	(122.6)
Large Diameter Series				
2-3/4" X 3-7/8"	2.690	(68.3)	3.875	(98.4)
4" X 5-1/2"	3.970	(100.8)	5.495	(139.6)
6" X 7-3/4"	5.970	(151.6)	7.750	(196.9)

*No Industry Standard for Wireline Sizes. Diameters shown for wireline core barrels are nominal and vary between manufacturers.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 41 13 13 - PORTLAND CEMENT CONCRETE REMOVAL

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for portland cement concrete removal. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Section Includes:

1. Provide all labor, materials and equipment required for the removal work and disposal of existing Portland Cement Concrete indicated on the drawings and specified, including but not limited to the following:
 - a. Saw cutting existing concrete pavements, sidewalks, driveways, curbs and gutters noted on drawings to be removed.
 - b. Saw cutting existing concrete sidewalks for new tree pit openings (refer to drawings for locations).
 - c. Saw cutting existing bituminous paving noted on drawings to be removed.
 - d. Removal and disposal of demolished concrete sidewalks, driveways, curbs and gutters, including concrete removed for new tree pit openings.
 - e. Removal and disposal of demolished bituminous paving.
 - f. All excavating, rough grading and compacting as required to establish subgrade for new sidewalks, and Subgrade and Sub-Base for driveways.
 - g. Providing, placing and grading sand fill under new sidewalks. Top of compacted subgrades shall allow for the placement of sidewalks plus thickness of sand fill.
 - h. Removal and disposal of excavated material.

C. Special Requirements:

1. Protection: Provide protection barricades, maintain all lights and signals and other measures as required by federal, state, and municipal laws, for the full period of demolition operations and remove same when directed. In removing work, perform all work required to protect and maintain adjacent property, streets, alleys, sidewalks, curbs, and other structures remaining in place.

1.2 PRODUCTS

A. Backfilling Material:

1. Sand: Natural sand, with the following gradation: 100% passing the 1 sieve-, 65-100% passing the No. 4 sieve; 40-90% passing the No. 10 sieve- 30-80% passing the No. 16 sieve- 10-50% passing the No. 50 sieve; 0-30% passing the No. 100 sieve, and 0-10% passing the No. 200 sieve.
2. Crushed Stone: Crushed stone having a #57 crusher run gradation.

1.3 EXECUTION

A. Demolition:

1. The contractor shall accept the site as it finds it and shall inform itself as to the character and types of work to be removed. The Owner assumes no responsibility for the condition of the existing construction to be removed or demolished.
2. No demolition shall be commenced until a program of operations has been coordinated with the Owner, except that preparatory work may be started if specifically approved by the Owner.

3. Operations shall be done in such manner as to avoid hazards to persons and property and interference with use of adjacent areas or interruption of free passage to and from such areas. Maintain Pedestrian access to all private entrances where construction of new sidewalks is in progress. Provide temporary walk ways or other means as required to maintain entry into the private properties, complying with all laws and ordinances and as approved by the Owner. Care shall be taken to prevent the spread of dust and flying particles.
4. Demolition and removal work shall be executed in a careful and orderly manner. Accumulation of rubbish will not be permitted.
5. After work is started, it shall be continued to completion at a rate that will allow the balance of the work to be completed within the time specified. If extra shifts are necessary beyond regular working hours, the work shall proceed with a minimum of nuisance to surrounding properties.
6. Contractor shall determine the nature and extent of demolition that will be necessary by comparing the drawings with the existing field conditions. It is expressly understood that this contract includes all work of a demolition nature that may be required or necessary for a full and complete execution of the work, whether particularly referred to herein or not.

B. Removal And Excavation:

1. When removing existing sidewalks, driveways, curbs and gutters provisions shall be made for satisfactory transition between replacements and the portion remaining in place. The contractor shall saw cut to a minimum depth of 1-1/2 inches with a concrete sawing machine to prevent the surface from spalling when the concrete is broken out. This work shall be done in such a manner that a straight joint will be secured.
2. It shall be the responsibility of the contractor to determine the thickness of the existing sidewalk to be removed. No additional compensation will be allowed because of variations from the assumed thickness or from the thickness shown on the plans.
3. After existing concrete sidewalks and driveways have been removed, excavate to depth required for sand fill.
4. The bottoms of all excavations shall be properly leveled off and all loose materials shall be removed from excavations. All wood, timber and organic materials, that are exposed at the bottom of all excavations, shall be removed and the area backfilled with sand and compacted.
5. Any excess or unauthorized excavation shall be backfilled with sand and compacted, at no additional cost to the Owner.
6. No backfill shall be placed in standing water, on frozen ground or on surfaces which have not been approved by the Commissioner.
7. Backfilling for all areas shall be approved material. Backfill shall be compacted to 95% maximum density in accordance with ASTM D 1557.
8. Contractor shall determine the nature and extent of excavation work that will be necessary by comparing the drawings with the existing areas to be excavated. It is expressly understood that this contract includes all work of an excavation nature that may be required or necessary for a complete execution of all excavation work, whether particularly referred to herein or not.

C. Disposal Of Materials:

1. All demolished and unsuitable materials, including excavated earth removed to establish required grade elevations shall be disposed of legally in such a manner that public or private property will not be damaged or endangered.

D. Clean-Up:

1. On completion of the demolition work, excavation work and before acceptance by the Owner, clean the areas affected, including areas outside the limits of the contractor's work area where permission to work has been granted. Remove surplus construction material or debris resulting from the demolition work and excavation work, and dispose of legally off the site.
2. Access routes to and from the site shall be kept clean of debris resulting from the work.

END OF SECTION 02 41 13 13

SECTION 02 41 13 13a - SELECTIVE DEMOLITION

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for selective demolition. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Demolition and removal of selected portions of building or structure.
 - b. Demolition and removal of selected site elements.
 - c. Salvage of existing items to be reused or recycled.

C. Definitions

1. Remove: Detach items from existing construction and legally dispose of them off-site, unless indicated to be removed and salvaged or removed and reinstalled.
2. Remove and Salvage: Detach items from existing construction and deliver them to the Owner ready for reuse, **as directed**.
3. Remove and Reinstall: Detach items from existing construction, prepare them for reuse, and reinstall them where indicated.
4. Existing to Remain: Existing items of construction that are not to be removed and that are not otherwise indicated to be removed, removed and salvaged, or removed and reinstalled.

D. Materials Ownership

1. Historic items, relics, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, antiques, and other items of interest or value to the Owner that may be encountered during selective demolition remain the Owner's property. Carefully remove and salvage each item or object in a manner to prevent damage and deliver promptly to the Owner.
 - a. Coordinate with the Owner's archaeologist **OR** historical adviser, **as directed**, who will establish special procedures for removal and salvage.

E. Submittals

1. Qualification Data: For demolition firm, professional engineer, refrigerant recovery technician, **as directed**.
2. Schedule of Selective Demolition Activities: Indicate the following:
 - a. Detailed sequence of selective demolition and removal work, with starting and ending dates for each activity. Ensure the Owner's building manager's and other tenants' on-site operations are uninterrupted.
 - b. Interruption of utility services. Indicate how long utility services will be interrupted.
 - c. Coordination for shutoff, capping, and continuation of utility services.
 - d. Use of elevator and stairs.
 - e. Locations of proposed dust- and noise-control temporary partitions and means of egress, including for other tenants affected by selective demolition operations.
 - f. Coordination of the Owner's continuing occupancy of portions of existing building and of the Owner's partial occupancy of completed Work.
 - g. Means of protection for items to remain and items in path of waste removal from building.
3. Inventory: After selective demolition is complete, submit a list of items that have been removed and salvaged.

02 - Existing Conditions

4. Predemolition Photographs or Videotapes: Show existing conditions of adjoining construction and site improvements, including finish surfaces, that might be misconstrued as damage caused by selective demolition operations. Submit before Work begins.
5. Landfill Records: Indicate receipt and acceptance of hazardous wastes by a landfill facility licensed to accept hazardous wastes.
 - a. Comply with submittal requirements in Division 01 Section "Construction Waste Management And Disposal".

F. Quality Assurance

1. Demolition Firm Qualifications: An experienced firm that has specialized in demolition work similar in material and extent to that indicated for this Project.
2. Refrigerant Recovery Technician Qualifications: Certified by an EPA-approved certification program.
3. LEED Requirements for Building Reuse:
 - a. Credit MR 1.1 and 1.2, **as directed**: Maintain existing building structure (including structural floor and roof decking) and envelope (exterior skin and framing, excluding window assemblies and nonstructural roofing material) not indicated to be demolished; do not demolish such existing construction beyond indicated limits.
 - b. Credit MR 1.3: Maintain existing interior nonstructural elements (interior walls, doors, floor coverings, and ceiling systems) not indicated to be demolished; do not demolish such existing construction beyond indicated limits.
 - c. Credit MR 1.2 and 1.3, **as directed**: Maintain existing nonshell, nonstructural components (walls, flooring, and ceilings) not indicated to be demolished; do not demolish such existing construction beyond indicated limits.
4. Regulatory Requirements: Comply with governing EPA notification regulations before beginning selective demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.
5. Standards: Comply with ANSI A10.6 and NFPA 241.
6. Predemolition Conference: Conduct conference at Project site. Review methods and procedures related to selective demolition including, but not limited to, the following:
 - a. Inspect and discuss condition of construction to be selectively demolished.
 - b. Review structural load limitations of existing structure.
 - c. Review and finalize selective demolition schedule and verify availability of materials, demolition personnel, equipment, and facilities needed to make progress and avoid delays.
 - d. Review requirements of work performed by other trades that rely on substrates exposed by selective demolition operations.
 - e. Review areas where existing construction is to remain and requires protection.

G. Project Conditions

1. the Owner will occupy portions of building immediately adjacent to selective demolition area. Conduct selective demolition so the Owner's operations will not be disrupted.
2. Conditions existing at time of inspection for bidding purpose will be maintained by the Owner as far as practical.
 - a. Before selective demolition, items will be removed as directed by the Owner.
3. Notify the Owner of discrepancies between existing conditions and Drawings before proceeding with selective demolition.
4. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.
 - a. Hazardous materials will be removed by the Owner before start of the Work **OR** have been removed by the Owner under a separate contract, **as directed**.
 - b. If materials suspected of containing hazardous materials are encountered, do not disturb; immediately notify the Owner. the Owner will remove hazardous materials under a separate contract.

OR

5. Hazardous Materials: It is unknown whether hazardous materials will be encountered in the Work.
 - a. If materials suspected of containing hazardous materials are encountered, do not disturb; immediately notify the Owner and the Owner. the Owner will remove hazardous materials under a separate contract.
6. Hazardous Materials (if asbestos abatement is part of Work of this Contract): Hazardous materials are present in construction to be selectively demolished. A report on the presence of hazardous materials is on file for review and use. Examine report to become aware of locations where hazardous materials are present.
 - a. Hazardous material remediation is specified elsewhere in the Contract Documents.
 - b. Do not disturb hazardous materials or items suspected of containing hazardous materials except under procedures specified elsewhere in the Contract Documents.
7. Storage or sale of removed items or materials on-site is not permitted.
8. Utility Service: Maintain existing utilities indicated to remain in service and protect them against damage during selective demolition operations.
 - a. Maintain fire-protection facilities in service during selective demolition operations.

H. Warranty

1. Existing Warranties: Remove, replace, patch, and repair materials and surfaces cut or damaged during selective demolition, by methods and with materials so as not to void existing warranties.

1.2 PRODUCTS (Not Used)

1.3 EXECUTION

A. Utility Services And Mechanical/Electrical Systems

1. Existing Services/Systems: Maintain services/systems indicated to remain and protect them against damage during selective demolition operations.
2. Service/System Requirements: Locate, identify, disconnect, and seal or cap off indicated utility services and mechanical/electrical systems serving areas to be selectively demolished.
 - a. the Owner will arrange to shut off indicated services/systems when requested by Contractor.
 - b. Arrange to shut off indicated utilities with utility companies.
 - c. If services/systems are required to be removed, relocated, or abandoned, before proceeding with selective demolition provide temporary services/systems that bypass area of selective demolition and that maintain continuity of services/systems to other parts of building.
 - d. Cut off pipe or conduit in walls or partitions to be removed. Cap, valve, or plug and seal remaining portion of pipe or conduit after bypassing.
 - 1) Where entire wall is to be removed, existing services/systems may be removed with removal of the wall.

B. Preparation

1. Site Access and Temporary Controls: Conduct selective demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.
2. Temporary Facilities: Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.
 - a. Provide protection to ensure safe passage of people around selective demolition area and to and from occupied portions of building.
 - b. Provide temporary weather protection, during interval between selective demolition of existing construction on exterior surfaces and new construction, to prevent water leakage and damage to structure and interior areas.

02 - Existing Conditions

- c. Protect walls, ceilings, floors, and other existing finish work that are to remain or that are exposed during selective demolition operations.
 - d. Cover and protect furniture, furnishings, and equipment that have not been removed.
 - e. Comply with requirements for temporary enclosures, dust control, heating, and cooling.
3. Temporary Shoring: Provide and maintain shoring, bracing, and structural supports as required to preserve stability and prevent movement, settlement, or collapse of construction and finishes to remain, and to prevent unexpected or uncontrolled movement or collapse of construction being demolished.
- a. Strengthen or add new supports when required during progress of selective demolition.

C. Selective Demolition, General

- 1. General: Demolish and remove existing construction only to the extent required by new construction and as indicated. Use methods required to complete the Work within limitations of governing regulations and as follows:
 - a. Proceed with selective demolition systematically, from higher to lower level. Complete selective demolition operations above each floor or tier before disturbing supporting members on the next lower level.
 - b. Neatly cut openings and holes plumb, square, and true to dimensions required. Use cutting methods least likely to damage construction to remain or adjoining construction. Use hand tools or small power tools designed for sawing or grinding, not hammering and chopping, to minimize disturbance of adjacent surfaces. Temporarily cover openings to remain.
 - c. Cut or drill from the exposed or finished side into concealed surfaces to avoid marring existing finished surfaces.
 - d. Do not use cutting torches until work area is cleared of flammable materials. At concealed spaces, such as duct and pipe interiors, verify condition and contents of hidden space before starting flame-cutting operations. Maintain fire watch and portable fire-suppression devices during flame-cutting operations.
 - e. Maintain adequate ventilation when using cutting torches.
 - f. Remove decayed, vermin-infested, or otherwise dangerous or unsuitable materials and promptly dispose of off-site.
 - g. Remove structural framing members and lower to ground by method suitable to avoid free fall and to prevent ground impact or dust generation.
 - h. Locate selective demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.
 - i. Dispose of demolished items and materials promptly. Comply with requirements in Division 01 Section "Construction Waste Management And Disposal".
- 2. Reuse of Building Elements: Project has been designed to result in end-of-Project rates for reuse of building elements as follows. Do not demolish building elements beyond what is indicated on Drawings without the Owner's approval.
 - a. Building Structure and Shell: 75 **OR** 100, **as directed**, percent.
 - b. Nonshell Elements: 50 percent.
- 3. Removed and Salvaged Items:
 - a. Clean salvaged items.
 - b. Pack or crate items after cleaning. Identify contents of containers.
 - c. Store items in a secure area until delivery to the Owner.
 - d. Transport items to the Owner's storage area on-site **OR** off-site **OR** designated by the Owner **OR** indicated on Drawings, **as directed**.
 - e. Protect items from damage during transport and storage.
- 4. Removed and Reinstalled Items:
 - a. Clean and repair items to functional condition adequate for intended reuse. Paint equipment to match new equipment.
 - b. Pack or crate items after cleaning and repairing. Identify contents of containers.
 - c. Protect items from damage during transport and storage.

- d. Reinstall items in locations indicated. Comply with installation requirements for new materials and equipment. Provide connections, supports, and miscellaneous materials necessary to make item functional for use indicated.
 5. Existing Items to Remain: Protect construction indicated to remain against damage and soiling during selective demolition. When permitted by the Owner, items may be removed to a suitable, protected storage location during selective demolition and cleaned, **as directed**, and reinstalled in their original locations after selective demolition operations are complete.
- D. Selective Demolition Procedures For Specific Materials
1. Concrete: Demolish in small sections. Cut concrete to a depth of at least **3/4 inch (19 mm)** at junctures with construction to remain, using power-driven saw. Dislodge concrete from reinforcement at perimeter of areas being demolished, cut reinforcement, and then remove remainder of concrete indicated for selective demolition. Neatly trim openings to dimensions indicated.
OR
Concrete: Demolish in sections. Cut concrete full depth at junctures with construction to remain and at regular intervals, using power-driven saw, then remove concrete between saw cuts.
 2. Masonry: Demolish in small sections. Cut masonry at junctures with construction to remain, using power-driven saw, then remove masonry between saw cuts.
 3. Concrete Slabs-on-Grade: Saw-cut perimeter of area to be demolished, then break up and remove.
 4. Resilient Floor Coverings: Remove floor coverings and adhesive according to recommendations in RFCI-WP and its Addendum.
 - a. Remove residual adhesive and prepare substrate for new floor coverings by one of the methods recommended by RFCI.
 5. Roofing: Remove no more existing roofing than can be covered in one day by new roofing and so that building interior remains watertight and weathertight. Refer to Division 07 for new roofing requirements.
 - a. Remove existing roof membrane, flashings, copings, and roof accessories.
 - b. Remove existing roofing system down to substrate.
 6. Air-Conditioning Equipment: Remove equipment without releasing refrigerants.
- E. Disposal Of Demolished Materials
1. General: Except for items or materials indicated to be recycled, **as directed**, reused, salvaged, reinstalled, or otherwise indicated to remain the Owner's property, remove demolished materials from Project site and legally dispose of them in an EPA-approved landfill.
 - a. Do not allow demolished materials to accumulate on-site.
 - b. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
 - c. Remove debris from elevated portions of building by chute, hoist, or other device that will convey debris to grade level in a controlled descent.
 - d. Comply with requirements specified in Division 01 Section "Construction Waste Management And Disposal".
 2. Burning: Do not burn demolished materials.
OR
Burning: Burning of demolished materials will be permitted only at designated areas on the Owner's property, **as directed**, provided required permits are obtained. Provide full-time monitoring for burning materials until fires are extinguished.
 3. Disposal: Transport demolished materials and dispose of at designated spoil areas on the Owner's property.
OR
Disposal: Transport demolished materials off the Owner's property and legally dispose of them.
- F. Cleaning

1. Clean adjacent structures and improvements of dust, dirt, and debris caused by selective demolition operations. Return adjacent areas to condition existing before selective demolition operations began.

G. Selective Demolition Schedule

1. Existing Items **OR** Construction, **as directed**, to Be Removed, as directed by the Owner.
2. Existing Items to Be Removed and Salvaged, as directed by the Owner.
3. Existing Items to Be Removed and Reinstalled, as directed by the Owner.
4. Existing Items to Remain, as directed by the Owner.

END OF SECTION 02 41 13 13a

SECTION 02 41 16 13 - BUILDING DEMOLITION

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for building demolition. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Demolition and removal of buildings and site improvements.
 - b. Abandoning in place **OR** Removing, **as directed**, below-grade construction.
 - c. Disconnecting, capping or sealing, and abandoning in-place **OR** removing, **as directed**, site utilities.
 - d. Salvaging items for reuse by the Owner.

C. Definitions

1. Remove: Detach items from existing construction and legally dispose of them off-site unless indicated to be removed and salvaged.
2. Remove and Salvage: Carefully detach from existing construction, in a manner to prevent damage, and deliver to the Owner ready for reuse. Include fasteners or brackets needed for reattachment elsewhere.

D. Materials Ownership

1. Unless otherwise indicated, demolition waste becomes property of Contractor.
2. Historic items, relics, antiques, and similar objects including, but not limited to, cornerstones and their contents, commemorative plaques and tablets, and other items of interest or value to the Owner that may be uncovered during demolition remain the property of the Owner.
 - a. Carefully salvage in a manner to prevent damage and promptly return to the Owner.

E. Informational Submittals

1. Qualification Data: For refrigerant recovery technician.
2. Proposed Protection Measures: Submit informational report, including drawings, that indicates the measures proposed for protecting individuals and property, for environmental protection, for dust control and, for noise control, **as directed**. Indicate proposed locations and construction of barriers.
 - a. Adjacent Buildings: Detail special measures proposed to protect adjacent buildings to remain.
3. Schedule of Building Demolition Activities: Indicate the following:
 - a. Detailed sequence of demolition work, with starting and ending dates for each activity.
 - b. Temporary interruption of utility services.
 - c. Shutoff and capping or re-routing of utility services.
4. Inventory: Submit a list of items to be removed and salvaged and deliver to the Owner prior to start of demolition.
5. Predemolition Photographs **OR** Video, **as directed**: Show existing conditions of adjoining construction and site improvements, including finish surfaces, that might be misconstrued as damage caused by building demolition operations. Submit before the Work begins.
6. Landfill Records: Indicate receipt and acceptance of hazardous wastes by a landfill facility licensed to accept hazardous wastes.
7. Statement of Refrigerant Recovery: Signed by refrigerant recovery technician responsible for recovering refrigerant, stating that all refrigerant that was present was recovered and that

recovery was performed according to EPA regulations. Include name and address of technician and date refrigerant was recovered.

F. Quality Assurance

1. Refrigerant Recovery Technician Qualifications: Certified by EPA-approved certification program.
2. Regulatory Requirements: Comply with governing EPA notification regulations before beginning demolition. Comply with hauling and disposal regulations of authorities having jurisdiction.
3. Standards: Comply with ANSI/ASSE A10.6 and NFPA 241.
4. Predemolition Conference: Conduct conference at Project site.
 - a. Inspect and discuss condition of construction to be demolished.
 - b. Review structural load limitations of existing structures.
 - c. Review and finalize building demolition schedule and verify availability of demolition personnel, equipment, and facilities needed to make progress and avoid delays.
 - d. Review and finalize protection requirements.
 - e. Review procedures for noise control and dust control.
 - f. Review procedures for protection of adjacent buildings.
 - g. Review items to be salvaged and returned to the Owner.

G. Project Conditions

1. Buildings to be demolished will be vacated and their use discontinued before start of the Work.
2. Buildings immediately adjacent to demolition area will be occupied. Conduct building demolition so operations of occupied buildings will not be disrupted.
 - a. Provide not less than 72 hours' notice of activities that will affect operations of adjacent occupied buildings.
 - b. Maintain access to existing walkways, exits, and other facilities used by occupants of adjacent buildings.
 - 1) Do not close or obstruct walkways, exits, or other facilities used by occupants of adjacent buildings without written permission from authorities having jurisdiction.
3. the Owner assumes no responsibility for buildings and structures to be demolished.
 - a. Conditions existing at time of inspection for bidding purpose will be maintained by the Owner as far as practical.
 - b. Before building demolition, the Owner will remove certain items, as directed by the Owner.
4. Hazardous Materials: It is not expected that hazardous materials will be encountered in the Work.
 - a. Hazardous materials will be removed by the Owner before start of the Work.
 - b. If materials suspected of containing hazardous materials are encountered, do not disturb; immediately notify Architect and the Owner. Hazardous materials will be removed by the Owner under a separate contract.

OR

- Hazardous Materials: Hazardous materials are present in buildings and structures to be demolished. A report on the presence of hazardous materials is on file for review and use. Examine report to become aware of locations where hazardous materials are present.
- a. Hazardous material remediation is specified elsewhere in the Contract Documents.
 - b. Do not disturb hazardous materials or items suspected of containing hazardous materials except under procedures specified elsewhere in the Contract Documents.
 - c. the Owner will provide safety data sheets for materials that are known to be present in buildings and structures to be demolished because of building operations or processes performed there.
5. On-site storage or sale of removed items or materials is not permitted.

H. Coordination

1. Arrange demolition schedule so as not to interfere with the Owner's on-site operations **OR** operations of adjacent occupied buildings, **as directed**.

1.2 PRODUCTS

A. Soil Materials

1. Satisfactory Soils: Satisfactory Soils: For soils which is to be used for backfilling voids that result from demolition operations in below-grade areas, comply with requirements in Division 31 Section "Earth Moving".

1.3 EXECUTION

A. Examination

1. Verify that utilities have been disconnected and capped before starting demolition operations.
2. Review Project Record Documents of existing construction provided by the Owner. the Owner does not guarantee that existing conditions are same as those indicated in Project Record Documents.
3. Inventory and record the condition of items to be removed and salvaged. Provide photographs **OR** video, **as directed**, of conditions that might be misconstrued as damage caused by salvage operations.
4. Perform **OR** Engage a professional engineer to perform, **as directed**, an engineering survey of condition of building to determine whether removing any element might result in structural deficiency or unplanned collapse of any portion of structure or adjacent structures during building demolition operations.
 - a. Steel Tendons: Locate tensioned steel tendons and include recommendations for de-tensioning.
5. Verify that hazardous materials have been remediated before proceeding with building demolition operations.

B. Preparation

1. Refrigerant: Remove refrigerant from mechanical equipment according to 40 CFR 82 and regulations of authorities having jurisdiction before starting demolition.
2. Existing Utilities: Locate, identify, disconnect, and seal or cap off indicated utilities serving buildings and structures to be demolished.
 - a. the Owner will arrange to shut off indicated utilities when requested by Contractor.
OR
Arrange to shut off indicated utilities with utility companies, **as directed**.
 - b. If removal, relocation, or abandonment of utility services will affect adjacent occupied buildings, then provide temporary utilities that bypass buildings and structures to be demolished and that maintain continuity of service to other buildings and structures.
 - c. Cut off pipe or conduit a minimum of **24 inches (610 mm)** below grade. Cap, valve, or plug and seal remaining portion of pipe or conduit after bypassing according to requirements of authorities having jurisdiction.
OR
Existing Utilities: Refer to Division 22 AND Division 26 for shutting off, disconnecting, removing, and sealing or capping utilities. Do not start demolition work until utility disconnecting and sealing have been completed and verified in writing, **as directed**.
3. Temporary Shoring: Provide and maintain interior and exterior shoring, bracing, or structural support to preserve stability and prevent unexpected movement or collapse of construction being demolished.
 - a. Strengthen or add new supports when required during progress of demolition.
4. Salvaged Items: Comply with the following:
 - a. Clean salvaged items of dirt and demolition debris.
 - b. Pack or crate items after cleaning. Identify contents of containers.
 - c. Store items in a secure area until delivery to the Owner.
 - d. Transport items to storage area designated by the Owner **OR** indicated on Drawings, **as directed**.
 - e. Protect items from damage during transport and storage.

02 - Existing Conditions

- C. Protection
1. Existing Facilities: Protect adjacent walkways, loading docks, building entries, and other building facilities during demolition operations. Maintain exits from existing buildings.
 2. Existing Utilities: Maintain utility services to remain and protect from damage during demolition operations.
 - a. Do not interrupt existing utilities serving adjacent occupied or operating facilities unless authorized in writing by the Owner and authorities having jurisdiction.
 - b. Provide temporary services during interruptions to existing utilities, as acceptable to the Owner and authorities having jurisdiction.
 - 1) Provide at least 72 hours' notice to occupants of affected buildings if shutdown of service is required during changeover.
 3. Temporary Protection: Erect temporary protection, such as walks, fences, railings, canopies, and covered passageways, where required by authorities having jurisdiction, and as indicated. Comply with requirements in Division 01 Section "Temporary Facilities And Controls".
 - a. Protect adjacent buildings and facilities from damage due to demolition activities.
 - b. Protect existing site improvements, appurtenances, and landscaping to remain.
 - c. Erect a plainly visible fence around drip line of individual trees or around perimeter drip line of groups of trees to remain.
 - d. Provide temporary barricades and other protection required to prevent injury to people and damage to adjacent buildings and facilities to remain.
 - e. Provide protection to ensure safe passage of people around building demolition area and to and from occupied portions of adjacent buildings and structures.
 - f. Protect walls, windows, roofs, and other adjacent exterior construction that are to remain and that are exposed to building demolition operations.
 - g. Erect and maintain dustproof partitions and temporary enclosures to limit dust, noise, and dirt migration to occupied portions of adjacent buildings.
 4. Remove temporary barriers and protections where hazards no longer exist. Where open excavations or other hazardous conditions remain, leave temporary barriers and protections in place.
- D. Demolition, General
1. General: Demolish indicated existing buildings and site improvements completely. Use methods required to complete the Work within limitations of governing regulations and as follows:
 - a. Do not use cutting torches until work area is cleared of flammable materials. Maintain portable fire-suppression devices during flame-cutting operations.
 - b. Maintain fire watch during and for a specified time after flame cutting operations as directed by the Owner.
 - c. Maintain adequate ventilation when using cutting torches.
 - d. Locate building demolition equipment and remove debris and materials so as not to impose excessive loads on supporting walls, floors, or framing.
 2. Engineering Surveys: During demolition, perform surveys to detect hazards that may result from building demolition activities.
 3. Site Access and Temporary Controls: Conduct building demolition and debris-removal operations to ensure minimum interference with roads, streets, walks, walkways, and other adjacent occupied and used facilities.
 - a. Do not close or obstruct streets, walks, walkways, or other adjacent occupied or used facilities without permission from the Owner and authorities having jurisdiction. Provide alternate routes around closed or obstructed traffic ways if required by authorities having jurisdiction.
 - b. Use water mist and other suitable methods to limit spread of dust and dirt. Comply with governing environmental-protection regulations. Do not use water when it may damage adjacent construction or create hazardous or objectionable conditions, such as ice, flooding, and pollution.
 4. Explosives: Use of explosives is not permitted, **unless directed otherwise**.

E. Demolition By Mechanical Means

1. Proceed with demolition of structural framing members systematically, from higher to lower level. Complete building demolition operations above each floor or tier before disturbing supporting members on the next lower level.
2. Remove debris from elevated portions of the building by chute, hoist, or other device that will convey debris to grade level in a controlled descent.
 - a. Remove structural framing members and lower to ground by method suitable to minimize ground impact and dust generation.
3. Salvage: Items to be salvaged are indicated on Drawings **OR** below, **as directed**:
 - a. Doors and door hardware.
 - b. Windows.
 - c. Cabinets.
 - d. Mirrors.
 - e. Chalkboards.
 - f. Tackboards.
 - g. Marker boards.
 - h. Plumbing fixtures.
 - i. Other items as directed.
4. Below-Grade Construction: Abandon foundation walls and other below-grade construction. Cut below-grade construction flush with grade.

OR

Below-Grade Construction: Demolish foundation walls and other below-grade construction that are within footprint of new construction and extending **5 feet (1.5 m)** outside footprint indicated for new construction. Abandon below-grade construction outside this area.

 - a. Remove below-grade construction, including basements, foundation walls, and footings, completely **OR** to at least **6 inches (150 mm)** below grade **OR** to at least **12 inches (300 mm)** below grade **OR** to depths indicated, **as directed**.

OR

Below-Grade Construction: Demolish foundation walls and other below-grade construction.

 - b. Remove below-grade construction, including basements, foundation walls, and footings, completely **OR** to at least **6 inches (150 mm)** below grade **OR** to at least **12 inches (300 mm)** below grade **OR** to depths indicated, **as directed**.
5. Existing Utilities: Abandon existing utilities and below-grade utility structures. Cut utilities flush with grade.

OR

Existing Utilities: Demolish existing utilities and below-grade utility structures that are within **5 feet (1.5 m)** outside footprint indicated for new construction. Abandon utilities outside this area.

 - a. Fill abandoned utility structures with satisfactory soil materials **OR** recycled pulverized concrete, **as directed**, according to backfill requirements in Division 31 Section "Earth Moving".
 - b. Piping: Disconnect piping at unions, flanges, valves, or fittings.
 - c. Wiring Ducts: Disassemble into unit lengths and remove plug-in and disconnecting devices.

OR

Existing Utilities: Demolish and remove existing utilities and below-grade utility structures.

 - a. Piping: Disconnect piping at unions, flanges, valves, or fittings.
 - b. Wiring Ducts: Disassemble into unit lengths and remove plug-in and disconnecting devices.

F. Demolition By Explosives – ONLY IF APPROVED BY THE OWNER

1. Explosives: Perform explosive demolition according to governing regulations.
 - a. Obtain written permission from authorities having jurisdiction before bringing explosives to, or using explosives on, Project site.
 - b. Do not damage adjacent structures, property, or site improvements when using explosives.
2. Comply with recommendation in Explosives Consultant's report.

02 - Existing Conditions

- G. Site Restoration
1. Below-Grade Areas: Rough grade below-grade areas ready for further excavation or new construction.
OR
Below-Grade Areas: Completely fill below-grade areas and voids resulting from building demolition operations with satisfactory soil materials **OR** recycled pulverized concrete **OR** recycled pulverized masonry, **as directed**, according to backfill requirements in Division 31 Section "Earth Moving".
 2. Site Grading: Uniformly rough grade area of demolished construction to a smooth surface, free from irregular surface changes. Provide a smooth transition between adjacent existing grades and new grades.
- H. Repairs
1. Promptly repair damage to adjacent buildings caused by demolition operations.
- I. Disposal Of Demolished Materials
1. Remove demolition waste materials from Project site and legally dispose of them in EPA approved landfill acceptable to authorities having jurisdiction. See Division 01 Section "Construction Waste Management And Disposal" for recycling and disposal of demolition waste.
 - a. Do not allow demolished materials to accumulate on-site.
 - b. Remove and transport debris in a manner that will prevent spillage on adjacent surfaces and areas.
 2. Do not burn demolished materials.
- J. Cleaning
1. Clean adjacent structures and improvements of dust, dirt, and debris caused by building demolition operations. Return adjacent areas to condition existing before building demolition operations began.
 - a. Clean roadways of debris caused by debris transport.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 58 13 00 - SNOW AND OTHER TEMPORARY FENCING

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of snow and other temporary fencing. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.
2. Shop drawings shall be submitted for approval.

1.2 PRODUCTS

A. Pickets:

1. Size: Wood pickets shall be 3/8 inch thick, 1-1/2 inches wide, and 48 inches high.
2. Coating: Red oil paint or stain.
3. Spacing: Approximately 2 inches apart.
4. Attachment: Bind together with 3 double strands of wire.

B. Framework:

1. Materials: Wire shall be 13 ga. galvanized steel, complying with ASTM A 641.
2. Types: The framework shall consist of 3 parallel double strands of wire twisted between pickets to hold them securely in place.
3. Wire Connectors: Wire for attaching fabric to metal posts shall be 9 ga.
4. Staples and Nails shall comply with Fed. Spec. FF-N-105. Staples and nails shall be zinc-coated and of sufficient length for purpose required.

C. Gates:

1. Frame: Frame shall consist of 2 parallel horizontal wooden members with pickets attached at two-inch spacing.
2. Bracing: 2 wooden members laced diagonally on the gate between the frame boards.
3. Hardware shall include 2 strap hinges, latching device, and stop bar, all of zinc-coated steel, in compliance with ASTM A 153.

D. Supports:

1. Steel: Line posts and uprights shall be drive type, T sections, and provided with suitable anchor plate. The sections shall be hot-rolled steel complying with ASTM A 702, galvanized in compliance with ASTM A 123. The T sections shall have the following minimum sizes:

Post Length (Feet) Post Weight (Pounds)

5	7.32
5 1/2	7.99
6	8.65
6 1/2	9.32
7	9.98
7 1/2	10.64
8	11.31
9	12.64
10	13.97

2. Wood: Posts shall be cut from cedar, Douglas fir, pine, or other approved species of timber. Posts shall be peeled, treated, dressed, and cured. All wood posts and braces shall be given a pressure preservative treatment in a closed retort. The treatment shall comply with Fed. Spec. TT-W-571. Wood cut or sawed after treatment shall have the cut surfaces well brush-coated with the preservative used in the treatment.
3. Braces: Steel braces shall have same configuration as line posts and uprights without the anchor plate. Wood braces shall be treated No. 2 or better grade, Douglas fir or southern yellow pine. Braces shall meet all of the requirements for wood posts.
4. Location: Posts shall be evenly spaced to adequately support the fence framework.

1.3 EXECUTION

A. Installation

1. Wood Posts: Hold in line in a true vertical position by temporary bracing until backfilling is completed. Compact by hand tamping or other suitable methods to a density comparable to that of adjacent ground.
2. Steel Posts: Hold in a vertical position and drive to the required depths by an approved post driver. Post tops shall not be damaged during driving.
3. Corner, Brace, Or End Panels: Construct corner, brace, or end panels at the beginning and terminal ends, at gate openings, at all intersections, and at all corners or changes in horizontal alignment of fences, in existing fence on both sides of junction with new fence (except when junction is at a corner already braced).
4. Pull Posts shall be constructed when the distance of unbraced fencing exceeds 640 feet. Pull posts shall be spaced equidistant in the fence at intervals of 640 feet or less.
5. Framework Installation: Stretch to proper tension and securely fasten to posts. Top and bottom wires of fabric shall be tied or stapled to each post. Tie or staple every other wire to alternating posts. Every wire shall be tied or stapled to corner, pull, end, and gate posts. Wire for tied fabrics shall be 9 ga.
6. Picket Replacement: Where required, new pickets shall be securely fastened into the existing wire framework using 13 ga. galvanized wire.
7. Restretching Existing Fabric: Fabric designated to be restretched shall be restretched to proper tension and refastened to posts. Excess fabric extending beyond the post shall be removed.

END OF SECTION 02 58 13 00

SECTION 02 61 00 00 - EXCAVATION AND HANDLING OF CONTAMINATED MATERIAL

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for excavation and handling of contaminated material. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Shop Drawings: Separate cross-sections of each area before and after excavation and after backfilling.
2. Product Data: Work Plan within 30 calendar days after notice to proceed. No work at the site, with the exception of site inspections and surveys, shall be performed until the Work Plan is approved. The Contractor shall allow 30 calendar days in the schedule for the Owner's review. No adjustment for time or money will be made if resubmittals of the Work Plan are required due to deficiencies in the plan. At a minimum, the Work Plan shall include:
 - a. Schedule of activities.
 - b. Method of excavation and equipment to be used.
 - c. Shoring or side-wall slopes proposed.
 - d. Dewatering plan.
 - e. Storage methods and locations for liquid and solid contaminated material.
 - f. Borrow sources and haul routes.
 - g. Decontamination procedures.
 - h. Spill contingency plan.
3. Closure Report: Three (3) copies of the Closure Report within 14 calendar days of work completion at the site.
4. Test Reports
 - a. Backfill
 - b. Surveys
 - c. Confirmation Sampling and Analysis
 - d. Sampling of Stored Material
 - e. Sampling Liquid
 - f. Compaction
 - g. Test results.

C. Surveys

1. Surveys shall be performed immediately prior to and after excavation of contaminated material to determine the volume of contaminated material removed. Surveys shall also be performed immediately after backfill of each excavation. The Contractor shall provide cross-sections on **25 foot (7.6 meter)** intervals and at break points for all excavated areas. Locations of confirmation samples shall also be surveyed and shown on the drawings.

D. Regulatory Requirements

1. Permits and Licenses: The Contractor shall obtain required federal, state, and local permits for excavation and storage of contaminated material. Permits shall be obtained at no additional cost the Owner.
2. Air Emissions: Air emissions shall be monitored and controlled in accordance with the Owner's Environmental Requirements.

E. Chemical Testing

1. Required sampling and chemical analysis shall be conducted in accordance with local requirements and the Owner's requirements.

02 - Existing Conditions

F. Scheduling

1. The Contractor shall notify the Owner five (5) calendar days prior to the start of excavation of contaminated material. The Owner will **OR** The Contractor shall, **as directed**, be responsible for contacting regulatory agencies in accordance with the applicable reporting requirements.

1.2 PRODUCTS

A. Backfill

1. Backfill material shall be obtained from the location indicated on the drawings **OR** offsite sources approved by the Owner, **as directed**. Backfill shall be classified in accordance with ASTM D 2487 as GW, GP, GM, GC, SW, SP, SM, SC, ML, MH, CL, or CH and shall be free from roots and other organic matter, trash, debris, snow, ice or frozen materials. Backfill material shall be tested for the parameters listed below at a frequency of once per 3000 **cubic yards (cubic meters)**. A minimum of one set of classification tests shall be performed per borrow source. One backfill sample per borrow source shall also be collected and tested for the chemical parameters listed below.

<u>Physical Parameter</u>	<u>Test Method</u>
Grain Size	ASTM D 422
Compaction	ASTM D 698

Backfill shall not be used until borrow source chemical and physical test results have been submitted and approved.

B. Spill Response Materials

1. The Contractor shall provide appropriate spill response materials including, but not limited to the following: containers, adsorbents, shovels, and personal protective equipment. Spill response materials shall be available at all times when contaminated materials/wastes are being handled or transported. Spill response materials shall be compatible with the type of materials and contaminants being handled.

1.3 EXECUTION

A. Existing Structures And Utilities

1. No excavation shall be performed until site utilities have been field located. The Contractor shall take the necessary precautions to ensure no damage occurs to existing structures and utilities. Damage to existing structures and utilities resulting from the Contractor's operations shall be repaired at no additional cost to the Owner. Utilities encountered that were not previously shown or otherwise located shall not be disturbed without approval from the Owner.

B. Clearing

1. Clearing shall be performed to the limits shown on the drawings in accordance with Division 2 Section "Site Clearing."

C. Contaminated Material Removal

1. Excavation: Areas of contamination shall be excavated to the depth and extent shown on the drawings and not more than **0.2 feet (60 mm)** beyond the depth and extent shown on the drawings unless directed by the Owner. Excavation shall be performed in a manner that will limit spills and the potential for contaminated material to be mixed with uncontaminated material. An excavation log describing visible signs of contamination encountered shall be maintained for each area of excavation. Excavation logs shall be prepared in accordance with ASTM D 5434.
2. Shoring: If workers must enter the excavation, it shall be evaluated, shored, sloped or braced as required by U.S. Army Corps of Engineers (USACE) EM 385-1-1 and U.S. National Archives and Records Administration (NARA) 29 CFR 1926 section 650.

3. Dewatering: Surface water shall be diverted to prevent entry into the excavation. Dewatering shall be limited to that necessary to assure adequate access, a safe excavation, prevent the spread of contamination, and to ensure that compaction requirements can be met. No dewatering shall be performed without prior approval of the Owner.
- D. Confirmation Sampling And Analysis
1. the Owner shall be present to inspect the removal of contaminated material from each site. After all material suspected of being contaminated has been removed, the excavation shall be examined for evidence of contamination. If the excavation appears to be free of contamination, field analysis shall be used to determine the presence of contamination using a real time vapor monitoring instrument **OR** immunoassay field kits, **as directed**. Excavation of additional material shall be as directed by the Owner. After all suspected contaminated material is removed, confirmation samples shall be collected and analyzed.
 2. Samples shall be collected at a frequency as directed by the Owner. A minimum of one sample shall be collected from the bottom and each side wall of the excavation. Based on test results, the Contractor shall propose any additional excavation which may be required to remove material which is contaminated above action levels. Additional excavation shall be subject to approval by the Owner. Locations of samples shall be marked in the field and documented on the as-built drawings.
- E. Contaminated Material Storage
1. Material shall be placed in temporary storage immediately after excavation **OR** after treatment while awaiting test results, **as directed**. The following paragraphs describe acceptable methods of material storage. Storage units shall be in good condition and constructed of materials that are compatible with the material or liquid to be stored. If multiple storage units are required, each unit shall be clearly labeled with an identification number and a written log shall be kept to track the source of contaminated material in each temporary storage unit.
 2. Stockpiles
 - a. Stockpiles shall be constructed to isolate stored contaminated material from the environment. The maximum stockpile size shall be as directed by the Owner. Stockpiles shall be constructed to include:
 - 1) A chemically resistant geomembrane liner free of holes and other damage. Non-reinforced geomembrane liners shall have a minimum thickness of **20 mils (0.5 mm)**. Scrim reinforced geomembrane liners shall have a minimum weight of **40 lbs. per 1000 square feet (20 kg/100 square meters)**. The ground surface on which the geomembrane is to be placed shall be free of rocks greater than **0.5 inches (12 mm)** in diameter and any other object which could damage the membrane.
 - 2) Geomembrane cover free of holes or other damage to prevent precipitation from entering the stockpile. Non-reinforced geomembrane covers shall have a minimum thickness of **10 mils (0.25 mm)**. Scrim reinforced geomembrane covers shall have a minimum weight of **26 lbs. per 1000 square feet (13 kg/100 square meters)**. The cover material shall be extended over the berms and anchored or ballasted to prevent it from being removed or damaged by wind.
 - 3) Berms surrounding the stockpile, a minimum of **12 inches (300 mm)** in height. Vehicle access points shall also be bermed.
 - 4) The liner system shall be sloped to allow collection of leachate. Storage and removal of liquid which collects in the stockpile, in accordance with paragraph Liquid Storage.
 3. Roll-Off Units: Roll-off units used to temporarily store contaminated material shall be water tight. A cover shall be placed over the units to prevent precipitation from contacting the stored material. The units shall be located as shown on the drawings. Liquid which collects inside the units shall be removed and stored in accordance with paragraph Liquid Storage.
 4. Liquid Storage: Liquid collected from excavations and stockpiles shall be temporarily stored in **55 gallon barrels (220 L barrels) OR 500 gallon tanks (2000 L tanks)**, **as directed**. Liquid storage containers shall be water-tight and shall be located as shown on the drawings.

02 - Existing Conditions

- F. Sampling
1. Sampling of Stored Material
 - a. Samples of stored material shall be collected at a frequency as directed by the Owner.
 - b. Stored material with contaminant levels that exceed the action levels shall be treated offsite. Analyses for contaminated material to be taken to an offsite treatment facility shall conform to local, state, and federal criteria as well as to the requirements of the treatment facility. Documentation of all analyses performed shall be furnished to the Owner. Additional sampling and analyses to the extent required by the approved offsite treatment, storage or disposal (TSD) facility shall be the responsibility of the Contractor and shall be performed at no additional cost to the Owner **OR** subject to approval by the Owner, **as directed**.
OR
Stored material with contaminant levels that exceed the action levels shall be treated onsite.
 2. Sampling Liquid
 - a. Liquid collected from excavations **OR** storage areas **OR** decontamination facilities, **as directed**, shall be sampled at a frequency of once for every **500 gallons (2,000 L)** of liquid collected.
 - b. Liquid with contaminant levels that exceed action levels shall be treated offsite. Analyses for contaminated liquid to be taken to an offsite treatment facility shall conform to local, state, and federal criteria as well as to the requirements of the treatment facility. Documentation of all analyses performed shall be furnished to the Owner. Additional sampling and analysis to the extent required by the approved offsite treatment, storage or disposal (TSD) facility receiving the material shall be the responsibility of the Contractor and shall be performed at no additional cost to the Owner **OR** subject to approval by the Owner.
OR
Liquid with contaminant levels that exceed action levels shall be treated onsite.
 3. Sampling Beneath Storage Units
 - a. Samples from beneath each storage unit shall be collected prior to construction of and after removal of the storage unit. Samples shall be collected at a frequency as directed by the Owner from a depth interval of **0 to 0.5 feet (0 to 0.15 m)**.
 - b. Based on test results, soil which has become contaminated above action levels shall be removed at no additional cost to the Owner. Contaminated material which is removed from beneath the storage unit shall be handled in accordance with paragraph Sampling of Stored Material. as directed by the Owner and at no additional cost to the Owner, additional sampling and testing shall be performed to verify areas of contamination found beneath stockpiles have been cleaned up to below action levels.
- G. Spills
1. In the event of a spill or release of a hazardous substance (as designated in NARA 40 CFR 302), pollutant, contaminant, or oil (as governed by the Oil Pollution Act [OPA], 33 U.S.C. 2701 et seq.), the Contractor shall notify the Owner immediately. If the spill exceeds the reporting threshold, the Contractor shall follow the pre-established procedures as described in the Contingency Plan for immediate reporting and containment. Immediate containment actions shall be taken to minimize the effect of any spill or leak. Cleanup shall be in accordance with applicable federal, state, and local regulations. as directed by the Owner, additional sampling and testing shall be performed to verify spills have been cleaned up. Spill cleanup and testing shall be done at no additional cost to the Owner.
- H. Backfilling
1. Confirmation Test Results: Excavations shall be backfilled immediately after all contaminated materials have been removed and confirmation test results have been approved. Backfill shall be placed and compacted to the lines and grades shown on the drawings.

2. **Compaction:** Approved backfill shall be placed in lifts with a maximum loose thickness of **8 inches (200 mm)**. Soil shall be compacted to 90 percent of ASTM D 698 **OR** ASTM D 1557, **as directed**, maximum dry density. Density tests shall be performed at a frequency of once per **10,000 square feet (930 square meters)** per lift. A minimum of one density test shall be performed on each lift of backfill placed. Field in-place dry density shall be determined in accordance with ASTM D 1556, ASTM D 2167, or ASTM D 2922. If ASTM D 2922 is used, a minimum of one in ten tests shall be checked using ASTM D 1556 or ASTM D 2167. Test results from ASTM D 1556 or ASTM D 2167 shall govern if there is a discrepancy with the ASTM D 2922 test results.
- I. **Disposal Requirements**
 1. Offsite disposal of contaminated material shall be in accordance with Division 2 Section "Disposal of Hazardous Materials."
 - J. **Closure Report**
 1. Three copies of a Closure Report shall be prepared and submitted within 14 calendar days of completing work at the site. The report shall be labeled with the contract number, project name, location, date, and name of general contractor. The Closure Report shall include the following information as a minimum:
 - a. A cover letter signed by a responsible company official **OR** Professional Engineer registered in the state of the work who is a responsible company official, **as directed**, certifying that all services involved have been performed in accordance with the terms and conditions of the contract documents and regulatory requirements.
 - b. A narrative report including, but not limited to, the following:
 - 1) site conditions, ground water elevation, and cleanup criteria;
 - 2) excavation logs;
 - 3) field screening readings;
 - 4) quantity of materials removed from each area of contamination;
 - 5) quantity of water/product removed during dewatering;
 - 6) sampling locations and sampling methods;
 - 7) sample collection data such as time of collection and method of preservation;
 - 8) sample chain-of-custody forms; and
 - 9) source of backfill.
 - c. Copies of all chemical and physical test results.
 - d. Copies of all manifests and land disposal restriction notifications.
 - e. Copies of all certifications of final disposal signed by the responsible disposal facility official.
 - f. Waste profile sheets.
 - g. Scale drawings showing limits of each excavation, limits of contamination, known underground utilities within **50 feet (15 m)** of excavation, sample locations, and sample identification numbers. On-site stockpile, storage, treatment, loading, and disposal areas shall also be shown on the drawings.
 - h. **Progress Photographs.** Color photographs shall be used to document progress of the work. A minimum of four views of the site showing the location of the area of contamination, entrance/exit road, and any other notable site conditions shall be taken before work begins. After work has been started, activities at each work location shall be photographically recorded daily **OR** weekly, **as directed**. Photographs shall be a minimum of **3 x 5 inches (76.2 x 127.0 mm)** and shall include:
 - 1) Soil removal and sampling.
 - 2) Dewatering operations.
 - 3) Unanticipated events such as spills and the discovery of additional contaminated material.
 - 4) Contaminated material/water storage, handling, treatment, and transport.
 - 5) Site or task-specific employee respiratory and personal protection.
 - 6) Fill placement and grading.

02 - Existing Conditions

- 7) Post-construction photographs. After completion of work at each site, the Contractor shall take a minimum of four views of each excavation site. A digital version of all photos shown in the report shall be included with the Closure Report. Photographs shall be a minimum of **3 inches by 5 inches (76mm by 127 mm)** and shall be mounted back-to-back in double face plastic sleeves punched to fit standard three ring binders. Each print shall have an information box attached. The box shall be typewritten and arranged as follows:
- Project Name: Direction of View:
 - Location: Date/Time:
 - Photograph No.: Description of View:

END OF SECTION 02 61 00 00

SECTION 02 61 13 00 - PRECISION TESTING OF UNDERGROUND FUEL OIL TANKS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing of labor and equipment for the precision testing of underground fuel oil tanks. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

1.2 PRODUCTS - (Not Used)

1.3 EXECUTION

- A. The Contractor shall furnish all the necessary labor and equipment to complete the Precision Fuel Oil Tank Testing at various buildings under the jurisdiction of the Owner. The pertinent quantity and the capacity of the tanks will be listed on each Job Order. When the contractor elects to use a volumetric tank tester, it shall be responsible to fill up and "top off" tank to a maximum of 100 gallons prior to the start of testing. The cost to "top off" tank will be the contractor's responsibility.
- B. The Contractor shall provide the material and labor necessary for the drilling and tapping of the existing oil tank manhole cover and the installation of new air bleeder valves. The air bleeder valve shall be a Hoffman Specialty #40 or #41 or their approved equal.
- C. Coordination of Work: Prior to performing any test, the contractor shall notify the Owner of the scheduled test date. Designated personnel from the Owner shall take necessary actions to coordinate fuel oil delivery and shall inform the contractor of the date and time of the fuel delivery. The contractor shall ascertain that the tanks are filled to capacity and shall be responsible to have the tanks "topped off" up to a maximum of 100 gallons prior to the start of testing. The contractor shall make arrangements to perform the testing within forty-eight (48) hours of notification that the oil tank has been filled. The Contractor's responsibility to "top off" tank only applies when the contractor elects to utilize a volumetric tank tester.
- D. Test Equipment: The Contractor shall be limited to using state approved Precision Testing methods equal to the following:
 - Ainlay Tank Tegrity Tester
 - Horner EZY 3
 - Hunter Leak Lokator
 - Tank Auditor
 - Petro Tite
- E. Test Results: The Contractor will be required to submit written reports of test results as noted below.
 1. The test reports' format shall be approved by the testing equipment manufacturer and the state.
 2. The Contractor shall submit one (1) type written report within seven (7) days of completion of the testing to the Owner.
 3. The Contractor shall submit one copy of the report to the state within thirty (30) days of completion of the testing. Proof of submission shall be appended to the request for payment.
 4. The test results shall include, but not be limited to:
 - a. Name and/or Number of Building
 - b. Address of Building

02 - Existing Conditions

- c. Date and Time of Test
 - d. Results of test including (Actual Data Calculations Graphs)
 - e. Test Method
 - f. Name and address of Contractor
 - g. Signature of test technician
5. Should the test indicate a leakage condition, the contractor shall perform the following:
- a. Initiate procedure to isolate piping from tank and determine the source of the leak. This work shall be performed after notification of the Owner.
 - b. Submit a written proposal and cost estimate for work required to be performed to repair leak. Recommended proposal shall be submitted to the Owner within 48-hours after determining source of leak. No repair work shall proceed without authorization by the Owner.
 - c. Notify the state of leak discovered in underground buried tank. This notification shall take place within 2 hours of determining source of leak.
 - d. In these cases, the Owner may direct the Contractor to complete the work or exercise its option to perform the required work by its own forces or under separate contract.
6. After completion of the remedial work when applicable, the contractor shall perform a re-test, and shall issue a final test report in aforementioned format. The contractor shall be paid 50% of the bid unit price for the re-test.

END OF SECTION 02 61 13 00

SECTION 02 61 13 00a - HYDROSTATIC PRESSURE TESTING OF AIR RECEIVING TANKS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing of labor and equipment for the hydrostatic pressure testing of air receiving tanks. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

1.2 PRODUCTS - (Not Used)

1.3 EXECUTION

A. General

1. Disconnect all piping and remove safety valve from air receiving tank and temporarily plug all openings on the disconnected tank.
2. Perform hydrostatic test at not less than twice the charging pressure, at 70 degrees Fahrenheit, for fifteen (15) minutes in accordance with the Administrative Code of the applicable Authority.
3. Test shall be performed in the presence of a representative of the Inspection Unit. Contractor shall notify the Owner's Inspection Unit seventy-two (72) hours prior to test.
4. At the completion of each test, contractor shall reconnect all piping and reinstall all removed equipment.
5. The Contractor shall issue an affidavit of test to the Owner. The affidavit shall state the date of test, testing pressure and the maximum working pressure allowable until the next test.
6. Furnish and install a glass enclosed aluminum frame of suitable size to display affidavit. Frame shall be open at the top for easy access to affidavit. Frame shall be firmly affixed in a permanent location adjacent to receiver tank as directed by the Owner.

B. Intent: Pursuant to the provisions of the Administrative Code of applicable Authority, and in the interest of public safety, the Owner requires that:

1. All compressed air tanks shall be tested by a person who has received a Certificate of Fitness from the Owner to conduct such a test in the manner and to the pressure set forth in the code before being continued in use.
2. Licensed testers shall submit ten (10) day notice of appointments to the Owner.
3. A sworn statement by the person conducting the test, in proper affidavit form, attesting to the completion of such test, shall be filed with the Owner's office and a copy thereof posted on the premises.
4. The submission of such an affidavit or posting a copy thereof, where the required test has not been carried out in accordance with the foregoing provisions of law, shall be cause for the revocation of the Certificate of Fitness, denial of the required permits to maintain and operate equipment and may also subject the individual to criminal liability for filing a false affidavit and a fine of up to five hundred dollars, imprisonment of up to six months, or both.

SECTION 02 61 26 00 - REMOVAL AND DISPOSAL OF CONTAMINATED SOILS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for disposal of hazardous materials. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Definition

1. Hazardous materials shall be defined as asbestos containing materials, lead-based paint, PCBs, bird waste, and other materials categorized as hazardous by the EPA.

C. Submittals

1. Before start of work: At the pre-construction meeting, the Contractor shall submit the following to the Owner's Representative for review. Do not start work until these submittal are returned with Owner's Representative stamp indicating that the submittal is returned for unrestricted use.
 - a. Copy of State or local license for hazardous waste hauler.
 - b. Certificate of at least one on-site supervisor which has satisfactorily completed the OSHA 40 hour Health and Safety course for handling hazardous materials.
 - c. Certificates of workers which have successfully completed the OSHA 40-Hour Health and Safety Course for Hazardous Materials.
 - d. List of the employees scheduled to perform this work.
 - e. Schedule of start and finish times and dates for this work.
 - f. Name and address of landfill where these waste materials are to be deposited. Include contact person and telephone number.
 - g. Safety Data Sheet (SDS) for all materials to be removed.
 - h. If contractor introduces any chemical into the work environment, a SDS for that chemical must be presented to the Owner's Representative prior to use.
 - i. Transporter must have notified the EPA and/or other appropriate local government agency in advance of its intentions to transport hazardous materials and, if applicable, receive an identification number.
 - j. Contingency Plan for handling emergencies with spills or leaks.
 - k. Certificates of workers which have successfully completed the OSHA 24-Hour Health and Safety Course for Hazardous Materials.

1.2 PRODUCTS

A. Materials

1. Drums: Recovery or salvage drums acceptable for disposal of hazardous waste. Prior approval of drums is required. Drums or containers must meet the required OSHA, EPA (40 CFR Parts 264-264 and 300), and DOT Regulations (49 CFR Parts 171-178). Use of damaged containers shall not be allowed.
2. Labels: As required by the EPA and OSHA for handling, transportation, and disposal of hazardous waste.
3. Absorbent Material: Clay, soil or any commercially available absorbent used for the purpose of absorbing hazardous or potentially hazardous materials.

1.3 EXECUTION

02 - Existing Conditions

- A. All waste shall be transported and disposed of in accordance with all federal, state and local guidelines and regulations. The contractor is to obtain all permits, licenses, etc., which are necessary for the transporting and disposal of hazardous waste.
- B. Waste haulers shall maintain waste manifest and shipment record forms.

END OF SECTION 02 61 26 00

SECTION 02 65 00 00 - UNDERGROUND STORAGE TANK REMOVAL

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing of labor and equipment for the underground storage tank removal. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Work Plan: The Work Plan within 30 days after notice to proceed. The Contractor shall allow 30 days in the schedule for the Owner's review and approval. No adjustment for time or money will be made for resubmittals required as a result of noncompliance.
2. Qualifications: A document indicating that the Contractor meets the specified requirements.
3. Reports
 - a. Backfill Material.
 - b. Tank Contents Verification.
 - c. Contaminated Water Disposal.
 - d. Soil Examination, Testing, and Analysis.
 - e. Reports including the chain-of-custody records.
 - f. Backfilling.
 - g. Copies of all laboratory and field test reports.
 - h. Tank Closure Report: 3 copies of the report for each UST site opened, prepared in a standard 3-ring binder, within 14 days of completing work at each site. Each binder shall be labeled with contract number, project name, location and tank number; each binder shall be indexed. A copy of the report shall be furnished to the Installation Environmental Coordinator.
4. Records
 - a. Salvage Rights: A record of the disposition of salvaged materials at the end of the contract.
5. Qualifications
 - a. The Contractor shall have a minimum of 2 years of tank removal experience and shall be certified by the State in which the Project is located for tank removal work.
 - b. Laboratory Services: For laboratory services the Contractor shall be validated in accordance with state certification requirements.
 - c. Support Staff: The Contractor shall identify all staff involved for the various components, including personnel collecting and shipping samples. The qualifications of these staff members shall be detailed by the Contractor.

C. Regulatory Requirements

1. Permits and Licenses: The Contractor, as required or as directed by the Owner, shall obtain local, state, or federal permits and licenses that directly impact the Contractor's ability to perform the work prior to commencing removal operations.
2. Statutes and Regulations: Tank closures shall be carried out in accordance with 40 CFR 280, 40 CFR 262, 40 CFR 264, and 40 CFR 265 as well as the applicable local and State regulations. Hazardous material and/or waste shall be transported in accordance with applicable local and State regulations.

D. Project/Site Conditions: See the Detailed Scope of Work

1. Sequencing and Scheduling: The Contractor shall notify the Installation Environmental Coordinator and the Owner 5 days prior to tank removal. The Contractor shall be responsible for contacting the Implementation Agency (IA) in accordance with the applicable reporting requirements.

2. Work Plan

- a. The Contractor shall develop, implement, maintain, and supervise as part of the work, a comprehensive plan for tank removal and related operations. As a minimum the plan shall include, but not be limited to, excavation, removal, and ultimate disposal of the tank, its contents, and any contaminated materials. The Work Plan shall be based on work experience, on the requirements of this specification, and on the following references from the American Petroleum Institute:

API RP 1604.
API Standard 2015.
API RP 2003.
API Publication 2217A.
API Publication 2219.

No work at the site, with the exception of site inspections and mobilization, shall be performed until the Work Plan is approved. At a minimum, the Work Plan shall include:

- 1) Discussion of the removal approach, tank cleaning, and tank cutting procedures.
- 2) A Sampling and Analysis Plan.
- 3) Methods to be employed for product, sludge, vapor, and pumpable liquid removal; purging and inerting; and storage methods proposed for control of surface water.
- 4) Treatment options.
- 5) Identification of waste, tank and contaminated soil transporters and means of transportation.
- 6) Treatment, disposal, and alternate facilities, and means of treatment, disposal or remediation.
- 7) Borrow source.
- 8) Spill prevention plan.
- 9) Spill contingency plan.
- 10) Decontamination procedures, shoring plan, and safety measures.

1.2 PRODUCTS

A. Backfill Material

1. Backfill shall be classified in accordance with ASTM D 2487 as GW, GP, GM, GC, SW, SP, SM, SC, MH, CL, or CH and shall be free from roots and other organic matter, trash, debris, snow, ice or frozen materials. If off-site materials are used, soil classification test results shall be approved prior to bringing the material onsite. The testing frequency for backfill material shall be 1 per 1000 cubic yards or a minimum of 1 test. Non-contaminated material removed from the excavation shall be used for backfill in accordance with Paragraph BACKFILLING.

1.3 EXECUTION

A. General Requirements

1. Safety Guidelines: Personnel shall abide by the safety guidelines specified in Division 01.
2. Burning and Explosives: Use of explosives or burning debris will not be allowed.
3. Protection of Existing Structures and Utilities: The Contractor shall take all necessary precautions to avoid damage to existing structures, their appurtenances, monitoring wells, or utilities that may be affected by work activities. Any damage to utilities or monitoring wells resulting from the Contractor's operations shall be repaired at no expense to the Owner. The Contractor shall coordinate with the installation to locate underground utilities prior to beginning construction. Utilities encountered which were not previously shown or otherwise located shall not be disturbed without approval from the Owner.
4. Shoring: Shoring requirements shall be provided.

B. Tank Contents Verification

1. Sampling: Tank product, pumpable liquids, tank coatings and sludge shall be sampled by the Contractor. If the data is not adequate, additional sampling and analysis to the extent required by the approved permitted treatment, storage or disposal (TSD) facility receiving the material shall be the responsibility of the Contractor. Meeting all regulatory requirements, including the preparation of hazardous materials and waste for transportation shall be the responsibility of the Contractor.
 2. Analysis: Tank contents shall be tested by the Contractor for the parameters listed herein. Analyses shall include total petroleum hydrocarbons (TPH), benzene, ethylbenzene, toluene and xylene (BETX), and lead.
 3. Characterization: Prior to removing any of the tank contents, the contents shall be characterized to determine if the tank contents must be disposed as a hazardous or special waste or in a special manner based on local, state, and Federal disposal regulations. Tank product, pumpable liquids, and sludge shall be characterized in accordance with 40 CFR 261 and 40 CFR 279. The waste contents determination and accompanying test results for each phase present in the tank shall be submitted to the Owner. The Contractor shall be responsible for any additional requirements identified by the disposal facility. The tank contents shall not be removed until approval is given by the Owner.
- C. Clearing, Grubbing And Removals
1. Areas designated for clearing and grubbing shall be cleared of all trees, stumps, down timber, brush, rubbish, roots larger than 75 mm (3 inches) in diameter, and matted roots prior to commencing operations. Concrete or asphalt pavement shall be saw cut at the limits of removal, broken and removed with the resulting debris disposed of as directed by the Owner. Chain link fence shall be removed and salvaged for reuse or disposed of off-site, as directed by the Owner.
- D. Topsoil
1. Uncontaminated topsoil shall be stripped and stockpiled separately for reuse at a location approved by the Owner if it meets the requirements of clean fill given in Paragraph BACKFILLING. Additional topsoil in excess of that produced by excavation shall be obtained where directed by the Owner. All areas disturbed by tank removal operations, other than areas to receive pavement or similar surface under this contract, shall be topsoiled. Topsoil shall be used wherever directed by the Owner.
- E. Preparations For Excavation: Before excavating, the Contractor shall drain product piping back to the tank, remove residual liquids trapped in the product lines, and remove all product from the tank; and the tank shall be purged and vented in accordance with API RP 1604, and as specified herein.
1. Removal of Product, Pumpable Liquids, and Sludge: Tank product, pumpable liquids, and sludge shall be contained, and stored onsite, prior to disposal. Contaminated water shall be treated as specified. Tank product, pumpable liquids, and sludge shall be analyzed and segregated to recover reusable products by the Owner prior to being transported to the designated location or treatment, storage and disposal (TSD) facility. Tank product, pumpable liquids, and sludge shall be removed and disposed of by the Contractor. No Owner facilities shall be used for permanent storage or disposal of the wastes. Temporary storage on Owner's facilities will be allowed only until testing is complete, manifests (if necessary) are complete, and transportation is arranged. The Contractor shall be responsible for obtaining all required permits. Usable product shall be the property of the Contractor. The Contractor shall provide approved containers, vehicles, equipment, labor, signs, labels, placards and manifests and associated land disposal restriction notices and notifications, necessary for accomplishment of the work, including materials necessary for cleaning up spills that could occur from tank removal operations.
 2. Contaminated Water Disposal:
 - a. Sampling, Analysis, and Containment
 - 1) Contaminated water shall be sampled and analyzed both prior to and after treatment. Contaminated water produced from excavation operations and tank pumping treated onsite, shall be analyzed for pH; benzene, ethylbenzene, toluene, and xylene (BETX); total lead; oil and grease; total petroleum hydrocarbons (TPH). Sampling and analysis shall be performed prior to disposal for every 200,000 L

02 - Existing Conditions

- (50,000 gallons) of contaminated water treated. Analysis for contaminated water to be taken to an off-site treatment facility shall conform to the requirements of the treatment facility with documentation of all analyses performed furnished to the Owner in accordance with paragraph RECORDS.
- 2) Contaminated water shall be contained, stored onsite, and analyzed and disposed of by the Contractor in accordance with applicable Federal and state disposal regulations. The Contractor shall provide approved containers, vehicles, equipment, labor, signs, labels, placards and manifests and associated land disposal notices and notifications, necessary for accomplishment of the work.
 - b. Treatment: Contaminated water shall be treated by oil water separation, filtering, air stripping and activated carbon, or other means as approved by the Owner. If contaminated water is to be treated onsite, the proposed treatment shall be specified in the Work Plan and submitted for approval. Temporary storage and treatment equipment shall be installed at a location approved by the Owner. Treated effluent shall be sampled and analyzed and the results approved by the Owner before discharge to the sanitary sewer or the surface. Effluent shall be treated and discharged in accordance with the discharge permit.
- F. Purging And Inerting: After the tank and piping contents have been removed, but prior to excavation beyond the top of the tank, the Contractor shall disconnect all the piping (except the piping needed to purge or inert the tank). Flammable and toxic vapors shall be purged from the tank or the tank made inert in accordance with API RP 1604, with the exceptions that filling with water shall not be used and, if dry ice is employed, the Contractor shall use a minimum of 1.8 kg per 500 L (3 pounds per 100 gallons) of tank volume. The tank atmosphere shall be continuously monitored for combustible vapors if the tank is purged, or continuously monitored for oxygen if the tank is inerted.
- G. Excavation: Excavation areas, as well as work near roadways, shall be marked as directed by the Owner.
 1. Exploratory Trenches: Exploratory trenches shall be excavated as necessary to determine the tank location, limits and the location of ancillary equipment.
 2. Tank Excavation: Excavation around the perimeter of the tank shall be performed limiting the amount of potentially petroleum contaminated soil that could be mixed with previously uncontaminated soil. Petroleum contaminated soil shall be segregated in separate stockpiles. The Contractor shall maintain around the tank an excavation of sufficient size to allow workers ample room to complete the work, but also protect the workers from sliding or cave-ins. Sheet piling, bracing, or shoring shall be installed in the absence of adequate side slopes if there is a need for workers to enter the excavated area. Surface water shall be diverted to prevent direct entry into the excavation. Dewatering of the excavation may require a discharge permit by the State and shall be limited to allow adequate access to the tank and piping, to assure a safe excavation, and to ensure that compaction and moisture requirements are met during backfilling. Dewatering may result in the production of petroleum contaminated water and/or free product. Free product shall be recovered from the groundwater only as part of necessary dewatering.
 3. Piping Excavation: Excavation shall be performed as necessary to remove tank piping and ancillary equipment in accordance with paragraphs: Shoring, Tank Excavation, and Open Excavations.
 4. Open Excavations: Open excavations and stockpile areas shall be secured while awaiting confirmation test results from the soil beneath the tank. The excavation shall be backfilled as soon as possible after tank and contaminated soil removals have been completed and confirmation samples have been taken. The Contractor shall divert surface water around excavations to prevent water from directly entering into the excavation.
 5. Stockpiles: Uncontaminated excavated soil and petroleum contaminated soil that is not a state-regulated hazardous waste shall be stockpiled and used for backfill in the tank excavation prior to using borrow material or disposed of off-site. Excavated material that is regulated by the state as a hazardous waste shall be considered contaminated and shall be placed in containers such as drums, roll-offs or dumpsters for sampling in accordance with paragraph Stockpiled Material

Sampling. Uncontaminated soil shall be stockpiled separately from the contaminated soil, a safe distance away from, but adjacent to, the excavation.

H. Removal Of Piping, Ancillary Equipment, And Tank

1. Piping and Ancillary Equipment: All piping and ancillary equipment shall be disconnected from the tank. The piping shall be removed completely (interior and exterior of the tank). All tank ancillary equipment and piping connections shall be capped, except those connections necessary to inert the tank within the excavation zone. The piping exterior and ancillary equipment shall be cleaned to remove all soil and inspected for signs of corrosion and leakage. The Contractor shall ensure no spillage of the piping contents occurs, as specified in the Work Plan, and as required in paragraph SPILLS. If the soil under and around the tank pad is contaminated, the tank pad shall be removed and disposed of off-site at an approved non-hazardous or hazardous waste facility, as required. If the soil under and around the tank pad is not contaminated, the tank pad shall remain in place.
2. Tank: The tank shall be removed from the excavation and the exterior cleaned to remove all soil and inspected for signs of corrosion, structural damage, or leakage. All materials coming into contact with the tank, or in the vicinity of the excavation such as shovels, slings and tools shall be of the non-sparking type. After removal from the excavation, the tank shall be placed on a level surface at an approved location and secured with wood blocks to prevent movement.
3. Contaminated Soil, Tank and Piping Excavation Examination: After the tank has been removed from the ground, the adjacent and underlying soil shall be examined for any evidence of leakage. The soil shall be visually inspected for staining after removal of all obviously contaminated soil, then screened for the presence of volatile and/or semi-volatile contamination using a real time vapor monitoring instrument or immunoassay field kits, as required. Uncontaminated soil or petroleum contaminated soil not regulated by the state as hazardous waste shall be transported off-site for disposal. Contaminated soil or suspected contaminated soil shall be containerized. the Owner shall determine the extent of the contaminated soil to be removed from each site. The Contractor shall report any evidence indicating that the amount of contaminated soil may exceed the individual site limit specified, to the Owner the same day it is discovered. If minimal additional excavation is required, the Owner may allow the Contractor to proceed. If extensive contamination is encountered, the excavation shall be sampled and backfilled in accordance with paragraph BACKFILLING. After the known contaminated soil is removed, the excavation shall be sampled and analyzed.

I. Tank Cleaning

1. Exterior: Soil shall be removed from the exterior of the tank, piping, and associated equipment to eliminate soil deposition on roadways during transportation to a temporary storage area, ensure markings will adhere to the surfaces, and simplify tank cutting. Soil shall be removed using non-sparking tools. Removed uncontaminated soil and soil not regulated by the state as a hazardous waste shall be recovered and used as backfill in the former tank excavation. Soil believed to be contaminated shall be removed and containerized.
2. Temporary Storage: If the tank is stored after the tank exterior is cleaned and ancillary equipment is removed, and prior to being cut into sections, the tank shall be labeled as directed in API RP 1604, placed on blocks, and temporarily stored in the area of the existing tank site. Prior to cleaning the tank interior the tank atmosphere shall be monitored for combustible vapors and purged or inerted if combustible vapors are detected.
3. Interior:
 - a. The tank interior shall be cleaned using a high pressure (greater than 500 psi (3.45 Mpa)), low volume (less than 2 gpm (0.13 L/s)) water spray or steam cleaned until all loose scale and sludge is removed, and contamination, in the form of a sheen, is no longer visible in the effluent stream. The interior surfaces of piping shall also be cleaned, to the extent possible, using the same method used for cleaning the tank. Contaminated water generated from interior cleaning operations (of both piping and tank) shall not exceed the following quantities for each UST cleaned:

UST VOLUME (LITERS)

PERCENT OF UST VOLUME

3,785 or less	5
37,850 or less	5 or 378 L, whichever is less
75,700 or less	1 or 568 L, whichever is less
greater than 75,700	1 or 946 L, whichever is less

UST VOLUME (GALLONS)	PERCENT OF UST VOLUME
1,000 or less	5
10,000 or less	5 or 100 gal., whichever is less
20,000 or less	1 or 150 gal., whichever is less
greater than 20,000	1 or 250 gal., whichever is less.

b. All contaminated water resulting from cleaning operations shall be handled in accordance with paragraph Contaminated Water Disposal. Cleaning shall be accomplished eliminating, to the greatest extent possible, the need for personnel to enter the tank. Cleaning shall be done using specially designed tank cleaning equipment which allows the tank to be cleaned prior to cutting into sections without requiring personnel to enter the tank or, if less specialized equipment is used, the tank shall be partially dissected to overcome confined space entry hazards.

J. Soil Examination, Testing, And Analysis

1. Tank Excavation Sampling Procedures: After soil known to be contaminated has been removed or after soil excavation is complete, the excavation shall be sampled with procedures, number, location, and methodology in accordance with state regulations. Samples shall be obtained from the pits, in accordance with ASTM D 1587, using a backhoe with a Shelby tube attached to the bucket.
2. Stockpiled Material Sampling: Sampling locations, number and specific procedures shall be as required by the implementing agency and the disposal facility.
3. Analysis: Soil samples from the excavation and stockpiled material shall be tested in accordance with the approved Sampling and Analysis Plan for the following parameters: total petroleum hydrocarbon (TPH); benzene, ethylbenzene, toluene, xylene (BETX); toxicity characteristic leaching procedure (TCLP). Copies of all test results shall be provided to the Owner.

K. Backfilling: The tank area and any other excavations shall be backfilled only after the soil test results have been approved. Contaminated soil removal shall be complete after the bottom of the tank excavation is determined to have soil contamination levels below the state standards of approval by the Owner. The excavation shall be dewatered if necessary. Stockpiled material subjected to chemical confirmation testing shall be used as backfill if it is found to conform to the requirements of clean fill per appropriate state and local regulations. Backfill consisting of clean fill shall be placed in layers with a maximum loose thickness of 200 mm (8 inches) and compacted to 90 percent maximum density for cohesive soils and 95 percent maximum density for cohesionless soils. Density tests shall be performed by an approved commercial testing laboratory or by facilities furnished by the Contractor. Test results shall be attached to contractor's Quality Control Report. A minimum of 1 density test shall be performed on each lift. Laboratory tests for moisture density relations shall be determined in accordance with ASTM D 1557, Method B, C, or D, or ASTM D 3017. A mechanical tamper may be used provided that the results are correlated with those obtained by the hand tamper. Field in-place density shall be determined in accordance with ASTM D 1556, ASTM D 2922, or ASTM D 2167.

L. Disposal Requirements

1. Treatment, Disposal, and Recycling: Disposal of hazardous or special wastes shall be in accordance with all local, State, and Federal solid and hazardous waste laws and regulations; and conditions specified herein. This work shall include all necessary personnel, labor, transportation, packaging, detailed analyses (if required for disposal, manifesting or completing waste profile sheets), equipment, and reports. Product and pumpable liquids removed from the tank shall be recycled to the greatest extent practicable. The tanks removed shall be disposed of

- at one of the state approved facilities. Each tank disposed of in this manner shall be manifested as required by the State to document delivery and acceptance at the disposal facility.
2. Tank and Ancillary Equipment Disposal: After the tank, piping, and ancillary equipment have been removed from the excavation and the tank cleaned, the tank shall be cut into sections with no dimension greater than 1500 mm (5 feet). Tank and piping sections shall be disposed of in a State approved off-site disposal facility or in a salvage yard. The tank shall be cut into sections prior to being taken from the tank removal site. The Contractor shall not sell the tank intact. Ancillary equipment shall be disposed of at an approved off-site disposal facility or a salvage yard. Piping shall be disconnected from the tank and removed or grouted full of a portland cement and water slurry consisting of 22.7 L (6 gallons) of clean water per 42.6 kg (94 pound) sack of portland cement, thoroughly mixed and free of lumps, unless otherwise indicated.
 3. Transportation of Wastes: Transportation shall be provided in accordance with Department of Transportation (DOT) Hazardous Material Regulations and State and local requirements, including obtaining all necessary permits, licenses, and approvals. Evidence that a State licensed hazardous waste or waste transporter is being used shall be included in the SUBMITTALS.
 4. Salvage Rights: The Contractor shall retain the rights to salvage value of recycled or reclaimed product and metal not otherwise identified, so long as the requirements of 40 CFR 266 and 40 CFR 279, or the applicable State requirements are met. At the end of the contract, the Contractor shall provide documentation on the disposition of salvaged materials.
 5. Records: Records shall be maintained of all waste determinations, including appropriate results of analyses performed, substances and sample location, the time of collection, and other pertinent data as required by 40 CFR 280, Section 74 and 40 CFR 262 Subpart D. Transportation, treatment, disposal methods and dates, the quantities of waste, the names and addresses of each transporter and the disposal or reclamation facility, shall also be recorded and available for inspection, as well as copies of the following documents:
 - a. Manifests.
 - b. Waste analyses or waste profile sheets.
 - c. Certifications of final treatment/disposal signed by the responsible disposal facility official.
 - d. Land disposal notification records required under 40 CFR 268 for hazardous wastes.
 6. Hazardous/Special Waste Manifests: Manifesting shall conform to Federal, State and local requirements.
 7. Documentation of Treatment or Disposal: The wastes, other than recyclable or reclaimable product or metal, shall be taken to a treatment, storage, or disposal facility which has EPA or appropriate state permits and hazardous or special waste identification numbers and complies with the provisions of the disposal regulations. Documentation of acceptance of special waste by a facility legally permitted to treat or dispose of those materials shall be furnished to the Owner not later than 5 working days following the delivery of those materials to the facility; and a copy shall be included in the Tank Closure Report. A statement of agreement from the proposed treatment, storage or disposal facility and certified transporters to accept hazardous or special wastes shall be furnished to the Owner not less than 14 days before transporting any wastes. If the Contractor selects a different facility than is identified in the contract, documentation shall be provided for approval to certify that the facility is authorized and meets the standards specified in 40 CFR 264.
- M. Spills: Immediate containment actions shall be taken as necessary to minimize effect of any spill or leak. Cleanup shall be in accordance with applicable Federal, State, local laws and regulations, and district policy at no additional cost to the Owner.
- N. Tank Closure Report: Tank Closure Reports shall include the following information as a minimum:
1. A cover letter signed by a Professional Engineer registered in the State in which the Project is located certifying that all services involved have been performed in accordance with the terms and conditions of this specification.
 2. A narrative report describing what was encountered at each site, including:
 - a. condition of the UST.
 - b. any visible evidence of leaks or stained soils.
 - c. results of vapor monitoring readings.

- d. actions taken including quantities of materials treated or removed.
 - e. reasons for selecting sample locations.
 - f. sample locations.
 - g. collection data such as time of collection and method of preservation.
 - h. reasons for backfilling site.
 - i. whether or not groundwater was encountered.
- 3. Copies of all analyses performed for disposal.
 - 4. Copies of all waste analyses or waste profile sheets.
 - 5. Copies of all certifications of final disposal signed by the responsible disposal installation official.
 - 6. Information on who sampled, analyzed, transported, and accepted all wastes encountered, including copies of manifests, waste profile sheets, land disposal restriction, notification and certification forms, certificates of disposal, and other pertinent documentation.
 - 7. Copies of all analyses performed for confirmation that underlying soil is not contaminated, with copies of chain-of-custody for each sample. Analyses shall give the identification number of the sample used. Sample identification numbers shall correspond to those provided on the one-line drawings.
 - 8. Scaled one-line drawings showing tank locations, limits of excavation, limits of contamination, underground utilities within 15 m (50 feet) sample locations, and sample identification numbers.
 - 9. Progress Photographs. The Contractor shall take a minimum of 4 views of the site showing such things as the location of each tank, entrance/exit road, and any other notable site condition before work begins. After work has been started at the site, the Contractor shall photographically record activities at each work location daily. Photographs shall be 76.2 x 127.0 mm (3 x 5 inches) and shall include:
 - a. Soil removal, handling, and sampling.
 - b. Unanticipated events such as discovery of additional contaminated areas.
 - c. Soil stockpile area.
 - d. Tank.
 - e. Site or task-specific employee respiratory and personal protection.
 - f. Fill placement and grading.
 - g. Post-construction photographs. After completion of work at each site, the Contractor shall take a minimum of four (4) views of the site. Prints shall illustrate the condition and location of work and the state of progress. The photographs shall be mounted and enclosed back-to-back in a double face plastic sleeve punched to fit standard three ring binders. Each color print shall show an information box, 40 x 90 mm (1-1/2 x 3-1/2 inches). The information box for the 76.2 x 127.0 mm (3 x 5 inch) photographs shall be scaled down accordingly, or taped to the bottom of the photo. The box shall be typewritten and arranged as follows:
 - Project No.
 - Contract No.
 - Location
 - Contractor/Photographer
 - Photograph No. Date/Time:
 - Description
 - Direction of View

END OF SECTION 02 65 00 00

Task	Specification	Specification Description
02 65 00 00	02 41 13 13a	Selective Demolition

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 82 00 00 - ASBESTOS ABATEMENT AND IN-PLACE MANAGEMENT

PART I - GENERAL

1.01 DESCRIPTION

- A. The safe abatement and in-place management of asbestos containing materials (ACM) and presumed asbestos containing materials (PACM) at the A/C (**INSERT AC PROJECT TITLE AND CONTRACT TITLE**), is the primary purpose of this specification. The contract provisions are designed to protect University community members from exposure as a result of work being performed by the Contractor.

1.02 SCOPE OF WORK

A. Work Included – General

1. The Contractor shall furnish all labor, materials, equipment, services, testing, employee training, fit tests, medical exams, transportation, insurance, and daily expense to meet the requirements of this specification.
2. The Contractor shall obtain all required permits, licenses, registrations, and notifications, and regulatory approvals required by law and UCDCM policy.
3. All asbestos abatement activities associated with this contract shall be performed between the hours of **7:00 AM to 5:00 PM** (**EDIT HOURS**) unless coordinated with the University's Representative. (**THIS MUST MATCH 3.05A**)
4. The Contractor shall guard against unnecessary disturbances or damage to sensitive finishes on buildings, building systems, and equipment.
5. Any job with more than one class designation (see T8 CCR 1529) shall be performed at the higher standard. For example, a contract let for class II and class III work will be performed at the class II level.

B. Work Included – Specific

1. **** SCOPE -- Provide a description of the overall scope of asbestos related work ** OR NOT USED.** The Contractor is responsible for identifying the exact locations and number of work areas listed below by referring to University supplied project drawings and by working with the University's Representative.
2. The *(Name of Project and Building)* has been tested for asbestos containing materials by various independent asbestos consultants. Asbestos materials have been identified in the project area and may be impacted by the planned project. See Section 1.03 Site Characterization and the table identifying the different asbestos materials present in the project area.
3. **Asbestos Abatement Overview – (Asbestos Consultant to insert specific overview of project here).** (The following can be used for the N/S and East Wings)--*This project may include removal of asbestos containing fireproofing materials in spot locations for seismic support and other attachments. In the North/South Wing and East Wing, there is asbestos containing fireproofing present on the underside of the roof deck with considerable amount of fireproofing debris on top of the plaster ceiling system and within*

the interstitial cavities between all plaster walls. Due to the asbestos contamination assumed to be present on top of plaster ceilings and assumed to be present within the open top plaster wall cavities, all wall and ceiling materials within the North/South Wing and East Wing are considered as asbestos containing materials. In addition, all ducts, insulation, electrical wiring, piping, conduit, electrical wiring, etc., located in the attic space and wall cavities are considered contaminated with asbestos.

4. *The project may include access into the attic space to conduct the work required. Small amounts of the fireproofing might required to be removed for anchoring seismic braces and other attachments. This project will require a licensed asbestos contractor registered with DOSH to perform removal of all selected asbestos containing materials and asbestos contaminated materials within work environments in accordance with Title 8 1529 Asbestos in Construction in order to accomplish the tasks.*
5. *It is anticipated work might be required in asbestos contaminated attic spaces by other non-asbestos abatement trade workers, including but not limited to, electricians, plumbers and other trades. This will require trades that are trained in asbestos and respiratory protection to work in asbestos contaminated work environments to perform this work.*
6. *In-Place Management of Asbestos - **SCOPE** OR NOT USED Provide a description of the overall scope of asbestos related work Asbestos materials will be left in place on this project that will include the fireproofing, wall plaster systems that are known to have asbestos debris within the cavities, many plaster ceilings with asbestos containing fireproofing debris throughout the attic spaces that will not be cleaned. All work in the attic space above the ceiling system of the North/South Wing and East Wing is considered asbestos contaminated. All asbestos related controls, asbestos training, worker protection, air sampling, decontamination, engineering controls, and other control measures apply for all contractor employees who are required to enter the attic space or who work in areas with asbestos containing materials.*
7. *Work practices and procedures for asbestos removal are provided in these specifications.*
8. *The asbestos contractor will be responsible for replacement of the fireproofing materials in the same locations removed following the attachment to the exposed sections of structure by the other trades. The new fireproofing materials shall be hand packed by the asbestos contractor. See other specifications regarding materials, execution and performances for this required work.*
9. *The asbestos contractor will be responsible for soft demolition of items from the work area to minimize potential disturbance to asbestos materials.*

1.03 SITE CHARACTERIZATION

- A. *An asbestos inspection was conducted by the University or the University's Representative's Hazardous Materials Consultant who is a California Certified Asbestos Consultant. Materials found or presumed to contain asbestos at this job site are listed in the table below. The table below does not suggest all of the materials are to be removed. It is provided to inform the contractor on all asbestos containing materials that have been identified in the project area that the contractor will be working near and around during execution of the project. (The table needs to be filled out for the specific project. The following table can be used for the North/South Wing*

and East Wing, while other projects will need to have the table populated with pertinent information based on the asbestos inspection report specific to the project).

Asbestos Containing Materials in North/South Wing and East Wing					
<i>Building Description</i>	<i>System</i>	<i>NESHAP Class</i>	<i>Cal/OSHA Class I, II, or III</i>	<i>% of Asbestos</i>	<i>Location</i>
Fireproofing		RACM	I	10	See Drawings
Pipe Insulation		RACM	I	20	See Drawings
Drywall and Joint Compound		RACM	I	Assumed > 1%	See Drawings
Wall Plaster Cavities		RACM	I	Assumed > 1%	See Drawings
Ceiling Plaster Spaces		RACM	I	Assumed > 1%	See Drawings
Duct Insulation in attic and chases contaminated		RACM	I	Assumed > 1%	See Drawings
Electrical Wiring contaminated		Cat II	II	Assumed > 1%	See Drawings
Piping and Conduit in attic and wall spaces contaminated		Cat II	II	Assumed > 1%	See Drawings
9" or 12" Floor Tiles & Mastic		Cat I	II	Assumed > 1% for Tiles and Mastic	See Drawings
Roofing Material and Roof Mastic		Cat I	II	Assumed > 1%	See Drawings
Transite Pipes		Cat II	II	Assumed > 1%	See Drawings
Transite Material Sandwiched between Metal Ventilator Units		Cat II	II	Assumed > 1%	See Drawings

1. Asbestos inspection reports including asbestos laboratory reports with results by polarized light microscopy (PLM) are available to the Contractor by contacting the University's Representative.

B. Non-asbestos containing materials have been identified and sampled for this project. The table below includes a list of materials sampled and found not to contain asbestos. If the Contractor discovers building materials on the project not included in either Table A (Asbestos Containing List) or Table B (Non-asbestos Containing List) the Contractor shall bring this to the attention of

the Project Manager, which may result in asbestos sampling by the University's Certified Asbestos Consultant.

Building Materials Sampled and Found Not to Contain Asbestos	
Material Description	Location

C. Hazardous materials, other than ACM/PACM that have the potential to be disturbed at this job site are listed in the table below:

Material Description	Type of Hazard	Quantity (approx.)
Fluorescent Light Bulbs	Mercury	See Drawings
Light Ballasts	PCB's	See Drawings
Light Ballasts	Universal Waste	See Drawings
Mold Contamination	Mold	Undetermined
Thermostat Switches	Mercury	See Drawings
Exit Signs	Radioactive Gas Tritium	See Drawings
Painted Surfaces & Ceramic Products	Lead in Paint and Glaze	See 13281

1. The Contractor shall review non-asbestos hazardous material required protocols with the University's Representative and the EH&S Representative. Lead related work will be addressed in Section 13281 specifications, if applicable.

1.04 JOB WALK PROTOCOL

- A. No special provisions are required on the job walk to review the asbestos materials, since there are no areas of known asbestos contamination on this project.
- B. (For contaminated work areas) The pre-bid walk will include the inspection of contaminated areas cited in 1.02.A or 1.02.B. All bidders are required to wear respirators and protective clothing per CCR, Title 8 1529. Prior to entering contaminated areas, the bidder must show proof of (1)

AHERA or asbestos awareness training and (2) a respirator fit test within the past 12 months.
****CHECK THIS PARAGRAPH - PLAN PRE-BID MEETING TO MATCH****

- C. For access into attic spaces in project areas identified with known asbestos containing fireproofing materials, a controlled access will be required by Contractors who desire to look or inspect the attic spaces. Access will require a controlled mini-enclosure to minimize potential asbestos contamination into the space below the ceiling system.
- D. Short Duration Access into the Attic Space (30 minutes/day) – Mini-enclosure
 - 1. Entry protocols - Put on respirator, perform negative pressure and positive pressure fit tests. Put on a disposable coverall (over street clothes) and enter the mini-enclosure to view the contaminated space from a ladder.
 - 2. Exit protocol - Take off the disposable coverall and place into the asbestos waste bag located inside of the mini-enclosure. Wet wipe exposed skin with wet wipes or wet clean clothes and place into waste bag. While still wearing the respirator exit the mini-enclosure. Remove the respirator outside of the mini-enclosure and tape opening to respirator filters. Wet wipe the respirator, hands and face, and place wet wipes into waste bag.
- E. Long Duration Access (>30 minutes/day) -
 - 1. Not Available unless by special request.

1.05 ABBREVIATIONS AND DEFINITIONS

- A. Abbreviations
 - 1. ACM: Asbestos Containing Material
 - 2. AHERA: Asbestos Hazard Emergency Response Act
 - 3. CARB: California Air Resources Board
 - 4. CSLB: Contractor's State Licensing Board
 - 5. CDPH: California Department of Public Health
 - 6. DOP: Dispersed Oil Particulate
 - 7. DOSH: Division of Occupational Safety and Health (Cal/OSHA)
 - 8. ELAP: Environmental Laboratory Accreditation Program
 - 9. EH&S: UC DMC Department of Environmental Health & Safety
 - 10. NEA: Negative Exposure Assessment
 - 11. NPE: Negative Pressure Enclosure
 - 12. NVLAP: National Voluntary Laboratory Accreditation Program
 - 13. PACM: Presumed Asbestos Containing Material
 - 14. RACM: Regulated Asbestos Containing Material
 - 15. TSI: Thermal System Insulation
 - 16. University or University of California Davis Medical Center (UCDMC), or Owner shall be considered the same entity when used in these specifications.
- B. Definitions: The following definitions are provided for additional clarification to the California Code of Regulations (CCR), Title 8, 1529 and the Sacramento Metropolitan Air Quality Management District (SMAQMD) Rule 902.
 - 1. ACM and PACM are defined in 8 CCR 1529; which includes friable and non-friable

02 - Existing Conditions

- asbestos. These regulations include the use of worker protection, negative pressure enclosures (NPE), air monitoring, etc.
2. Ambient Air Quality refers to the quality of local air conditions prior to the commencement of asbestos related work.
 3. Per T8 CCR 1529, Class I asbestos work involves the removal (abatement) of TSI or Surfacing material when (1) more than one glove bag is used or (2) removal of TSI or Surfacing material consisting of more than one 60" X 60" waste bag.
 4. Per T8 CCR 1529, Class II asbestos work involves the removal (abatement) of non-TSI or non-surfacing material if the work is not repair or maintenance as defined by Class III. Examples of Class II work include removal of floor tile, floor mastics, gypsum wallboard with joint compound, roofing and siding shingles, construction mastics, etc.
 5. Per T8 CCR 1529, Class III asbestos work involves repair and maintenance of friable ACM/PACM that is either TSI or Surfacing materials, but does not exceed the removal of ACM/PACM that exceeds either one glove bag or one 60" x 60" disposal waste bag.
 6. Per T8 CCR 1529, Class IV asbestos work refers to contact but no disturbance of ACM/PACM. Class IV work refers to clean-up operations of Class I, II, or III projects. Class IV work does not refer to incidental contact by maintenance workers (see 8 CCR 5208 for custodial/maintenance workers guidelines).
 7. Negative Pressure Enclosure (NPE) refers to full containment and mini-containments under negative pressure with HEPA filtered exhaust.

1.06 SUBMITTALS

- A. The submittals listed in 1.06 B must be completed and accepted by the University's Representative with the concurrence of the EH&S Representative prior to the contractor beginning any work.
- B. List of Submittals:
 1. References to include three projects of similar scope and size.
 2. Notifications to Cal/OSHA and Sacramento Metropolitan AQMD (if applicable).
 3. Permits if applicable (federal, state, local, or UC DMC).
 4. Current certificates of AHERA Asbestos Training for Workers and Supervisors. See Section 3.07.
 5. Copies of all asbestos training and respiratory training for various Trade workers who will be working in the contaminated work spaces. See Section 3.07.
 6. Current respiratory fit test records (within past 12 months) for all workers required to wear a respirator.
 7. Physician's certificates of medical fitness for respiratory use for all workers wearing a respirator and medical evaluation for asbestos related work (within 12 months) for all asbestos abatement workers.
 8. DOSH Registration for asbestos related work.
 9. DOP certificates for all HEPA vacuums and negative air machines, which are required to be tested onsite and witnessed by UC DHS EH&S or the University's Asbestos Consultant. Submit after equipment has arrived on campus and has been tested. Provide information of the company providing the DOP challenge testing of the HEPA filter

- systems showing proficiency in the testing. Include evidence of the training of personnel conducting the challenge testing.
10. List of HEPA vacuums and negative air machines to be used on the project (mfg. model and serial numbers).
 11. Safety Data Sheets for all products used at the job site.
 12. List all laboratories used by Contractor for air or bulk samples. Provide proof of current AIHA Proficiency Analytical Testing (PAT) Program with passing scores.
 13. California Contractor's License C22 for asbestos.
 14. Waste Disposal Plan including name of disposal site, waste transporter, and waste transporter certification.
 15. Substitute Materials Information (for any material not listed in 2.01).
 16. General liability insurance certificate with Owner and asbestos consultant named as additional insured.
 17. Auto insurance certificate.
 18. Workers Compensation Insurance certificate.
 19. Written work plan including schedule, emergency plans, route of waste transport from project site to waste bin.
 20. Manufacturer's documentation of 5.0 micron filter that shall be used for filtration of all water from the shower and other asbestos related work.

1.07 CONTRACTOR QUALIFICATIONS

- A. The contractor performing asbestos abatement work shall be currently licensed as an Asbestos Contractor (C22) with the California Contractor's Licensing Board.
- B. The contractor performing asbestos abatement work shall be currently registered for asbestos with the California Department of Industrial Relations, Division of Occupational Safety and Health (DOSH).
- C. The contractor's personnel performing asbestos abatement work shall meet the following training requirements:
 1. Class I and II Asbestos Work: Supervisors and Workers must be AHERA trained and shall have current refresher training certificates for asbestos related work.
 2. Class III Asbestos Work: Supervisors and Workers shall have received at least 16 hours of asbestos training. Depending upon the work trade such as electricians, plumbers, carpenters, etc., the number of hours of asbestos training may be less than 16 hours, if these trades are not involved in asbestos removal activity. Trade work involving this class of workers may only require a minimum of 6-8 hours of asbestos training for Class III work where they are working in asbestos contaminated work spaces, drilling holes in materials containing asbestos for conduit or pipe installation, attaching to building surfaces conduit, or other minor disturbance to asbestos materials, but not involved in actual removal of asbestos. (The following only applies to the N/S Wing and East Wing if applicable) Work in the asbestos contaminated attic spaces of the North/South Wing and East Wing is one example of Class III work where workers will require asbestos training with emphasis on decontamination procedures and respiratory protection. Removal of small amounts of asbestos such as fireproofing for attachment of hangers for electrical, plumbing or other utilities would require a higher level of training (Class I). All class I work

02 - Existing Conditions

- shall be performed by a licensed asbestos contractor.
3. Class IV: Supervisor must be AHERA trained. Workers must have a minimum of “asbestos awareness” level training.

1.08 REGULATIONS

- A. The contractor performing asbestos abatement work shall comply with applicable federal, state, local, and University laws and regulations. The list of regulators and regulations, cited below, is not meant to be comprehensive, but to serve as reference for the most commonly used standards:
 1. FEDERAL
 - a. EPA
 - 1) 40 CFR, Part 763, Subpart E – AHERA
 - b. OSHA
 - 1) 29 CFR 1926.1101 - Construction Standard
 - 2) 29 CFR 1910.1001 - General Industry Standard
 - 3) 29 CFR 1910.147 - Lock Out - Tag Out
 - c. NESHAP
 - 1) 40 CFR 61, Subpart M - Asbestos Emissions
 - 2) 40 CFR 61, Subpart A
 - d. DOT - Regulations
 2. STATE
 - a. Cal/OSHA
 - 1) CCR, Title 8, Section 1529 – Asbestos Construction Standard
 - 2) CCR, Title 8, Section 3203 - Injury Illness Prevention
 - 3) CCR, Title 8, Section 5194 - Hazard Communication
 - 4) CCR, Title 8, Section 5157 - Confined Space
 - 5) CCR, Title 8, Section 5208 - General Industry Standard
 - 6) CCR, Title 8, Section 5144 – Respiratory Protection Standard
 3. LOCAL
 - a. Sacramento Metropolitan Air Quality Management District (SMAQMD)
 - 1) Rule 902
 4. UC DMC
 - a. Policy and Procedures

1.09 NOTIFICATION AND PERMITS

- A. Contractor is responsible for notifying federal, state, local agencies, obtaining all required permits/extensions, and bearing all related costs. Contractor shall provide a copy of all notifications and permits to the UCDCM Representative prior to the start of the work and during the project if additional notifications or permits are obtained.
- B. UCDCM
 - 1. Hot or Hazardous Material Permit (Call the UCDCM Fire Department at 916-734-3060 for instructions).
 - 2. EH&S Waste Manifest Protocols (Call EH&S Representative, at 916-734-2740 for instructions). Only EH&S staff will be allowed to sign Waste Manifests.
- C. Sacramento Metropolitan Air Quality Management District
 - 1. Provide ten (10) days notification to Sacramento Metropolitan Air Quality Management District (SMAQMD) for any demolition or renovation job with RACM, or materials that will become RACM which exceeds a combined amount of 260 linear feet, 160 square feet or 35 cubic feet.
- D. NESHAP
 - 1. The US EPA NESHAP does have jurisdiction on UCDCM projects located outside of Sacramento County; therefore, notification to NESHAP and CARB is required on projects outside of Sacramento County.
- E. CAL/OSHA
 - 1. Only DOSH registered contractors are permitted to perform class I, II, and III work at UCDCM where removal of asbestos is required. Contractor trades such as electricians, carpenters, plumbers, etc., who have received Class III asbestos training due to the potential for disturbance of asbestos materials are not required to be registered with Cal/OSHA if they are not removing asbestos materials. Drilling holes or attachments to building surfaces that might contain asbestos (such as gypsum wallboard or plaster systems) or accessing an asbestos contaminated work area for example is not considered asbestos removal. Removal of small amounts of fireproofing for attachment and support hangers (if required for the project) shall be performed by a licensed asbestos contractor. Contractor shall provide written notification to the local Cal/OSHA office 24 hours prior to the start of work.

1.10 UNIVERSITY CONTACTS

- A. University's Representative: ****FD&C PROJECT MANAGER****
Phone: 916-734-PPPP
FAX: 916-734-7751
- B. EH&S Representative: Kaila Benton-Vitz
Phone: 916-734-2740
FAX: 916-734-7360

02 - Existing Conditions

- C. University's Representative's Asbestos Consultant: **(Name)**
Phone:
FAX:

PART II - MATERIALS AND EQUIPMENT

2.01 MATERIALS

- A. Safety Data Sheets (SDS)
1. As specified in the Cal/OSHA Hazard Communication standard (Title 8 5194), the Contractor shall provide safety data sheets (SDS) for all products they use on UCDCM campus. The SDS files shall be submitted prior to the start of the project and shall be located in or near the job site entrance.
- B. Surfactants
1. Contractor may use Foster 32-90, Certane 2075, or equal, for amended water applications. The Foster product is manufactured by H.B. Fuller Co., Foster Products Corporation, Oakdale, MN. The Certane product is manufactured by Certech, Eden Prairie, MN.
- C. Encapsulants
1. The following products or their equals are to be applied using a brush, roller or an airless sprayer, when an encapsulant is required on the project. Contractor shall follow strict manufacturer instructions regarding surface preparation, ambient air retractions, depth of penetration or recommended thickness (dry), and curing time.
 - a. For penetrating & lockdown purposes use Foster 32-60 or Certane 909, or equal.
 - b. For bridging purposes use Foster 32-32 or Certane 2000, or equal.
 - c. For high temperature applications, e.g., steam pipes, use Foster 84-18 or Certane 1000, or equal.
 2. Any proposed equal to the products listed above must meet the following criteria: Submit product information prior to the start of the job and receive approval by the University's Representative with the concurrence of the EH&S Representative; non-toxic and non-irritating as defined by the Hazardous Substance Control Act; sufficiently tinted to provide contrast with the material being coated; and have a minimum 60 lbs./inch Batelle Standard impact rating.
 3. All products will be rated UL Class A and have a flame resistance/spread rate less than or equal to 25 as designated by the ASTM code E 162.
- D. Polyethylene Bags and Sheeting
1. Bags and sheeting used for capturing asbestos waste are required to be (1) six mil thick and (2) meet the following standards: UL Standard No. 263, ASTM E-84, NFPA Standard

- 701 & 255; and have a flame resistance/spread rate less than or equal to 25 ASTM (E-162).
2. Startex Corp.(Lakeville, MN), North Plastics (Cottage Grove, MN) Bermis Co. (Terre Haute, IN) provide acceptable bags and sheeting. If an equal is proposed, comply with the provisions in 2.1 C 2 above.
3. The contractor will ensure all asbestos waste is properly labeled per Cal EPA, DOT, Cal/OSHA, and EH&S standards prior to disposal.

E. Adhesive Removers

1. All adhesive removers shall meet the Hazardous Substance Control Act standards for non-toxic, low odor, and non-irritating properties.
2. All adhesive removers shall be (a) non-flammable and (b) contain less than 1% (by volume) of any chlorinated hydrocarbon solvents.
3. Whenever possible, adhesive removers shall be mixed into a slurry/paste using diatomaceous earth to control migration through the substrate. This requirement especially applies where there are existing building spaces below the project area.

2.02 EQUIPMENT

- A. All HEPA filtered vacuums and HEPA filtered negative air machines shall pass a leak (challenge) test on-site by a firm independent of the contractor before they are allowed to be used on the project. The challenge testing must be witnessed by the UCDHS EH&S or the University's Representative Asbestos Consultant.
- B. Tools and equipment shall arrive at the job site free of significant visible debris and dust. No ACM debris shall be allowed to be brought onto the site at any time. All vacuum ports and other openings to negative air units shall be sealed when the units arrive on the project site and sealed when they leave the project site. The Owner or Owners' Representative reserves the right to reject any equipment brought onsite by the asbestos contractor that is deemed contaminated with suspect asbestos materials from a prior project.
- C. All electric tools and equipment shall be connected to a GFCI when in use.

PART III - EXECUTION

3.01 SAFETY MEETING

- A. In accordance with State and Federal laws, the Contractor is responsible for conditions of the project site, including the safety of all persons and property during the performance of the work. To ensure effective communications in safety matters, the Contractor shall participate and conduct the following meetings:
 1. Pre-construction safety meetings may include representatives from the following groups: FD&C, Infection Prevention, EH&S, affected building occupants, general contractor, asbestos subcontractors (if applicable), and the UCDCM Hazardous Materials Representative. The following subjects will be discussed: impact to building occupants, waste disposal, ICRA Permit and compliance, and work related safety programs.
 2. On the first day of work, Contractor shall conduct a safety meeting for its employees

02 - Existing Conditions

which alerts them to the specific hazards of the job. The Contractor shall conduct the safety meetings in primary language of its employees.

3. Contractor shall conduct a safety meetings with its employees during the course of the project to discuss health and safety issues related to the project.

3.02 WORK SITE PREPARATION

- A. Prior to beginning any on-site work preparation, Contractor shall walk the job area with the UCDMC Project Manager and with the UCDMC Representative Asbestos Consultant to discuss site characterization, ICRA Permit and compliance, regulated area set-up, access controls, security, and safety issues. The contractor is responsible for providing locks and security to the project site to prevent the public and other hospital staff from entering the project area during work hours and during off work hours.
- B. Post all regulatory notices, permits, sign in/out roster at the primary entrance to the job site.
- C. Contractor, in coordination with the University's PO&M, shall ensure all electrical and HVAC equipment servicing the work area is disconnected and locked out, when possible. Electrical tools in the work zone shall be connected to a ground-fault circuit interrupter (GFCI).
- D. The contractor shall seal air tight all HVAC supply and return registers, exhaust registers and other critical openings with tape, double layers of plastic and cardboard or plywood inserts as necessary.
- E. Contractor shall ensure all negative air machines and HEPA vacuums are delivered to the site clean and sealed.
- F. Contractor shall ensure all HEPA filtration units are challenge leak tested on site and witnessed by EH&S or UCDMC Asbestos Consultant. Each piece of equipment shall be tested in compliance with the ANSI Z9.9 Standard (trapping and retaining 99.97% of all particles challenged with 0.3 micron diameter particles). The asbestos contractor shall provide copies of the challenge tests for all HEPA filtered systems showing proof of passing the challenge test. All HEPA filtered systems shall have a sticker applied to the surface showing passage of the challenge test. The company performing the challenge test procedure shall show evidence of proficiency and training in the test procedure that will be used.
- G. In order for the UCDMC Project Manager to conduct timely inspections, Contractor is obligated to inform the UCDMC Project Manager and the UCDMC Representative Asbestos Consultant when they are ready to be inspected at least 24 hours prior to the requested inspection.
- H. All Cal/OSHA Class I, II, and III asbestos work shall be conducted within a regulated area per 8 CCR 1529.
- I. Temporary anterooms shall be erected at entrance/exist areas from the construction work. The anterooms shall be sized to accommodate equipment and materials being introduced and waste materials being removed from the construction work area. The plastic separation walls shall be constructed with zippered doors at the entry points. At least one recording manometer shall be installed at the entrance to the anteroom to monitor the negative pressure within the construction work area.

- J. Where there is work in the attic space, loss of negative pressure will occur when the ceiling system is opened up. To meet the requirement for -0.020" water column negative pressure within the anteroom compared to the surrounding non-construction work area, the following configuration is required when access into the attic space is required.
1. Two anterooms shall be erected inside of the space, attached together with zippered doors.
 2. The first anteroom is the main entry from the public access or non-construction zone. It will allow access into the second anteroom that is attached to the opened ceiling leading to the attic space. A manometer shall be attached to this first anteroom. A flexible duct shall be attached to this first anteroom from a HEPA filtered negative air unit to create a minimum -0.020" water column negative pressure in the first anteroom.
 3. The second anteroom is attached to the first anteroom by means of a zippered door. Access into the attic space shall be through this second anteroom. The opening into the attic space shall be sized according to dimensions prescribed by the Owner. A flexible duct shall be attached to this second anteroom from a HEPA filtered negative air unit to create negative pressure from the first anteroom.
 4. To accomplish the above negative pressure requirements, the contractor may use one large negative air unit and split the intake duct into two smaller flexible ducts attached to the two anterooms. The second anteroom shall have the greater amount of air exhausting from this space compared to the first anteroom by adjusting the exhaust volume, since it is undesirable to draw air from the dirty space (second anteroom) into the cleaner space (first anteroom). Use of small variable speed HEPA filtered negative air units approximately 600-1000 cfm in size are the most effective means of meeting these pressure requirements.
 5. To facilitate air pressure in the two anterooms, the contractor shall seal the opening to the attic space using a hard lid to partially cover the opening for the majority of the time unless materials and personnel are entering/exiting the attic space. The hard lid can be a material that is acceptable to the Fire Marshall and is simply intended on being placed on top of the opening to the attic space to close off the access opening in order to increase negative pressure in the two anterooms below.
 6. The negative air units shall be exhausted outside of the building via windows or other locations where the exhaust can be outside the building envelope.
 7. When it is not feasible to exhaust air from the work area out of the building, the contractor shall exhaust the HEPA filtered negative air units into a location deemed acceptable by the Project Manager. The exhaust of the negative air unit may be required to be exhausted into a diffusion chamber constructed with pleated filters making up the diffusion chamber to equally disperse the exhaust air in a broad pattern. This approach is to minimize a high velocity exhaust into occupied areas of the hospital.

3.03 WORK SITE CONTROL

- A. Contractor shall restrict the work areas to authorized, trained and protected personnel; including, the Contractor's employees, University Representatives, and state agency representatives.
- B. At regulated job sites, the Contractor shall use plastic barriers to demarcate the boundary of the work zone and post on the interior door a warning sign as required by 8 CCR 1529:

**DANGER
ASBESTOS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
AUTHORIZED PERSONNEL ONLY**

WEAR RESPIRATORY PROTECTION AND PROTECTIVE CLOTHING IN THIS AREA

- C. All unauthorized personnel are to remain outside the regulated area. Contractor is to call the University's Representative or the Project Manager if unauthorized personnel enter the regulated area and do not leave upon request by the Contractor.
- D. If inclement weather threatens the job site, Contractor shall take all necessary measures to ensure asbestos contaminated debris does not migrate from the regulated areas.
- E. If wind speed threatens the job site, Contractor shall erect a wind barrier or suspend operations until the wind is below 15 mph.

3.04 RECORD KEEPING

- A. Contractor shall maintain the following records at the regulated work area:
 - 1. Site Log (sign-in/sign-out for all people entering the containment).
 - 2. Incident Log & Emergency Action Plan.
 - 3. Personal air sampling results including chain of custody forms and laboratory analysis.
 - 4. Laboratory results from area samples collected inside and outside the regulated area.
 - 5. Asbestos supervisor and worker training certificates, current respirator fit tests, current medical clearance certificates.
 - 6. All applicable notifications, including, but not limited to SMAQMD and Cal/OSHA and any revised notifications during the course of the project.
 - 7. Copies of all Safety Data Sheets for materials present or used on the project.
- B. The UC DMC Representative's shall retain all records of samples related to the project and report results in the closeout documentation to be submitted at the end of the project.

3.05 ADMINISTRATIVE CONTROLS

- A. ****NOT USED OR ** Asbestos work will be performed after normal working hours (Monday-Friday, 7:00 AM to 5:00 PM)**
- B. Construction work performed in high heat environments requires the Contractor to provide sufficient breaks and drinking water to maintain a safe work environment and to reduce the potential for heat stress.

- C. Contractor shall clean the work site before all breaks and at the end of the shift. Asbestos containing materials and debris shall be HEPA vacuumed daily to maintain a clean work area. At least one HEPA vacuum shall remain inside of the work area every day and available for use during work activities.
- D. During the removal process for class I, II and III asbestos work, an AHERA trained Contractor/Supervisor must be on-site. During work in asbestos contaminated attic spaces, an asbestos Competent Person, as defined by T8 CCR 1529, shall be present at all times to oversee safe access and control measures.

3.06 ENGINEERING CONTROLS

- A. Negative Pressure Enclosure (NPE)
 - 1. See Section 3.02 describing the required negative air unit configuration to meet the Cal/OSHA requirements for asbestos related work, which requires a minimum -0.020" water column negative pressure between the work area and the surrounding space.
 - 2. (Edit as necessary) A negative pressure enclosure is required when asbestos containing materials are being removed or disturbed on this project site.
 - 3. There are two types of negative pressure enclosures: full containment and mini-containment. Both containments require proper warning signs in accordance with Cal/OSHA to establish a restricted asbestos regulated area.
 - 4. Full containment for asbestos related work requires the contractor to comply with all provisions in CCR, 8, 1529 and SMAQMD Rule 902. The following items are provided as a reminder of key elements and is not meant to be comprehensive: two layers of six-mil polyethylene on floors, two layers of four-mil polyethylene on walls, three stage decontamination unit with shower, sufficient negative pressure to maintain at least -0.020" of water column pressure differential, clear viewing ports, recording manometer, fire extinguishers, and emergency response protocols.
 - 5. *(Leave the following paragraph in place if appropriate) Removal of the asbestos containing fireproofing will be required in spot locations for installation of seismic bracing, and attachment of other mechanical or electrical/piping support. The specific locations of abatement shall be determined by the various trades requiring the removal of the asbestos to perform their work. The spot abatement of fireproofing materials, ceiling systems and other asbestos contaminated materials shall be performed only by the asbestos contractor. Fireproofing shall be wetted continuously with water and a wetting agent and removed slowly by a team of at least two employees, capturing the fireproofing into waste containers or pans held up to the underside of the area being abated.*
 - 6. The construction of a mini-containment for asbestos work requires at least one layer of six mil polyethylene with zippered doors to restrict airflow and a HEPA filtered vacuum. (Edit as necessary) A negative air unit shall be attached to the mini-containment to maintain negative pressure inside the mini-containment on this project. Comply with all mini-containment requirements as stated in Title 8 CCR 1529. Mini-containments shall have zippers on the enclosure to allow access to attic spaces, walls or subfloor spaces. Only zippered type partitions will be allowed. The older method of flapped plastic entries will not be accepted.
 - 7. Asbestos related work requiring glove bags to remove asbestos shall comply with the

02 - Existing Conditions

provisions in 8 CCR 1529. The type of glove bag must correspond to the type of activity, e.g., angle glove bags for curved pipe sections, vertical glove bags for vertical pipe, etc. Glove bags must be smoke tested after installed by the Contractor prior to removing asbestos to assure they do not leak. All glove bag work requires at least two people working together as required in Title 8 1529.

8. An Infection Control Risk Assessment (ICRA) Permit will be developed for this project by the University's Representative and approved by the Medical Center's Infection Prevention with oversight by EH&S. Depending upon the location of the work and the potential for dust generation that could impact patient care, the ICRA may require more stringent controls than those described under this specification. Adequacy of controls may be verified by periodic airborne particle counting, conducted by EH&S or by a representative of the Owner. Contractor understands that any operations generating particles in excess of particle count requirements will require the Contractor to modify the project site engineering controls and work practices. Contractor is responsible for maintaining engineering controls and work practices so excessive airborne particulate is not released.
9. Sticky mats are required to be present in the decontamination unit (first anteroom) and immediately outside of the first anteroom in the non-construction work area. The sticky mats shall be changed on a daily basis to keep them effective at cleaning the soles of the shoes. The sticky mats are a requirement of the ICRA Permit for the duration of the project through completion of all new construction. They will be required through final detail cleaning or final terminal cleaning for each space the construction work activity has impacted.
10. (Add additional engineering control discussion here that is specific to the project).

B. Wet Methods

1. Prior to removing ACM/PACM, the contractor shall adequately wet the material with water that may have an approved surfactant added. Once removed, the waste must be kept wet until it is placed into six-mil asbestos labeled bags. Asbestos debris generated during the project shall remain wetted at all times until the waste debris is sealed into waste bags.

3.07 WORKER PROTECTION

- A. The following protective measures are required for asbestos related work associated with this project:
 1. Respiratory Protection
 - a. Respiratory protection shall be provided to all Contractor employees where there is the potential for exposure to asbestos at or above the permissible exposure limit. In addition, all work in the attic spaces where there is asbestos containing fireproofing or other asbestos debris, will require workers to wear respirators. Respiratory protection shall be provided at no cost to the Contractor's employees per 8 CCR 1529 and 5144.
 - b. At a minimum, half-face respirators with P-100 (HEPA) filters shall be provided to

all employees required to work inside of the asbestos contaminated spaces. Employers shall provide full-face powered air purifying (PAPR) or full hood type respirators to those employees who request one at no additional cost to the employee pursuant to 8 CCR 1529. If personal air sampling of specific work practices identify asbestos exposures above the protection factor of a half-face respirator, the contractor will be required to go to a higher level of protection which will include the use of a tight fitting full-face powered air purifying respirator.

- c. If personal air samples exceed the protection factor of the respirator, work shall stop for that trade contractor performing the work. Engineering controls and work practices shall be evaluated by the UC DMC Asbestos Consultant to determine reasons for the elevated exposures. Changes to work practices and engineering controls will be required in order for the contractor to begin work again, in addition to the requirement for those employees to wear full-face PAPRs.
- d. The asbestos abatement workers shall wear full-face powered air purifying respirators (PAPRs) during removal of fireproofing, ceiling plaster, and other mechanical systems and electrical equipment that is contaminated with asbestos. The contractor shall use the manufacturer's flow meter every day for all respirators at the start of the day and after break periods to make sure the air flow into the PAPRs meet the minimum air flow into the face piece.
- e. Contractor asbestos employees who wear a respirator shall have passed a respirator fit test within the previous 12 months to perform work on the project. All workers required to wear a tight fitting respirator shall be clean shaven and not have any facial hair interfering or contacting the seal of the respirator with the worker's face. Workers who are observed inside of the asbestos contaminated work area with facial hair contacting the respirator seal will be asked to immediately leave the work area and shall not be allowed to return until clean shaven and a new respirator fit test has been provided and the individual passes.

2. Protective Clothing

- a. Workers shall be provided with sufficient sets of protective clothing whenever there is potential exposure to asbestos dust at or above the permissible exposure limit. Tyvek, Kleenguard coveralls, or an equal with attached hood and foot coverings are required. The coveralls shall be available at no cost to the Contractor's employees, UC DMC consultants, and state officials. Disposable coveralls shall be replaced or repaired when they rip or tear or become damaged to the point where they are not providing protection to the worker. At no time shall workers performing work in an asbestos contaminated work area leave the containment while wearing the disposable coverall. The coverall shall be removed inside of the mini-enclosure or work containment prior to the worker exiting the enclosure.
- b. At no time shall workers be allowed to leave the general construction work area in work shoes tracking out dust onto the floor. The ante room shall be used to clean shoes before entering into the adjacent corridors. The sticky mats shall be changed at sufficient frequency and at least daily to minimize tracking out dust outside of the construction work area.
- c. Contractor shall provide rubber or latex gloves, rubber boots, eye protection, ear plugs and hard hats as needed per the California Code of Regulations, Title 8, Hazard Communication and Personal Protective Equipment sections.

3. Medical Surveillance

- a. As required by 8 CCR 1529, the asbestos Contractor shall establish a medical surveillance program for all employees who may be exposed to asbestos at or above the permissible exposure limit. This requires an asbestos medical exam in accordance with Title 8 1529. All employers shall provide copies of the physician's written opinion for each employee who works on the project pursuant to 8 CCR 1529.
- b. Contractor will provide copies of the physician's written opinion for each employee who is required to wear a respirator confirming the ability of the employee to wear a respirator with no restrictions in accordance with 8 CCR 5144. This requirement applies to all asbestos employees and to all other employees required to work in the asbestos contaminated attic space, while wearing a respirator.
- c. All asbestos workers and asbestos supervisors shall pass the medical examination, FVC, FEV and chest x-ray examinations prior to working on the project.

3.08 PERSONAL HYGIENE

- A. No employee will be allowed to consume food, tobacco products or beverage in the regulated work area or any part of the building scheduled for asbestos abatement or in-place management operations. No food containers, water bottles, or any food will be allowed inside of the containment while work is performed under asbestos contaminated work conditions.
- B. Contractor shall establish a location outside the work area, which will be designated for employee eating and drinking. Employees must utilize the on-site decontamination facilities prior to entering the designated eating/drinking location. All workers entering the work containment shall wear proper shoes. Tennis shoes are not acceptable.
- C. The asbestos contractor shall install a three-stage decontamination unit for the asbestos abatement work and it shall be contiguous with the area that is being accessed. The clean room shall be sized and equipped to adequately accommodate the work crew. Lighting, heat and electricity shall be provided as necessary for comfort. This space shall not be used for storage of tools, equipment or materials (except as specifically designated), or as office space. Shower room shall contain one or more showers as necessary to adequately accommodate workers. The shower enclosure shall be constructed to ensure against leakage of any kind. In addition, the shower shall be a separate unit from the decontamination unit walls. The shower unit cannot be made from poly. Metal or hard plastic is acceptable. The third chamber equipment room (dirty room) shall be sized to accommodate movement of materials, equipment and supplies into and out of the containment work area.
- D. An adequate supply of soap, shampoo and towels shall be supplied by the Contractor and available at all times. The shower shall provide hot water, which will require the contractor to bring a portable hot water heater for this purpose. Shower water shall be drained, collected and filtered through a system with at least 5.0 micron particle size collection capability. The shower pan in the shower chamber shall be, at least, 3' x 3' in size. The shower chamber shall be constructed so that no water from the shower can spray out of the chamber, or any water run down the sides of the poly and miss the pan. The shower chamber dimensions shall be

determined by the size of the shower pan but are not to be smaller than 3' wide by 3' long by 7' tall. At least one shower shall be provided for each 10 workers.

- E. After the asbestos abatement work has been completed by the asbestos contractor, the shower shall remain attached to the second anteroom for use by the various trade contractors if they choose to use the shower.

3.09 AIR MONITORING PROGRAM

A. Personal Air Samples - Contractor Responsibility

1. The asbestos Contractor must presume Class I, II, and III work will exceed the PEL and conduct air sampling for asbestos in accordance with 8 CCR 1529. The air sampling results will not be used to determine if respiratory protection will be required. Respiratory protection will be required during all asbestos abatement activities and during access at any time into the attic spaces, regardless of the air sampling results. The air sampling results will be used to assess the effectiveness of engineering control measures.
2. At least 25% of the asbestos workers per work shift shall be evaluated for asbestos assessment on a daily basis by the Contractor using personal air sampling. The asbestos contractor is responsible for collection of air samples on the various trade workers performing work in asbestos contaminated work spaces.
3. Sample results shall be emailed to UCDCM Project Manager Representative, (*Name of Project Manager*), FAX 916-734-7751; UCDCM EH&S Kaila Benton-Vitz FAX (916) 734-7309; and UCDCM Representative's Consultant, (*Name of Asbestos Consultant and name of Company*) FAX .
4. Daily monitoring may be discontinued for a particular operation when a negative exposure assessment has shown the operation was performed below PEL for three continuous shifts. This exception does not apply when the scope of the job has changed, ACM/PACM has changed or the UCDCM Representative feels the work protocol is compromised, e.g., less skilled workers are not performing up to standard.
5. Personal air samples for asbestos exposures shall be collected of workers in the asbestos contaminated attic space or in locations with ceiling open to the attic space during work installing plumbing, electrical, HVAC, ceiling system and other trade work.
6. A Negative Exposure Assessments (NEA) established outside the University is unacceptable. NEAs performed on the campus that "closely resemble" current work shall be considered. Final acceptance of an NEA is made by EH&S and the UCDCM Representative. Review and acceptance of NEAs will not be used to exclude the use of respiratory protection.
7. Air sample results are required to assess the trade workers in the attic space to determine if a higher level of respiratory protection is required (PAPR), additional work practices are required, and if showering by the trade workers will be required.

B. Area Sampling

1. Daily Monitoring - University's Representative's Responsibilities
 - a. The UCDCM Representative is responsible for monitoring air quality within the regulated area; including the clean room and immediately outside of the clean room. Any sample at or above 0.1 f/cc in the clean room or outside of the clean

room requires a cessation of work until the area is cleaned, the cause of the problem has been determined and remedied. Air samples in the work zone that exceed the protection level of a respirator require a cessation of activity and review of work practices by the Contractor's supervisor and the UCDCM Representative. The UCDCM Representative may utilize the asbestos contractor's personal air sampling results to assess the work area air concentrations if the sampling protocol used by the contractor are deemed reliable.

3.10 SPECIFIC WORK PROTOCOLS

A. The specific work protocols are intended as a supplement to the contract provisions. Contractor shall comply with specific work protocols and all other specifications. Where a conflict in specifications exists, the higher standard applies. Not all of the asbestos materials described below might be impacted by the project. They are provided in the event the project expands and the specific materials are impacted. (Edit this section to address asbestos materials specific to the project and eliminate those materials below that are not involved in the project. Be specific with requirements for clarity. Expand the requirements for the different materials depending upon each project)

1. Acoustical Ceiling Tiles (suspended ceiling)
 - a. Class II or III
 - b. Friable
 - c. Respirator Required
 - d. No NPE if Class III, NPE for Class II, HEPA vacuum, Wet Method
 - e. Work Practices:
 - 1) Remove individual ceiling tiles from grid work using caution not to damage the metal grid work. Protect lighting fixtures and smoke/heat detectors scheduled to remain.
 - 2) Where removal of metal grid work is required, tie-up lighting fixtures and/or heat/smoke detectors. Removal of metal grid work will include all wire hangers, perimeter and interior grid work.
 - 3) Where lighting fixtures are scheduled to be removed, clean lighting fixtures and apply a single layer 6-mil plastic or bag and sealed with tape. All lighting fixtures shall be turned over to the University's Representative.
 - 4) HEPA vacuum and wipe down all exposed surfaces above the ceiling system removed and then apply an approved encapsulant or lockdown material.
2. Acoustical Wall and Ceiling Tiles (glued on – whether the mastic contains asbestos or not)
 - a. Class II or III
 - b. Friable

- c. Respirator Required
- d. NPE, Wet Method, HEPA vacuum
- e. Work Practices:
 - 1) Remove tile in small sections capturing individual tiles in a container as close to the point of removal as possible, in order to minimize the amount of material dropping to the floor.
 - 2) Debris and waste spilled onto floors, ladders or other surfaces shall be cleaned up as soon as possible. Under no circumstances shall debris be left at the end of the workday.
 - 3) Scrape and remove tile adhesive flush with wall and ceiling surfaces.
- 3. Air Cell Pads
 - a. Class I, II or III
 - b. Non-friable if intact
 - c. Respirator Required
 - d. No NPE if Class III, NPE for Class II, Wet Method, HEPA vacuum
- 4. Asbestos Cement Pipe (intact)
 - a. Class II
 - b. Non-friable
 - c. Respirator Required
 - d. No NPE
 - e. Work Practices:
 - 1) Disconnect service to the pipe.
 - 2) Mark pipe in lengths of approximately six (6) to ten (10) feet or other reasonable length to handle.
 - 3) Wrap pipe with lagging intact with two (2) separate layers of 6-mil plastic, securely and completely taped.
 - 4) Disconnect service to pipe being removed.
 - 5) Place plastic underneath pipe and supports to catch falling pieces.
 - 6) Carefully supporting all portions of pipe/paneling, break into sections using chain snap cutter or the means of cutting or breaking without creating dust. Power cutters or saws are not acceptable.
- 5. Glasweld, wainscot, and adhesive
 - a. Class II or III
 - b. Non-Friable
 - c. Respirator Required
 - d. No NPE if class for class II, HEPA vacuum
 - e. Work Practices:

- 1) Remove material in manageable sections without sizable quantities of materials dropping to the floor.
 - 2) Do not sand, grind, blast or mechanically chip or abrade surfaces to remove adhesive.
 - 3) Scrape wall surfaces to remove excess adhesive flush with wall surface.
 - 4) Wipe down all exposed surfaces prior to applying an approved encapsulant or lockdown material.
6. Gaskets
- a. Class III
 - b. Friable
 - c. Respirator Required
 - d. No NPE Dispose at Class III Land Fill
7. Gypsum board and joint compound
- a. Class II or III
 - b. Friable
 - c. Respirator Required
 - d. NPE, Wet Method, HEPA vacuum
 - e. Work Practices:
 - 1) Remove material in sections manageable without sizable quantities of materials dropping to the floor.
 - 2) Use a power tools to cut material to be removed with a HEPA vacuum attached to the shroud. Hand cutting with a scoring knife shall be permitted as an alternative option. Keep all cuts moistened to minimize dust.
 - 3) Keep debris and dropped waste material to a minimum. Under no circumstances shall debris be left at the end of the workday.
 - 4) Construct mini-containment or attach modified glove bag to wall surfaces; attach materials with taped portion being attached to tape strips applied directly to wall, floor and ceiling surfaces. Allow adequate room for maneuvering of hands within containment.
 - 5) Spray gypsum board to be removed with water and hand cut perimeter of material to be removed with a knife.
 - 6) Allow wetted material to drop into bottom of glove bag.
 - 7) Evacuate air from glove bag and wall cavity using HEPA vacuum; tie off lower section of glove bag prior to spraying wall and ceiling surfaces and cavity with encapsulant.

- 8) For locations requiring back to back abatement; leave glove bag or mini-containment in place until work has been completed on both sides of the wall.
8. HVAC insulation
 - a. Class I
 - b. Friable
 - c. Respirator Required
 - d. NPE, Wet Method, HEPA vacuum
 9. Linoleum floor backing and adhesives
 - a. Class II or III
 - b. Friable
 - c. Respirator Required
 - d. NPE, Wet Method, HEPA vacuum
 10. Paints (textured)
 - a. Class II or III
 - b. Friable
 - c. Respirator Required
 - d. No NPE if class III, NPE for class II, HEPA vacuum, Wet Method
 11. Plaster (interior and exterior)
 - a. Class II or III
 - b. Friable
 - c. Respirator Required
 - d. No NPE if class III, NPE for class I, HEPA vacuum, Wet Method
 - e. Work Practices:
 - 1) Remove plaster material in manageable sections without sizable quantities of materials dropping to the floor.
 - 2) Work shall include removal and disposal of plaster, expanded metal mesh and non-structural ceiling joists. Bag all materials as removed. Tape sharp edges as needed to prevent the bag from being punctured.
 - 3) Do not use power tools to cut material to be removed. Keep all cut material edges and surfaces moistened to minimize dust.
 - 4) Keep debris and minor dropped waste to a minimum, and immediately moisten and clean up. Under no circumstances shall debris be left at the end of the workday.

- 5) HEPA vacuum and wipe down all exposed surfaces to remain prior to applying an approved encapsulant or lockdown material.
12. Rubber Cove Base Adhesive
 - a. Class II or III
 - b. Non-Friable
 - c. Respirator Required
 - d. No NPE if class III, NPE for class II, HEPA vacuum, Wet Method
 - e. Work Practices:
 - 1) Provide protective splash barriers for all wall surfaces. Contractor shall provide decontamination systems at all personnel exits from the work area.
 - 2) Remove material in manageable sections.
 - 3) Do not sand, grind, blast or mechanically chip or abrade surfaces to remove adhesive.
 - 4) Scrape off excess adhesive flush with wall surface.
 - 5) Wipe down all exposed surfaces prior to applying an approved encapsulant or lockdown material.
 13. Roofing Material
 - a. Class II or III
 - b. Friable and Non-friable
 - c. Respirator Required
 - d. No NPE, Wet Method, HEPA vacuum
 - e. Work Practices:
 - 1) If appropriate, remove ballast as non-asbestos containing material according to usual roofing practice. Mechanized ballast removal is permitted provided ACM roofing felts are not disturbed.
 - 2) Power tools shall not be used to remove asbestos-containing roofing materials. Only shovels, spud bars, scrapers, hand axes or other hand tools may be used.
 - 3) With hand ax or similar tool, chop the membrane into hand manageable sections or "tiles" (approximately 2' X 2').
 - 4) Before lifting cut membrane sections, mist the open cuts between sections with water.
 - 5) With hand tools pry the membrane tiles free.
 - a) Scrape wall and roof substrate to remove roofing mastic. Apply additional water as needed to thoroughly saturate cut edges, and any loose debris exposed or generated by the cutting and removal operations.

- 6) As membrane tiles are removed, place them in clear 6-mil bags with asbestos warning labels. Use caution not to over fill bags. Seal bags close with tape.
 - 7) If holes in filled bags are discovered anywhere in the removal or disposal process, seal with duct tape.
 - 8) Asbestos-containing roofing materials shall not be chuted to the ground, nor handled in any manner; i.e., tossed, dropped or smashed in a manner which creates dust or particulate ACM. Materials are to be bagged and hand carried or lowered by crane or mechanical lift to the ground.
 - 9) Bagged material must be hand carried or cradle lifted from the roof to an appropriate waste disposal vehicle or container.
 - 10) If materials are lowered by crane or mechanical lift, University's Representative shall approve crane placement in advance.
 - 11) Asbestos-containing roofing tiles or shingles are to be handled in a manner similar to bituminous roofing materials (also, see section on transite). In general minimize breakage of individual tiles and shingles.
 - 12) Apply water to loose debris remaining when roofing materials have been removed. HEPA vacuum the substrate and apply lock-down encapsulant.
14. Soil (asbestos contaminated)
- a. Class II or III
 - b. Friable
 - c. Respirator Required
 - d. No NPE if class III, NPE for class II, HEPA vacuum
 - e. Work Practices:
 - 1) All foundation vents, grates and other openings will be securely sealed with plastic and tape.
 - 2) Contractor shall set grade stakes on minimum fifteen (15) foot centers throughout the area from which soil is to be removed. Depth of removal shall be: **(SPECIFY)**.
 - 3) Contaminated soil shall be dampened and kept damp during removal operation.
15. Steam/Hot Water Pipe Lagging (horizontal, vertical, joints, valves)
- a. Class I or III
 - b. Friable
 - c. Respirator Required
 - d. NPE, Wet Method, HEPA vacuum
 - e. Work Practices
 - f. Class III Work Practices:

- 1) Contractor shall comply with UCD access protocols, which requires respirator and double suit.
 - 2) Apply duct tape completely around the pipe at point where glove bag will be attached.
 - 3) Slit glove bag down sides; install on pipe with taped portions being attached to tape strips applied to pipe. Allow adequate room for maneuvering of hands at top of glove bag.
 - 4) While assistant sprays lagging continuously with water amended with surfactant, cut lagging around its circumference using handsaws, knives, or other cutting tools.
 - 5) Remove wetted lagging, drop into bottom of glove bag.
 - 6) Clean surface under section of removed lagging using toothbrush, towel, etc.
 - 7) Evacuate glove bag using HEPA vacuum cleaner; tie off glove bag.
 - 8) Remove glove bag from pipe. Seal glove bag using at least two closures. Seal exposed lagging ends with bridging agent and Carlisle Hardcast wettable cloth or equivalent.
 - g. Class I Work Practices
 - 1) Set up full containment
 - 2) Establish baselines and conduct area monitoring throughout the project.
16. Transite (siding, shingles, furnace flue, and duct)
- a. Class II or III
 - b. Friable and Non-friable
 - c. Respirator Required
 - d. No NPE, Wet Method
 - e. Work Practices:
 - 1) Provide plastic on the horizontal surface below the area of work extending out sufficient to capture material being removed.
 - 2) Remove material in manageable sections and lengths without sizable quantities of materials dropping to the floor or ground using wet methods.
 - 3) Where possible, remove mechanical fasteners without any abrading of transite material.
17. Floor Tiles, rubber cove base and adhesive
- a. Class II or III
 - b. Non-friable
 - c. Respirator Required
 - d. No NPE if class III, NPE for class II, Wet Method, HEPA vacuum
 - e. Work Practices:

- 1) Flooring shall be removed only by hand or mechanical methods which do not create dust. These include dry ice/blanket, hand and power scrapers, spud bars, etc. Do not sand, grind, blast or mechanically chip or abrade.
 - 2) Adhesive shall be removed only by wet methods or by approved solvent.
18. Window Putty
- a. Class II or III
 - b. Friable
 - c. Respirator Required
 - d. No NPE, Wet Method, HEPA vacuum
 - e. Work Practices:
 - 1) Provide plastic on the horizontal surface below the area of work extending out sufficient to capture material being removed.
 - 2) Remove material in manageable sections and lengths without sizable quantities of materials dropping to the floor or ground using wet methods.
24. Above Ceiling Work - Areas with Asbestos Containing Fire Proofing or Pipe debris
- a. Class III - only for repair or maintenance work, no abatement
 - b. Friable
 - c. Respirator Required
 - d. NPE, Mini-containment
 - e. Work Practices:
 - 1) Use of a respirator, disposable protective coverall, and gloves are required to enter above the ceiling.
 - 2) A mini-containment or other NPE must be set up and used by employees to safely enter the attic space above the ceiling system. The mini-containment/NPE must be kept under negative pressure using at a minimum a HEPA vacuum that has been certified within the last year or last filter change, whichever is more recent.
 - 3) Clean the entry area above the ceiling with a HEPA vacuum before completely entering the space.
 - 4) If practical, vacuum visible insulation debris for the full path of travel. If this is not practical the employee must use other procedures to ensure safe removal of visible insulation debris in the path of travel that would be disturbed by the crawl. For example, wet paper towels and plastic bags may be used to pick up and contain visible debris. Other control methods may be used provided they meet the following criteria:
 - a. dry sweeping is not permitted
 - b. employees must not walk on, crawl on or otherwise crush visible clearly recognizable insulation debris
 - c. the control method must not result in a release of airborne fibers

- 5) If disposable coveralls get torn during the work activity, immediately repair the torn coverall with duct tape or exit the area and put on a new coverall. Before leaving the mini-containment inspect the personal clothes and shoes/boots of any person that entered the above ceiling area and remove any visible debris using the HEPA vacuum.
- 6) Upon completion of work at that location, inspect the floor where the mini-containment was set up and remove any debris using the HEPA vacuum.

3.11 INSPECTIONS

A. Inspection Responsibilities - Contractor

1. Prior to beginning any asbestos-related work, Contractor's asbestos supervisor shall inspect the regulated work areas for any building damage, hazardous conditions, and/or irregularities that may contribute to an unsafe work environment. Any condition that poses a hazard or potential hazard to the Contractor's employees or the University community must be immediately reported to the UCDMC Representative.
2. Contractor is responsible for monitoring and enforcing all requirements of this specification. This responsibility includes communicating scheduling changes to the UCDMC Representative to allow inspections at each phase of the project.
3. Contractor shall provide protocols for responding to loss of negative pressure after they have left the job site. Under no circumstances shall Contractor shut off negative air machines at the end of the shift, unless the job has received final clearance. Emergency mobile telephone numbers shall be provided of key asbestos Supervisors on the project to the University's Representative in the event they need to be contacted after off hours.
4. At the end of each shift, the Contractor shall adequately wet waste, collect all loose debris, place it in double 6 mil poly bags, and label the material. The asbestos waste may remain inside the containment, provided access controls are secure. If the Contractor cannot guarantee access control, the asbestos waste must be secured in a locked storage container.
5. The Contractor supervisor shall perform a thorough pre-final visual of the containment work area and adjacent surfaces prior to requesting that the University's Hazardous Materials Representative conduct a final visual inspection. The pre-final visual performed by the Contractor shall verify that all materials have been completely removed from the work area.

B. Inspection Responsibilities – UCDMC Representative Asbestos Consultant Responsibilities

1. Shall walk the job site with the Contractor to review pre-cleaning operations and any safety or security issues and may attend contractor safety meetings.
2. Shall verify pre-cleaning was performed in accordance with the specifications.
3. After the Contractor has completed set-up and before commencing operations, the UCDMC Representative shall check completeness of the following items: regulated area is demarcated and posted with Cal/OSHA asbestos warning signs, permits are posted,

poly sheeting is six mil, double layers, all HEPA equipment is challenge leak tested and passed the challenge tests, electrical tools are connected to GFCI, HVAC is shut off and all supply and return registers (if possible), exhaust register are sealed with six mil poly, electrical panels are tagged and locked out (if possible), electrical outlets are sealed with 6 mil poly, a fire extinguisher is available outside the containment, and water connections are made with a back flow prevention device. If a NPE is used, the inspector will verify: a minimum of -0.020" of water pressure is maintained, three-stage decontamination is sealed and air flow is correct, and the shower is functioning with a hot water heater, soap, shampoo, and disposable towels.

4. Prior to asbestos abatement or in-place management activities beginning, the UCDCM Representative shall match on-site personnel with asbestos training certificates, fit tests and medical exam records. Workers without current and valid on-site documentation shall not be allowed in the regulated area.
5. The UCDCM Representative is responsible for reviewing all samples and alerting EH&S staff and the UCDCM Project Manager, of any personal or area air samples exceeding 0.1 f/cc.
6. During abatement or in-place management activities, the UCDCM Hazardous Materials Representative shall check for the following: all personnel are signing in and out, wet methods are being used, debris is collected at the end of each shift, workers are properly wearing disposable coveralls and respirators, and work is performed in a safe manner.
7. The UCDCM Representative shall file a report with the UCDCM Project Manager in the frequency desired by the UCDCM Project Manager.
8. When only spot removal of fireproofing is performed for attachment of bracing, etc., clearance air sampling is not planned for the small spot abatement work in the attic space.
9. In the event of asbestos abatement when encapsulation is required, the following will apply. After abatement or in-place management activities are complete and before lockdown or encapsulant is sprayed, the UCDCM Representative shall verify: completeness of abatement or in-place management work by conducting a thorough visual inspection of the work area, confirm and approve the lockdown (encapsulant) being used, and confirm all SDS are on-site for materials used by the contractor.
10. Shall review clearance protocols with the Contractor prior to clearance monitoring. If clearance is not achieved, the Contractor shall re-clean the containment area prior to re-sampling the regulated area. All re-sampling costs due to clearance monitoring failure are the responsibility of the contractor.
11. After clearance has been achieved the UCDCM Representative shall ensure the work area is clean and free of all equipment, all waste has been removed in accordance with University protocols, keys are returned and the Contractor has restored the room to its original condition or to an otherwise agreed upon state.

3.12 CLEAN-UP

A. Daily Clean-Up

1. The project work area shall be cleaned on a regular basis. The interior of the anterooms shall be free of all visible debris and materials. At the end of each work shift, the floor of

02 - Existing Conditions

the anterooms shall be HEPA vacuumed or wet wiped or both to remove all debris from the plastic surfaces. The sticky mats shall be change on a regular basis to be effective.

2. Where asbestos is removed from spot abatement, all asbestos debris shall be adequately wetted, collected, and placed into two 6 mil plastic bags with Cal/OSHA asbestos warning labels attached. Additional labeling requirements will be required for friable waste materials. Excess air shall be HEPA vacuumed from the bag, and shall be closed in a goose-necked fashion and secured with tape. No bag shall exceed a gross weight of 30 lbs.
3. Materials exceeding the size of a 60" bag may be sealed in "burrito" wrap fashion which requires the materials to be adequately wetted, then double wrapped in 6 mil plastic sheeting and sealed air tight with tape, Cal/OSHA asbestos warning labels attached or the black diamond label, generator name and address and Waste Manifest number attached if the waste is friable asbestos materials.
4. At the end of each work shift, all asbestos waste shall be secured in a locked container. The containment shall also be made secure such that unauthorized access is not allowed during off-work hours.

B. Final Clean-Up

1. HEPA vacuum all visible debris and dust on the inner (top) layer of poly.
2. Wipe down interior surface of the inner (top) layer of poly of all gross asbestos debris.
3. Remove inner (top) layer of poly and dispose as asbestos waste.
4. HEPA vacuum or wipe all visible dust and debris from the outer (bottom) layer of poly.
5. Apply encapsulant inside of the entire containment area.
6. Remove the outer (bottom) layer of poly and clean all visible dust and debris that is present behind this poly shall be cleaned by HEPA vacuuming and wet wiping. At this time only the critical barriers shall remain in place with the building finishes exposed and in need of final detail cleaning. Floor and wall poly shall be removed prior to the clearance air sampling, unless specific changes have been approved by the UCDCM Hazardous Material Representative.
7. When step 6 is achieved, the area is ready for clearance sampling with the critical barriers and decontamination unit left in place with the work area still under negative pressure.

3.13 WASTE DISPOSAL

- A. The Contractor shall propose their choice of hazardous waste site that accepts asbestos to EH&S and obtain EH&S approval of the hazardous waste site before the Contractor ships off the waste material. EH&S must be contacted at least five working days prior to the date of first shipment.
 1. Contractor shall comply with all waste protocols established by EH&S. These protocols explicitly require Contractor to properly complete the Uniform Waste Manifest form. Failure by Contractor to complete Contractor's portion of the form shall result in the Contractor assuming the fine imposed by the responsible agency.

B. Packaging Asbestos Waste

All asbestos containing waste material must be packaged in one of three ways: (1) placed in two 6 mil clear polyethylene bags that are sealed with the “gooseneck” style, (2) placed in one 6 mil clear polyethylene bag and then placed into a sealed drum (DOT approved) or (3) double wrapped in opaque 6 mil polyethylene sheeting (AKA “burrito style”). For options 1 and 3 wet wipe the outer surface before storing material.

C. Labeling Asbestos Waste

Each bag, drum, or “burrito” wrap shall have a label affixed with the following information: (1) Hazardous Waste warning, (2) Generator’s Name, address, and phone number, (3) Location information, e.g., Building, department, room, (4) manifest document number, (5) date, and (6) Generator’s EPA Identification Number. Contractor can generate the label or use bags with label information stenciled on the side. For non-hazardous asbestos waste, a Hazardous Waste Manifest is not required; however, at a minimum, the Cal/OSHA asbestos warning label is required per Title 1529.

<p>HAZARDOUS WASTE – State and Federal Law Prohibiting Improper Disposal. If found, contact the nearest police or public safety authority, the U.S. Environmental Protection Agency or the California Department of Toxic Substances Control.</p> <p>Date: _____</p> <p>Generator’s Name/ Address/Contact Number: _____</p> <p>Generator’s EPA ID: _____</p> <p>Manifest Tracking Number: _____</p> <p>Project Location: _____</p>
--

ADD:

Each asbestos package or container must have a caution label affixed to the outside. That label must be conspicuous and contain legible lettering that spells the following warning [\[29 C.F.R. §§ 1926.1101\(j\)\(5\), 1926.1101\(k\)\(8\); Cal. Code Regs., tit. 8, § 5208\(j\)\(5\)\]](#):

02 - Existing Conditions

D. Transporting Waste

All sealed waste bags removed from the work area containment shall be transported inside of closed leak tight plastic bins with lids on wheels that can be rolled from the project area in the building to the waste bin located outside of the building. The door of the waste bin shall have the required asbestos warning sign attached and visible during all loading of the asbestos containing waste.

E. Storing Asbestos Waste Outside of a Building

At the end of each shift, all asbestos waste shall be stored in a locked container or shipped off site. Accumulated waste shall not be allowed to remain in the regulated work area overnight, unless prior approval is provided the EH&S. No container shall be allowed to remain on campus for greater than 90 continuous days from date the first asbestos waste container was generated.

F. The Waste Identification Notice and Certification must be completed by the Contractor to comply with waste stream identification requirements (Title 22, CCR). The Waste Identification Notice and Certification form can be obtained from EH&S.

G. Uniform Waste Manifest Procedures

Prior to transporting waste from the project site to a disposal facility, the Contractor shall complete the Hazardous Waste Manifest (EPA Form 8700-22). After completing Contractor's portion of the form, Contractor shall return the Manifest to EH&S for signature between the hours of 8:00 AM to 5:00 PM Monday to Friday, and will require a 24 hour notice to EH&S for the signature. Only authorized EH&S personnel can sign on behalf of the University (generator). (Site address and Generator Number will change with each project site location) The Generator is UC Davis Health. EPA ID No. CAD076124981. The Generator address is 2315 Stockton Blvd., FSSB 2500, Sacramento, CA 95817.

H. Contractor shall complete the Waste Shipment Record.

The three forms (Waste Identification, Uniform Hazardous Waste Manifest, and the Waste Shipment Record) must be submitted together as a single approval request to EH&S.

J. Transporting Asbestos Waste

A registered waste transporter, hired by the Contractor, is responsible for transporting asbestos waste from the project site to a disposal facility permitted for asbestos waste. The landfill has to be approved by UCDMC EH&S, who requires seven (7) days notice to review and approve the landfill. The transporter must make pick-ups during normal working hours (8:00 AM to 5:00 PM Monday through Friday). The transporter's vehicle must be clearly marked with warning signs.

To avoid illegal transport of asbestos waste, Contractor is responsible for knowing if the job site is contiguous with the main University campus. If Contractor must cross public streets to load asbestos waste in the container, the Contractor must comply with Sacramento Metropolitan Air Quality Management District (SMAQMD) requirements.

K. Record Keeping

The University's Representative is responsible for assisting EH&S with collecting all documents related to waste disposal operations.

L. Fees

Contractor is responsible for all fees and charges related to waste disposal operations; including, waste stream profiles. Refer to SW-846-1311 (TCLP) and CCR, Title 22 Section 66261 (STLC) for identification requirements.

3.14 CLEARANCE PROTOCOL

A. Project Specific

1. The clearance protocol to be used shall be clearly stated and communicated in advance of the UCDMC Hazardous Materials Representative beginning the clearance procedure.
 - a. All containment areas of asbestos abatement will have clearance air samples analyzed by TEM per the AHERA analytical method. The exception to this is when very small amounts of asbestos are removed, or for example when spot asbestos removal of fireproofing materials is conducted in the attic space. In these cases, clearance air sampling might not be conducted.

B. PCM Clearance Method

1. PCM analysis for clearance air samples will not be used on UCDMC projects.

C. TEM Clearance Method (Where Used or Required)

1. The TEM analytical method is the primary method that will be used on UCDMC asbestos abatement projects. Clearance protocol for TEM Method shall conform to EPA AHERA standard pursuant to 40 CFR Part 763, Appendix A to Subpart E TEM analytical methods, with the exception that fewer number of air samples may be collected and analyzed.
2. Air samples shall be collected on MCE cassettes with a 0.45 micron pore size.
3. The Contractor may elect to sample first with PCM to get an indication of the level of cleanliness.

4. After the lock down/encapsulant is settled and dry, a leaf blower will be used to agitate all surfaces within the negative pressure enclosure (referred to as the aggressive air sampling method). One or more free standing 24" fans will be placed inside of the work area to facilitate additional air movement inside the containment for the duration of the air sampling period.
5. The clearance criteria shall be the AHERA standard. The average of all air samples collected inside of the work area shall be ≤ 70 asbestos structures per millimeter squared. If the clearance criteria is not met, the Contractor is responsible to re-clean the entire containment area, and the UC DMC Representative shall collect clearance air samples again. Air sampling shall continue until the sample results meet the clearance criteria. All additional cleaning of the containment by the contractor and additional costs for the collection and analysis of the air samples will be at the expense of the contractor.

3.15 PROJECT CLOSE OUT

- A. Before the final certificate for payment is issued to the Contractor the following information shall be provided to the University's Representative:
 1. Provide post job submittals to include:
 - a. Contractor's name, address, CSLB certification number, DOSH registration number, and tax identification number.
 - b. Name of hazardous transporter, address, phone number and registration number.
 - c. A copy of the asbestos waste record showing dates, times, manifest numbers, quantities of wastes, types of containers removed from the work area, the hauler, and the signature of the recorder.
 - d. Name, address, phone number and EPA registration number of waste disposal site.
 - e. Copies of all laboratory analysis of air samples.
 - f. Building name and address.
 - g. Project name and contract number.
 - h. Describe scope of work; including, location (room numbers, approximate square footage, building system types).
 - i. Provide an inventory of the ACM/PACM removed from the job site. Include, building system, classes of asbestos related work, quantity, note whether the project was abatement or managed in-place, note whether the building system(s) was replaced.
 - j. A copy of the worker/visitor logs showing the following for all persons entering the work area: date, name, entry time, exit time, company or agency represented, and reason for entry. The Contractor's time records will not be accepted in lieu of a worker/visitor log.
 - k. Date on-site work began.
 - l. Date on-site work was completed.

- m. Copies of DOP Testing Performed on HEPA Equipment not Previously Submitted
- n. Manometer graphs identifying project name, date, and location.
- o. Copies of all accident reports submitted during the course of work. If no accidents occur during the project this should be stated in writing by the Contractor.
- p. Copies of revised notifications to all regulatory agencies.
- q. Other Documents as Requested

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 82 16 00 - ENGINEERING CONTROL OF ASBESTOS CONTAINING MATERIALS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for encapsulation (lock-down) of asbestos-containing materials. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: Manufacturers technical information including label analysis and application instructions for each material proposed for use.
2. Installation Instructions: Manufacturer's installation instructions with specific project requirements noted.
3. Performance Warrantee: Manufacturers performance guarantee.
4. Safety Data Sheet: Safety Data Sheet in accordance with the OSHA Hazard Communication Standard (29 CFR 1910.1200) for each surfactant and encapsulating material proposed for use on the work. Include a separate attachment for each sheet indicating the specific worker protective equipment proposed for use with the material indicated.

C. Delivery And Storage: Deliver materials to the job site in original, new and unopened packages and containers bearing manufacturer's name and label, and following information:

1. Name or title of material
2. Manufacturer's stock number and date of manufacture
3. Manufacturer's name
4. Thinning instructions
5. Application instructions
6. Deliver materials together with a copy of the OSHA Material
7. Safety Data Sheet for the material.

D. Job Conditions: Apply encapsulating materials only when environmental conditions in the work area are as required by the manufacturer's instructions.

E. Quality Assurance

1. Testing: Test material to be encapsulated using methods set forth in ASTM E1494 "Standard Practice for Encapsulants for Spray-or-Trowel-Applied Friable Asbestos- Containing Building Materials."

F. Warranty

1. Performance Warranty: Contractor shall submit written Performance Warranty, executed by the contractor, agreeing to repair/replace spray-on work which has cracked, fallen from substrate, or otherwise deteriorated to a condition where it would not perform effectively for its intended purposes due substantially to defective materials or workmanship and not due to abuse by occupants, improper maintenance, unforeseeable ambient exposures or other causes beyond anticipated conditions and contractors control. Warranty period shall be for at least one year after date of Final Completion.

1.2 PRODUCTS

A. Materials

1. Encapsulant system shall be an acrylic, elastomeric type, spray, brush or roller-applied, tinted penetrating or tinted bridging type, specifically designed for application to asbestos-containing

material. System shall be equal to Global Encasement System as manufactured by GLOBAL Encasement Inc., 132-32nd Street, Union City, NJ 07087 U.S.A., Tel. (800) 266-3982/(201) 902-9770.

- a. All encasement topcoat materials shall be warranted to be heavy-bodied, from the same manufacturer, and shall be long lasting, highly-pure (low VOC) materials that remain flexible, chalk resistant and resist cracking, peeling, algae and fungus that can cause future indoor air quality concerns.
- b. To allow for building movement without cracking or disturbing fibrous materials, coating systems shall have passed testing to ASTM standards for adhesion, permeability, aged flexibility and with aged elasticity for the encasement system of over 250%.
- c. Coatings shall be Class A Fire Rated, water-based, non-toxic, safe and easy to use, contain no hazardous ingredients by OSHA definition, comply with all known building codes and be non-flammable.
- d. Coating materials shall have low VOC (Volatile Organic Compound) content.
- e. Coating materials shall not release health threatening toxic smoke and fumes in a fire and shall comply with all known building codes.
- f. Coating materials shall have passed the following testing standards:
 - 1) ASTM E 119 fire tests demonstrating that applying a multi-layer system over fireproofing does not adversely affect the fireproof rating of the fireproofing (3 hour test).
 - 2) UPITT Combustion Toxicity Test proving nothing toxic is released in a fire.
 - 3) ASTM E 84 and E162 fire tests for "Class A" - Surface Flammability and Burning Characteristics (Flame Spread = 0, Smoke Developed = 5).
 - 4) "Pull-off Adhesion" test per ASTM E736 equals or exceeds 9,950 lbs./sq. ft. (89.1 lbs./sq. in.).
 - 5) ASTM D 1653 and E96 "Water Vapor Permeability" (showing the rate that water vapor can pass through the system).
 - 6) Impact Resistance, "Tensile Strength" shall exceed 150 psi; "Elongation" shall exceed 250%.
 - 7) System shall be mildew resistant, impact resistant, scrub resistant, non-yellowing, non-chalking, highly blister resistant, rust resistant, highly chemical resistant and shall remain flexible after 1000 hour ASTM Accelerated Weather testing.
 - 8) Water-Based materials (low VOC) Volatile Organic Content of Primer-Sealer-Neutralizer = 0.1 g/L (0.001 lb./gal.) and Encasement Top Coat = 0.1 g/L (0.001 lb./gal.) as tested by EPA Method 24.
 - 9) Materials comply with applicable standards for installation on interior and/or exterior surfaces of a building.
 - 10) Encasement Systems shall provide additional water-proofing protection.

B. Related Materials:

1. Elastomeric architectural sealants, caulking compounds, primers, and similar materials shall be approved by the manufacturer of the encasement coatings. All materials used shall be applied in accordance with its manufacturer's recommendations.

C. Applicable Standards

1. Product shall be rated as acceptable for use intended when field tested in accordance with ASTM E 1494.

1.3 EXECUTION

A. General

1. Prior to applying any encapsulating material in Work Areas, Contractor shall obtain final visual inspection approval by the Project Administrator.

2. Prior to applying any encapsulating material, Contractor shall ensure that application of the sealer will not cause the base material to fail and allow the sealed material to fall of its own weight or separate from the substrate. Should Contractor doubt the ability of the installation to support the sealant, request direction from the Owner's Representative before proceeding with the encapsulating work.
 3. Do Not Commence Application of encapsulating materials until all removal work within the work area has been completed.
- B. Worker Protection
1. Before beginning work with any material for which a Safety Data Sheet has been submitted provide workers with the required protective equipment. Require that appropriate protective equipment be used at all times.
- C. Application
1. Comply with all manufacturer's instructions for particular conditions of installation. Consult with manufacturer's technical representative for conditions not covered.
 2. Encapsulate all surfaces in full compliance with manufacturer's procedures.
 3. At completion of Encapsulation and before removal of Work Area enclosures and Pressure Differential System, decontaminate space in accordance with requirements of manufacturer's instructions.
 4. Remove all debris from the project site and restore area to proper conditions by cleaning all surfaces in accordance with manufacturer's written recommendations.
 5. At completion of work submit manufacturer's record of inspection of completed work and Manufacturers Performance Guarantee executed by both manufacturer and Contractor.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 82 33 00 - REMOVAL AND DISPOSAL OF ASBESTOS CONTAINING MATERIALS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for removal of friable asbestos-containing materials. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Description

1. Furnish all labor, materials, facilities, equipment, services, employee training and testing, permits and agreements necessary to perform the work required for asbestos removal, encapsulation, repair, clean-up, decontamination, re-insulation and all other work in accordance with these specifications, in accordance with the latest regulations from the U.S. Environmental Protection Agency (EPA), the Occupational Safety and Health Administration (OSHA), the recommendations of National Institute of Occupational Safety and Health (NIOSH), and any other applicable federal, state and local government regulations. Whenever there is a conflict or overlap of the above references, the most stringent provision is applicable.
2. The work specified herein shall be performed by competent persons trained, knowledgeable and qualified in the state-of-the-art techniques of asbestos abatement, handling and subsequent cleaning of contaminated areas.

C. Scope

1. The quantities of materials and limits of abatement work area(s) shall be verified by the asbestos contractor.

D. Asbestos Hazard

1. Asbestos-containing material when damaged or disturbed is subject to fiber releases. Wet methods are a primary means of controlling fiber release.
2. Strict compliance with each of the provisions outlined in these specifications for the encapsulation, repair and handling of asbestos-containing material is of great importance, because:
 - a. The inhalation of airborne asbestos fibers can cause a very serious and often fatal disease.
 - b. Workers may not be aware they are inhaling asbestos fibers.
 - c. Symptoms of the disease do not appear for many years.
 - d. Only the Contractor and its employees can prevent the inhalation of asbestos fibers, which can lead to the development of asbestos-related disease.
 - e. No insurance is available to provide for asbestos-related disease.

E. Other Hazardous Material

1. Contractor shall comply with OSHA 29 CFR 1926.62 - Lead in Construction when demolishing any equipment or architectural component identified as lead-containing or lead-based paint. The work of this project is considered a demolition activity.
2. the Owner anticipates that a substantial amount of the Project will involve lead paint.

F. Qualifications

1. the Owner and the Owner's Representative will verify and approve the experience of the Asbestos Abatement Contractor based upon submission at the time of bidding by Contractor evidence of the following:
 - a. Experience: Provide the names and locations of at least three asbestos abatement projects of comparable size and complexity comparable with this work. Provide the names

and telephone numbers of contact person at previous projects. Provide the final air monitoring decontamination fiber levels achieved.

- b. Personnel: Provide the name(s) of "Competent Person" as defined by OSHA 29 CFR 1926.32(f) - Asbestos. Demonstrate the education and specialized training with successful completion of examination of an EPA approved course. Provide evidence of participation in five projects of complexity comparable with this project.
- c. Licensing and Certification: The Contractor must hold a current, valid asbestos license issued by the State in which the work is to be performed.

G. Notices And Record Keeping

1. Contractor shall maintain for at least 30 years, a record for each asbestos project in which the Contractor engages. Each record shall include the following information: name, address, and social security number of all personnel involved with the project, the name address and social security number of the OSHA "Competent Person" who will supervise the work, the amount of asbestos material that was removed, repaired, encapsulated or disturbed, the commencement and completion date of the work, copies of Hazardous Waste Manifest(s), personal air monitoring results and any other appropriate information.
2. The Contractor shall send written notification as required by USEPA National Emission Standards for Hazardous Air Pollutants (NESHAPS) Asbestos Regulations (40 CFR 61, Subpart M) to the Owner, at least 10 working days prior to beginning any work on asbestos-containing materials.
3. Include the following information:
 - a. Name and address of the Owner or operator.
 - b. Description of the facility being demolished or renovated, including the size, age, and prior use of the facility.
 - c. Estimate of the approximate amount of asbestos material present in the facility in terms of linear feet of pipe, and surface area on other facility components. For facilities in which the amount of asbestos materials is less than 260 linear feet on pipes and less than 160 square feet on other facility components, explain techniques of estimation.
 - d. Location of the facility being demolished or renovated.
 - e. Scheduled starting and completion dates of demolition or renovation.
 - f. Nature of planned demolition or renovation and method(s) to be used.
 - g. Procedures to be used to comply with the requirements of USEPA National Emission Standards for Hazardous Air Pollutants (NESHAPS) Asbestos Regulations (40 CFR 61 Subpart M).
 - h. Name and location of the waste disposal site where the asbestos waste material will be deposited.
4. Prior to commencement of work, the Contractor shall submit the following documents to the Owner's Representative. No work will be allowed to start until these documents have been approved:
 - a. The schedule of the work, including manpower, length and number of work shifts. Schedule shall be coordinated with the Owner's full occupancy of all areas of the building.
 - b. Satisfactory proof that written notification has been provided to the EPA regional office and the Owner.
 - c. Proof that all required permits, disposal site locations, and arrangements for transportation and disposal of asbestos-contaminated materials, supplies and the like have been obtained.
 - d. Complete a worker certificate indicating that all employees have had instruction and training on the hazards of asbestos exposure, the use and fitting of respirators, protective dress, wet and dry decontamination procedures, entry and exit from work areas, and all aspects of work procedures and protective measures.
 - e. Documentation indicating that all employees have received appropriate medical examinations and have successfully passed fit testing for the respirator to be worn. As a

- minimum, medical exams must be consistent with OSHA 29 CFR 1926.1101(K)(9)(viii)(G)-Asbestos Regulation.
- f. Samples of signs to be used in and around the work area to comply with OSHA 29 CFR 1926.1101(K)(9)(viii)(I)- Asbestos regulations and as required by federal, state and municipal regulations.
 - g. Safety Data Sheets (OSHA form 174 or equivalent) for all chemicals used during work performed under this section.
 - h. Encapsulation data and encapsulation procedures.
 - i. Design of pressure differential system including calculation used to arrive at the number of machines necessary to achieve one air change per every 10 minutes.
 - j. Location of personnel and material decontamination units for each work area.
5. Contractor shall provide written notification to the Owner's Representative of its intent to start work at least five days in advance. In no case will the Contractor start work until authorization to proceed is given.
 6. During the work, Contractor shall maintain a daily log which will be kept at the job site. Items to be included in the daily log shall include but are not limited to the following:
 - a. Meetings, purpose, attendees, discussions, items of resolution.
 - b. Visitations, authorized and unauthorized.
 - c. Sign-in sheets of all personnel entering and leaving the work area.
 - d. Special or unusual events (i.e., barrier breaching equipment failures).
 - e. Personal air monitoring results.
 - f. Two copies of the daily log are required for Project Closeout.
- H. Terminology (Definitions)
1. Abatement - Procedures to control fiber release from asbestos-containing materials. Includes removal, enclosure or encapsulation.
 2. Air Lock - A system for permitting ingress or egress without permitting air movement between any two adjacent areas consisting of two curtained doorways. The air lock must be maintained in an uncontaminated condition at all times.
 3. Air Monitoring; - The process of measuring the asbestos fiber content of a specific volume of air in a stated period of time using methods approved or recommended by OSHA, EPA, NIOSH or other method approved by the Owner or the Owner's Representative.
 4. Amended water - Water to which a surfactant has been added.
 5. Asbestos - A generic name given to a number of naturally occurring hydrated mineral silicates that possess a unique crystalline structure, are incombustible in air, and are separable into fibers. Asbestos includes the asbestiform varieties of Chrysotile (serpentine), Crocidolite (Riebeckite), Amosite (Cummingtonite-Grunente), Anthophyllite, Actinolite, and Tremolite.
 6. Asbestos-containing material (ACM) - Any material that contains more than 1 percent asbestos by weight as determined by Polarized Light Microscopy (PLM).
 7. Authorized Visitor - the Owner or its designated representative, or a representative of any regulatory or other agency having jurisdiction over the project.
 8. Class I - Asbestos work means activities involving the removal of thermal systems insulation (TSI) and surfacing ACM and PACM.
 9. Class II - Asbestos work means activities involving the removal of ACM which is not TSI or surfacing material. This includes, but is not limited to, the removal of asbestos-containing wallboard, floor tile and sheeting, roofing and siding shingles, and construction mastics.
 10. Class III - Asbestos work means repair and maintenance operations where "ACM" including TSI and surfacing ACM and PACM is likely to be disturbed.
 11. Class IV - Asbestos work means maintenance and custodial activities during which employees contact but do not disturb ACM or PACM and activities to clean-up dust, waste and debris resulting from Class I, II and III activities.
 12. Critical Barrier - A unit of temporary construction which provides the only separation between an asbestos work area and an adjacent, potentially occupied, space. The critical barrier is composed of at least one intact sheet of polyethylene sheeting.

13. Decontamination Enclosure System - A series of connected rooms with curtained doorways between any two adjacent rooms, for the decontamination of workers or of materials and equipment. A decontamination system contains at least two air locks.
 14. Disposal - All procedures necessary to transport and deposit the asbestos-contaminated material stripped and removed from the building in a waste disposal site in compliance with applicable federal, state, and local regulations.
 15. Disposal Site - A site approved by the EPA for the disposal of asbestos-containing wastes.
 16. Encapsulant - A liquid which can be applied to asbestos-containing materials and which controls the possible release of fibers from the materials.
 17. Encapsulation - The use of an agent to seal the surface (bridging encapsulant) or penetrate the bulk (penetrating encapsulant) of the asbestos-containing material.
 18. HEPA -High Efficiency Particulate Air - A type of filter which is 99.97% efficient at filtering particles of 0.3 micrometers in diameter.
 19. HEPA Vacuum Equipment - Vacuuming equipment equipped with a HEPA filter in the exhaust outlet, and so designed and maintained that 99.97% of all particles of 0.3 micrometer in diameter in the inlet air are collected and retained.
 20. Negative Pressure Respirators - Respirators which function by the wearer breathing in air through a filter.
 21. NIOSH - National Institute of Occupational Safety and Health.
 22. the Owner's Representative - Authorized Consultants
 23. Permissible Exposure Level (PEL) - A level of airborne fibers specified by OSHA as an occupational exposure standard for asbestos. It is 0.1 f/cc of air, eight-hour TWA, as measured by Phase Contrast Microscopy.
 24. Repair - The restoration of damaged or deteriorated asbestos-containing material to intact condition.
 25. Respirator Protection Program - A set of procedures and equipment required by OSHA if employees wear negative pressure respirators or if fiber levels are above the PEL.
 26. Surfactant - Chemical wetting agent added to water to improve penetration, thus reducing the amount of water required for a given operation or area, and enhancing the effect of the water in reducing fiber release.
 27. Thermal Systems Insulation - Material applied to pipes, fittings, boilers, breeching, tanks, ducts or other interior structural components to prevent heat loss or gain, or water condensation, or for other purposes.
 28. Wet Cleaning - The process of eliminating asbestos contamination from building surfaces and objects by using cloths and mops or other cleaning tools that have been dampened with clean water and afterwards disposing of these cleaning tools as asbestos-contaminated waste.
- I. Permits And Licenses:
1. The Contractor must maintain current licenses as required by applicable state or local jurisdictions for the removal, transporting, disposal or other regulated activity relative to the work of this contract.
- J. Regulations
1. This section sets forth governmental regulations and industry standards which are included and incorporated herein by reference and made a part of the specifications. This section also sets forth those notices and permits which are known to the Owner and which either must be applied for and received, or which must be given to governmental agencies before start of work.
 2. Except to the extent that more explicit or more stringent requirements are written directly into the contract documents, all applicable codes, regulations, and standards have the same force and effect (and are made a part of the contract documents by reference) as if copied directly into the contract documents, or as if published copies are bound herewith.
 3. The Contractor shall assume full responsibility and liability for the compliance with all applicable federal, state, and local regulations pertaining to work practices, hauling, disposal, and protection of workers, visitors to the site, and persons occupying areas adjacent to the site. The Contractor

is responsible for providing medical examinations and maintaining medical records of personnel as required by the applicable federal, state, and local regulations. The Contractor shall hold the Owner and the Owner's Representative harmless for failure to comply with any applicable work, hauling, disposal, safety, health or other regulation on the part of itself, its employees, or its Sub-Contractors.

4. Federal requirements which govern asbestos abatement work or hauling and disposal of asbestos waste materials include but are not limited to the following regulations:
 - a. U.S. Department of Labor, Occupational Safety and Health Administration, (OSHA), including but not limited to:
 - 1) U.S. Department of Labor, OSHA, including, but not limited to:
 - a) Occupational Exposure to Asbestos, Tremolite, Anthophyllite and Actinolite; Final Rules
Title 29, Part 1910, Section 1001
Part 1926, Section 1101 of the Code of Federal Regulations
 - b) Respiratory Protection
Title 29, Part 1910, Section 134 of the Code of Federal Regulations
 - c) Construction Industry
Title 29, Part 1926.1011, of the Code of Federal Regulation
 - d) Access to Employee Exposure and Medical Records
Title 29, Part 1910, Section 2 of the Code of Federal Regulations
 - e) Hazard Communication
Title 29, Part 1910, Section 1200 of the Code of Federal Regulations
 - f) Specifications for Accident Prevention Signs and Tags
Title 29, Part 1910, Section 145 of the Code of Federal Regulations
 - 2) U.S. Environmental Protection Agency (EPA) including, but not limited to:
 - a) Asbestos Abatement Projects Rule
40 CFR Part 762
CPTS 62044, FRL 2843-9
Federal Register, Vol. 50 No. 134, July 12, 1985
P28530-28540
 - b) Regulation for Asbestos
Title 40, Part 61, Subpart A of the Code of Federal Regulations
 - c) National Emission Standard for Asbestos
Title 40, Part 61, Subpart M (Revised Subpart B) of the Code of Federal Regulations
 - 3) State requirements which govern asbestos abatement work and/or hauling and disposal of asbestos waste materials.
 - 4) Contractor shall abide by all local requirements which govern asbestos abatement work or hauling and disposal of asbestos waste materials including the following:
 - a) American National Standards Institute (ANSI)
1430 Broadway
New York, NY 10018
(212) 354-3300
 - b) Fundamentals Governing the Design and Operation of Local Exhaust Systems Publication Z9.2-79
 - c) Practices for Respiratory Protection Publication Z288.2-80
 - d) American Society for Testing and Materials (ASTM)
1916 Race Street
Philadelphia, PA 19103
(215) 299-5400
 - e) Specification for Encapsulants for Friable Asbestos-Containing Building Materials
 - f) Safety and Health Requirements Relating to Occupational Exposure to Asbestos

- K. the Owner's Representative
1. the Owner's Representative is authorized by the Owner to perform the following:
 - a. Have free access to all asbestos work areas.
 - b. To assist in interpretation of procedures.
 - c. To advise on all provisions of the contract documents pertaining to the control of asbestos.
 - d. To stop work if, in the course of performing their monitoring duties, an instance of substantial nonconformance with the contract documents is observed.
 - e. To stop work if a situation presenting a health hazard to workers or the Owner's employees or occupants of the building is observed.
 - f. To act as the Owner's liaison in technical matters involving the asbestos-related work.
 - g. To perform air sampling inside and outside the asbestos work area during the project. The Contractor shall cooperate fully with the Owner's Representative, its agents and employees, and ensure cooperation of its workers during collection of air samples and work area inspections.
 - h. the Owner's Representative role in advising the Owner on environmental health matters does not relieve the Contractor's obligation to comply with all applicable health and safety regulations. Air monitoring results generated by the Owner's Representative shall not be used by the Contractor to represent compliance with regulatory agency requirements for monitoring of worker's exposure to airborne asbestos, nor shall any other activity on the part of the Owner's Representative represent the Contractor's compliance with applicable health and safety regulations.
- L. Pre-Construction Conference
1. An initial progress meeting recognized as "Pre-Construction Conference" shall be held prior to start of any work. Contractor shall meet at project site, with General Superintendent, the Owner, the Owner's Representative, and other entities concerned with asbestos abatement work. Record discussions and agreements and furnish copy to each participant. Provide at least 72 hours advance notice to all participants prior to convening Pre-Construction Conference.
 2. This is an organizational meeting, to review responsibilities and personnel assignments, to locate the containment and decontamination areas; and temporary facilities including power, light, water, etc.
 3. Submit waivers on forms, and executed in a manner acceptable to the Owner. Administrative requirements that must proceed or coincide with Contractor's submittal for final payment shall consist of the following:
 - a. Completion of project closeout requirements.
 - b. Completion of items specified for completion beyond time of Final Completion (regardless of whether special payment application was previously made).
 - c. Assurance, satisfactory to the Owner, that unsettled claims will be settled and that work not actually completed and accepted will be completed without undue delay.
 - d. Transmittal of required project construction records to the Owner.
 - e. Landfill receipts for all asbestos-containing material.
 - f. Proof, satisfactory to the Owner, that taxes, fees and similar obligations of Contractor have been paid.
 - g. Removal of temporary facilities, services, surplus materials, rubbish and similar elements.
 - h. Consent of surety for final payment.
- M. Project Closeout
1. Project closeout is the term used to describe certain collective project requirements that indicate completion of the work to be fulfilled near the end of the contract time. Also, in preparation for final acceptance of the work by the Owner, as well as, final payment to the Contractor and the normal termination of the Contract.
 2. Include supporting documentation for completion as indicated in these contract documents.
 3. Submit a statement on accounting of changes to the Contract Sum.
 4. Advise the Owner of pending insurance change-over requirements.

5. Submit specific warranties, workmanship and maintenance bonds, maintenance agreements, final certifications and similar documents.
6. Obtain and submit releases enabling the Owner's full, unrestricted use of the work area and access to services and utilities. Where required, include occupancy permits, operating certificates and similar releases.
7. Results of the completed inspection will form the initial "punch-list" for final acceptance.
8. A complete record, certified by the testing laboratory, of all personal air monitoring results.
9. Complete the following cleaning operations as outlined in Paragraph "Decontamination Procedures" before requesting the Owner's Representative inspection for certification of Final Completion.
 - a. Remove exposed labels in finished spaces which are not required as permanent labels on materials supplied as part of the work, except for "Asbestos", "Asbestos Free", or Thermal Insulation Labels specified elsewhere.
 - b. Clean transparent materials, affected by the work including mirrors and window/door glass, to a polished condition, removing substances which are noticeably vision-obscuring materials. Replace broken glass and damaged transparent materials.
 - c. Clean exposed hard-surfaced finishes affected by the work, to a dirt-free condition, free of dust, stains, films and similar distracting substances. Except as otherwise indicated, avoid disturbance of natural weathering of exterior surfaces. Restore reflective surfaces to original reflective condition.
 - d. Clean plumbing fixtures affected by the work to a sanitary condition, free of stains including those resulting from water exposure.
 - e. Replace all HVAC filters using materials supplied by the Owner or clean non-replaceable filters after minimum of two days of operation of HVAC equipment.
 - f. Clean light fixtures and lamps, which have been affected by the work so as to function with full efficiency. Replace lamps where inoperable.
 - g. Repair any damage to wall, ceiling and floor surfaces caused by installation and removal of the polyethylene sheeting.

N. Personnel Protection

1. Prior to commencement of work, the workers shall be instructed and be knowledgeable in the areas described in Paragraph "Submittals and Notices" having to do with employees.
2. Worker Protection - shall comply with 29 CFR 1910.134 (Respiratory Protection).
 - a. Because there is no known safe level of exposure to asbestos, it is prudent to reduce worker's exposures to as low a level as possible. Proper respiratory protection is critical in minimizing exposure.
 - b. Workers shall be provided, as a minimum, with personally issued and marked respirators equipped with high efficiency particulate filters approved by NIOSH to be worn in the designated work area and/or whenever a potential exposure to asbestos exists. Sufficient filters shall be provided for replacement as required by the workers or applicable regulations. Disposable respirators shall not be used.
 - c. No worker shall be exposed to levels greater than 0.01 f/cc as determined by the protection factor of the respirator worn and the work area fiber levels.
 - d. Whenever powered purifying respirator protection is used, a sufficient supply of replacement batteries and HEPA filter cartridges shall be provided to the workers.
 - e. Air monitoring required by OSHA is work of the Contractor and not covered in this specification. Contractor shall post, on a daily basis, results of the air monitoring results from the previous shift. A complete record, certified by the testing laboratory, of all personal air monitoring tests and results will be furnished to the Owner and the Owner's Representative prior to Contractor's Request for Final Payment.
 - f. During encapsulation operations or usage of other organic base aerosols (e.g., spray glue, expanding foam), workers shall be provided with combination cartridges consisting of organic vapor and HEPA sections.

- g. Workers shall be provided with sufficient sets of protective full-body clothing to be worn in the designated work area and/or whenever potential exposure to asbestos exists. Such clothing shall include, but not be limited to, full-body coveralls, headgear and gloves. Workers shall assure that hoods covering their hair are worn in the designated work areas at all times. Eye protection and hard hats shall be provided as required by applicable safety regulations. Eye protection shall be worn during encapsulation operations. Non-disposable type protective clothing and footwear shall be left in the work area until the end of the asbestos abatement work, at which time such items will be disposed of as asbestos waste.
 - h. Non-skid footwear shall be provided to all abatement workers. Disposable clothing shall be adequately sealed to the footwear to prevent body contamination.
 - i. Protective clothing shall not be worn in lieu of street clothing outside the work area.
 - j. Visitor Clothing: The Contractor shall provide authorized visitors with suitable respirator, protective clothing, headgear, eye protection, and footwear as described herein, whenever they enter the work area.
3. Decontamination and Work Procedures: The decontamination and work procedures to be followed by workers shall be posted as described in these specifications.
4. Worker and Authorized Visitor Protection Procedures:
- a. Each worker and authorized visitor shall, upon entering the job site, remove street clothes in a designated clean change area and put on a respirator with new filters and clean protective clothing before entering the work area.
 - b. The Contractor's employees shall perform a positive/negative respirator fit test each time it enters the work area. If leakage occurs, the respirator must be re-adjusted or replaced.
 - c. Workers shall maintain their respirators in a safe operating condition. The condition of respirators shall be checked daily.
 - d. Workers and visitors shall complete the decontamination procedures as outlined in the specification upon exiting the work area.
 - e. Workers shall not eat, drink, smoke, or chew gum or tobacco in or near the asbestos work areas.
 - f. Workers shall be fully protected with respirators and protective clothing immediately prior to the first disturbance of asbestos-containing or contaminated materials and until final cleanup is completed.
- O. Air Monitoring
- 1. The airborne fiber counts outside the work area will be monitored to detect faults in the work area isolation such as contamination of the building outside of the work areas with airborne asbestos fibers, failure of filtration or rupture in the negative pressure system. Should any of the above occur, the Contractor shall immediately cease asbestos abatement activities until the fault is corrected. Work shall not recommence until authorized by the Owner's Representative. In the case of mini-enclosures the Owner's Representative will monitor air in a remote location of the residence to determine the baseline of asbestos.
 - 2. The airborne fiber counts in the work area will be monitored. The purpose of this air monitoring will be to detect airborne fiber counts which may significantly challenge the ability of the work area isolation procedures to protect the balance of the building or outside of the building from contamination by airborne fibers. In the case of mini-enclosures the Owner's representative may monitor air outside of several enclosures if they are in close proximity.
 - 3. Contractor shall maintain an average airborne count inside the work area of less than 0.5 f/cc. If the fiber counts rise above this figure for any sample taken, revise work procedures to lower fiber counts. If the TWA fiber count for any work shift or eight-hour period exceeds 0.5 f/cc, stop all work, leave pressure differential system in operation and notify the Owner's Representative. Do not recommence work until authorized in writing by the Owner's Representative.
 - 4. If airborne fiber counts exceed 1.0 f/cc for any period of time cease all work until fiber counts fall below 0.5 f/cc and notify the Owner's Representative. Do not recommence work until authorized in writing by the Owner's Representative.

5. If any air sample taken outside of the work area exceeds the 0.01 f/cc of air, Contractor shall immediately and automatically stop all work. If this air sample was taken inside the building and outside of critical barriers around the work area, immediately erect new critical barriers to isolate the affected area from the balance of the building. Erect Critical Barriers at the next existing structural isolation of the involved space (e.g., wall, ceiling, and floor). Leave Critical Barriers in place until completion of work and insure that the operation of the negative pressure system in the work area results in a flow of air from the balance of the building into the affected area.
6. If the exit from the clean room of the personnel decontamination unit enters the affected area, establish a temporary decontamination facility consisting of a shower room and changing room. After cleaning and decontamination of the affected area remove the shower room and leave the changing room in place as an air lock.
7. After certification of visual inspection in the work area, remove critical barriers separating the work area from the affected area. Final air samples will be taken within the entire area.
8. The following procedure will be used to resolve any disputes regarding fiber types when a project has been stopped due to excessive airborne fiber counts. "Airborne Fibers" referred to above include all fibers regardless of composition as counted in the Phase Contrast Microscopy (PCM) NIOSH 7400 Method procedures. If work has stopped due to high airborne fiber counts, air samples will be secured in the same area by the Owner's Representative for analysis by electron microscopy. "Airborne fibers" counted in samples analyzed by Scanning or Transmission Electron Microscopy (TEM) shall be only asbestos fibers, but of any diameter and length. Subsequent to analysis by Electron Microscopy the number of airborne fibers shall be determined by multiplying the number of fibers, regardless of composition, counted by the PCM NIOSH 7400 Method procedure by a number equal to asbestos fibers counted divided by all fibers counted in the electron microscopy analysis.
9. If electron microscopy is used to arrive at the basis for determining airborne fiber counts in accordance with the above paragraph, and if the average of airborne asbestos fibers in all samples taken exceeds 0.1 f/cc, or if any one sample exceeds 0.2 f/cc, then the cost of such analysis will be born by the Contractor, at no additional cost to the Owner.
10. the Owner's Representative will secure at least the following air samples to establish a base line before start of work involving large enclosures:

Location Sampled	Number of Samples	Analysis Method	Detection Limit f/cc	Minimum Volume Liters	Rate LPM
Each Work Area	1	PCM	0.01	1,900	2-16
Outside Each Work Area	1-3	PCM	0.01	1,900	2-16

11. Base Line is an action level expressed in f/cc, which is ten percent greater than the largest of the following:
 - a. Average of the samples collected on cellulose ester filters outside each work area.
 - b. Average of the samples collected on cellulose ester filters outside the building.
 - c. 0.01 fibers per cubic centimeter.
12. Daily: From start of work of Paragraph "Temporary Enclosure" through the work of Paragraph "Project Decontamination," the Owner may be taking the following samples on a daily basis. The location of each air sample will be determined by the Owner's Representative.
 - a. Baseline
 - b. Work Area
13. For larger enclosures samples will be collected on 25 mm cassettes with the following filter media:

PCM: 0.8 micrometer mixed cellulose ester.

Location Sampled	Number of Samples	Analysis Method	Detection Limit f/cc	Minimum Volume Liters	Rate LPM
------------------	-------------------	-----------------	----------------------	-----------------------	----------

Each Work Area	2	PCM	0.01	1,900 as required by conditions	2-16
Outside Each Work Area Critical Barrier	1	PCM	0.01	1,900	2-16
Clean Room	1	PCM	0.01	1,900	2-16
Equip Decon	1	PCM	0.01	1,900	2-16

14. Additional samples may be taken at the Owner or the Owner's Representative discretion. If airborne fiber counts exceed allowed limits, additional samples will be taken as necessary to monitor fiber levels.
15. The services of a testing laboratory will be employed by the Owner to perform laboratory analysis of the air samples. Samples will be sent daily so that verbal reports on air samples can be obtained in a timely manner. A complete record, certified by the testing laboratory, of all air monitoring tests and results will be furnished to the Owner's Representative, the Owner and the Contractor.
16. Air samples may be analyzed on site by the Owner's Representative, if they are to be analyzed by the NIOSH 7400 Method.
17. Cellulose ester filters will be analyzed using the PCM NIOSH 7400 Method. Thus analysis will be carried out at a laboratory located off the job site.
18. At the completion of the work in occupied areas and prior to the dismantling of the isolation system, final air clearance will be conducted by the Owner's Representative.
19. Decontamination of the work area will be considered complete when all samples indicate fiber levels are less than 0.01 f/cc of air as analyzed by PCM NIOSH 7400 Method or an average of less than 70 structures per square millimeter of filter area as analyzed by TEM; Level II AHERA Method.
20. The Contractor may conduct its own air monitoring and laboratory testing. If it elects to do this the cost of such air monitoring and laboratory testing shall be included in the Contract Sum.

P. Equipment Removal Procedures

1. Clean all external surfaces of contaminated waste containers and equipment thoroughly by wet sponging or HEPA vacuuming before moving such items into the equipment decontamination enclosure system washroom for final cleaning and removal to uncontaminated areas. Ensure that personnel do not leave the work areas through the equipment decontamination enclosure system.

Q. Disposal Activities

1. It is the responsibility of the Contractor to comply with current federal, state and local regulations concerning the waste handling, transportation, and disposal of asbestos-containing material (ACM) and accompanying solvents or residues.
2. The Contractor will document actual disposal of the waste at the designated landfill by completing Disposal Certificate or submitting proof of landfill receipt.

1.2 PRODUCTS

A. Materials

1. All Contractor's equipment delivered to the site shall be free of asbestos contamination.
2. Store all materials subject to damage off the ground, away from wet or damp surfaces, and under cover sufficient to prevent damage or contamination.
3. Damaged or deteriorating materials shall not be used and shall be removed from the premises. Materials that become contaminated shall be disposed of in accordance with applicable regulations.

4. Polyethylene flame retardant sheet of 6-mil thickness shall be used unless otherwise specified. Polyethylene sheeting shall be sized to minimize the frequency of joints. Polyethylene sheeting must satisfy the National Fire Prevention Association Standard 701, "Small Scale Fire Test for Flame Resistant Textile and Film."
5. Adhesive tape shall be capable of sealing joints of adjacent sheets of polyethylene and for use in attachment of polyethylene sheet to finished or unfinished surfaces of similar materials and shall be capable of adhering under dry and wet conditions, including use of amended water. Contractor shall use adhesive tape compatible with finished surfaces.
6. Protective devices such as, but not limited to, disposable clothing, respirators, gloves, hard hats, etc. shall be used.
7. Wetting agent shall be a mixture of 50/50 polyoxyethylene ether and polyglycol ester or equivalent commercial product.
8. Encapsulant materials shall be the bridging and penetrating type and conform with the following characteristics:
 - a. Encapsulants shall not be solvent-based or utilize a hydrocarbon in the liquid in which the solid parts of the encapsulant are suspended.
 - b. Encapsulant shall not be flammable.
9. A non-hardening lagging sealer for enclosing and sealing raw exposed edges and surfaces of asbestos-containing materials.
10. Pre-mixed or job mixed insulating plaster manufactured for use on plumbing equipment shall be used when repairing damaged thermal insulation material.
11. Non-woven fibrous glass mat and open weave glass fiber mat cloth for repair of thermal systems insulation.
12. Fire retardant sealant shall prevent fire, smoke, water and toxic fumes from penetrating through sealants. Sealant shall have a flame spread, smoke and fuel contribution of zero, and shall be ASTM and Underwriter's Laboratory (UL) rated for three hours for standard method of fire test for fire stop systems.

B. Tools And Equipment

1. Provide suitable tools for repair and encapsulation of asbestos-containing materials and for removal of asbestos-containing materials that are beyond repair. Wire brushes shall not be used as a means of removing or cleaning asbestos-containing materials from surfaces, if they are used as the surface is being sprayed with water or amended water.
2. Provide sufficient number of HEPA-filtered vacuum cleaners equipped with pick-up adapters, steel floor wands, crevice tools, and carpet tools.
3. Airless sprayers capable of spraying amended water shall be provided in sufficient number to allow continuous uninterrupted work.
4. Asbestos filtration devices shall utilize high efficiency particulate air (HEPA) filtration systems.
5. Transportation equipment, as required, shall be suitable for loading, temporary storage, and unloading of contaminated waste without exposure to persons or property, and shall be quiet in motion if used within the building.

1.3 EXECUTION

A. Safety Procedures For Power And Lighting

1. The use of wet methods for removal, repair, encapsulation or cleaning procedures increases the potential for electrical shock when working around electrical panels, conduit, light fixtures, alarm systems, junction boxes, transformers, etc. In coordination with the Owner, de-energize as much electrical equipment as possible to prevent electrical shock to employees performing the work. The Contractor shall use the following precautions:
 - a. Use non-conductive tools and vacuum attachments.
 - b. Utilize "hot line" covers over energized cables and power lines when possible.

- c. Ensure all electrical equipment in use is properly grounded before the job starts. Check outlets, wiring, extension cords and power pickups.
- d. Avoid stringing wiring across floors. Elevate wiring if possible.
- e. Ensure electrical outlets are tightly sealed and taped to avoid water spray.
- f. Determine operating voltages of equipment and lines before working on or near energized parts.
- g. Energized parts must be insulated or guarded from employee contact and other conductive objects. Extension cords must be three-wire type and connected to a Ground Fault Interrupter (GFI) circuit.
- h. Lock or secure de-energized circuits at panel and post warning signs.
- i. Seal heating vents with two layers of polyethylene sheeting prior to the start of work. The Contractor shall repair any damage caused by Contractor's operations to duct work, grilles, dampers, louvers or HVAC equipment at the completion of the work at Contractor's expense. Coordinate all lock out and or de-energizing with the Owner.

B. Temporary Facilities

1. Use qualified tradesmen for installation of temporary services and facilities. Locate temporary services and facilities where they will serve the entire project adequately and result in minimum interference with the performance of the work and operations of the building. Coordinate all installations and shut downs with building owner.
2. Relocate, modify and extend services and facilities as required during the course of work so as to accommodate the entire work of the project.
3. Provide new or used materials and equipment that are undamaged and in serviceable condition. Provide only materials and equipment that are recognized as being suitable for the intended use, by compliance with appropriate standards.
4. During the erection and/or moving of scaffolding, care must be exercised so that the polyethylene floor covering is not damaged.
5. Clean, as necessary, debris from non-slip surfaces.
6. At the completion of abatement work, clean all construction aids within the work area, wrap in one layer of 6-mil polyethylene sheet and seal before removal from the work area.
7. Temporary water service connections to the Owner's water system shall include back flow protection. Valves shall be temperature and pressure rated for operation of the temperatures and pressures encountered.
8. Employ heavy-duty abrasion-resistant hoses with a pressure rating 50 percent greater than the maximum pressure of the water distribution system to provide water into each work area and to each Decontamination Unit. Provide fittings as required to allow for connection to existing wall hydrants or spouts, as well as temporary water heating equipment, branch piping, showers, shut-off nozzles and equipment.
9. Electrical Services shall comply with applicable NEMA, NECA and UL standards and governing regulations for materials and layout of temporary electric service.
10. Provide a weatherproof, grounded temporary electric power service and distribution system of sufficient size, capacity, and power characteristics to accommodate performance of work during the construction period. Install temporary lighting adequate to provide sufficient illumination for safe work and traffic conditions in every area of work.
11. Provide receptacle outlets equipped with ground fault circuit interrupters, reset button and pilot light, for plug-in connection of power tools and equipment.
12. Use only grounded extension cords; use "hard-service" cords where exposed to abrasion and traffic. Use single lengths or use waterproof connectors to connect separate lengths of electric cords, if single lengths will not reach areas of work. All cords shall be elevated off the floor inside the containment area.
13. Temporary wiring in the work area shall be type UL non-metallic sheathed cable located overhead and exposed for surveillance. Do not wire temporary lighting with plain, exposed (insulated) electrical conductors. Provide liquid tight enclosures or boxes for wiring devices.

14. Provide Type "A" fire extinguishers for temporary offices and similar spaces where there is minimal danger of electrical or grease-oil-flammable liquid fires. In other locations provide type "ABC" dry chemical extinguishers, or a combination of several extinguishers of NFPA recommended types for the exposures in each case.
15. Use of the Owner's existing toilet facilities, as indicated, will be permitted, so long as these facilities are properly cleaned and maintained in a condition acceptable to the Owner. At Final Completion, restore these facilities to the condition prevalent at the time of initial use. All provisions of these specifications regarding leaving the work area must be met.
16. When mini-enclosures area being used all of the requirements above will be enforced by the Owner's Representative. The construction and set-up of the mini-enclosures may be done by the Abatement Contractor.

C. Pressure Differential System

1. Before start of work Contractor shall submit design of pressure differential system to the Owner's Representative for review. Do not begin work until system has been approved by the Owner's Representative. Include in the submittal the following:
 - a. Number of pressure differential machines required and the calculations necessary to determine the number of machines.
 - b. Description of projected air-flow within work area and methods required to provide adequate air flow in all portions of the work area.
2. If the enclosure is not a mini-enclosure, the Contractor must supply the required number of asbestos air filtration units to the site in accordance with these specifications. Each unit shall include the following:
 - a. Cabinet constructed of steel or other durable materials able to withstand damage from rough handling and transportation. The width of the cabinet should be less than 30 inches to fit through standard-size doorways. Cabinet shall be factory sealed to prevent asbestos-containing dust from being released during use, transport, or maintenance. Access to and replacement of all air filters shall be from intake end. Unit shall be mounted on casters or wheels.
 - b. Rate capacity of fan according to useable air-moving capacity under actual operating conditions. Use centrifugal-type fan.
 - c. The final filter shall be the HEPA type. The filter media (folded into closely pleated panels) must be completely sealed on all edges with a structurally rigid frame.
 - d. A continuous rubber gasket shall be located between the filter and the filter housing to form a tight seal.
 - e. Provide HEPA Units that are individually tested and certified on site by an independent testing agency to have an efficiency of not less than 99.97 percent when challenged with 0.3 m dioctylphthlaate (DOP) particles when tested in accordance with Military Standard Number 2182 and Army Instruction Manual 136-300-175A. Provide filters that bear a UL586 label to indicate ability to perform under specified conditions.
 - f. Pre-filters, which protect the final filter by removing the larger particles, are required to prolong the operating life of the HEPA filter. Two stages of pre-filtration are required. The first-stage pre-filter shall be a low-efficiency type (e.g., for particles 10 microns and larger). The second-stage (or intermediate) filter shall have a medium efficiency (e.g., effective for particles down to 5 microns). Pre-filters and intermediate filters shall be installed either on or in the intake grid of the unit and held in place with special housings or clamps.
 - g. Each unit shall be equipped with a Magnahelic gauge or manometer to measure the pressure drop across filters and indicate when filters have become loaded and need to be changed. A table indicating the useable air-handling capacity for various static pressure readings on the Magnahelic gauge shall be affixed near the gauge for reference, or the Magnahelic reading indicating at what point the filters should be changed, noting Cubic Feet per Minute (CFM) air delivery at that point. Provide units equipped with an elapsed time meter to show the total accumulated hours of operation.

- e. Use a differential pressure meter or manometer to demonstrate a pressure difference of at least 0.02 inches (as allowed) of water across every barrier separating the work area from the balance of the building or outside. This is not required in the case of a mini enclosure.
 14. Start exhaust units before beginning work (before any asbestos-containing material is disturbed). After abatement work has begun, run units continuously to maintain a constant negative pressure until decontamination of the work area is complete. Do not turn off units at the end of the work shift or when abatement operations temporarily stop.
 15. Do not shut down pressure differential system during encapsulating procedures, unless authorized by the Owner's Representative in writing. Start abatement work at a location farthest from the exhaust units and proceed toward them. If an electric power failure occurs, immediately stop all abatement work and do not resume until power is restored and exhaust units are operating again.
 16. At completion of abatement work, allow exhaust units to run as specified to remove airborne fibers that may have been generated during abatement work and cleanup and to purge the work area with clean makeup air. The units may be required to run for a longer time after decontamination, if dry or only partially wetted asbestos material was encountered during any abatement work. In the case of a mini-enclosure the vacuum may be removed and the entrance sealed following encapsulation until the clearance sample is collected.
 17. Prior to final air test, remove pre-filter and wipe out inside lip of negative air machine.
 18. When a final inspection and the results of final air tests indicate that the area has been decontaminated, exhaust units may be removed from the work area. Before removal from the work area, remove and properly dispose of pre-filter, and seal Intake to the machine with 6-mil polyethylene to prevent environmental contamination from the filters.
- D. Work Area Preparation
1. The work area is the location where asbestos-abatement work occurs. It is a variable of the extent of work of the contract. It may be a portion of a room, a single room, or a complex of rooms. A "work area" is considered contaminated during the work, and must be isolated from the balance of the building, and decontaminated at the completion of the asbestos-control work.
 2. Pre-clean fixed objects, walls and floor surfaces within the proposed work areas using HEPA filtered vacuum equipment and wet cleaning methods as appropriate.
 3. Seal all openings, supply and exhaust vents, and convectors within ten feet of the work area with 6-mil polyethylene sheeting secured and completely sealed with plastic adhesion tape.
 4. Contact fire control agencies to review procedures prior to start of work.
 5. Provide flame resistant polyethylene sheeting that conforms to requirements set forth by the National Fire Protection Association Standard 701, Small Scale Fire Test for Flame-resistant Textiles and Films. Provide largest size possible to minimize seams, four- or six- mils thick, frosted or black.
 6. Provide spray adhesive in aerosol cans which is specifically formulated to stick tenaciously to sheet polyethylene and supporting surface.
 7. Completely isolate the work area from other parts of the building so as to prevent asbestos-containing dust or debris from passing beyond the isolated area. Should the area beyond the work area(s) become contaminated with asbestos-containing dust or debris as a consequence of the work, clean those areas in accordance with the procedures indicated in Paragraph "Decontamination Procedures." All such required cleaning or decontamination shall be performed at no additional cost to the Owner.
 8. Place all tools (i.e., scaffolding, staging) necessary for the work in the area to be isolated prior to erection of plastic sheeting temporary enclosure.
 9. Disable ventilation systems or any other system bringing air into or out of the work area. Disable system by disconnecting wires, removing circuit breakers, by lockable switch or other positive means that will prevent accidental premature restarting of equipment.
 10. Remove and dispose of all electrical and mechanical items, such as lighting fixtures, clocks, diffusers, registers, escutcheon plates, etc., which cover any part of the surface on which work is to be performed.

11. All general construction items such as cabinets, casework, doors and window trim, moldings, ceilings, trim, etc., which cover the surface of the work as required to prevent interference with the work. To be performed by the Owner: clean, decontaminate and reinstall all such materials, upon completion of all removal work with materials, finishes, and workmanship to match existing installations before start of work.
12. Permit Access to the work area only through the Decontamination Unit. All other means of access shall be closed off and sealed and warning signs displayed on the clean side of the sealed access.
13. Provide Warning Signs at each visual and physical barriers reading as follows in both English and Spanish:

Legend	Notation
KEEP OUT	3" Sans Serif Gothic or Block
BEYOND THIS POINT	1" Sans Serif Gothic or Block
ASBESTOS ABATEMENT WORK	1" Sans Serif Gothic or Block
IN PROGRESS	1" Sans Serif Gothic or Block
BREATHING ASBESTOS DUST MAY BE HAZARDOUS TO YOUR HEALTH	14 Point Gothic

14. Alternate methods of containing the work area may be submitted to the Owner's Representative for approval. Do not proceed with any such method(s) without prior written approval of the Owner's Representative.
15. Individually seal all ventilation openings (supply and exhaust), lighting fixtures, clocks, doorways, windows, convectors and speakers, and other openings into the work area with plastic adhesion tape alone or with polyethylene sheeting at least 4-mil in thickness, taped securely in place with plastic adhesion tape. Maintain seal until all work including Project Decontamination is completed. Take care in sealing off lighting fixtures to avoid melting or burning of sheeting.
16. Provide sheet plastic barriers at least 6-mil in thickness as required to completely seal openings from the work area into adjacent areas. Seal the perimeter of all sheet plastic barriers with plastic adhesion tape or spray cement.
17. Where applicable, construct framing of the containment out of fire treated wood or aluminum studs. Mini-enclosure frames may be constructed of Polyvinyl Chloride (PVC) tubing.
18. Cover all walls in work area extending to the underside of the ceiling grid system with one layer of polyethylene sheeting, at least 6-mil in thickness, mechanically supported and sealed with plastic adhesion tape or spray-glue in the same manner as "Critical Barrier" sheet plastic barriers. Tape all joints with plastic adhesion tape. Contractor shall be responsible for repair of damaged wall finishes.
19. Cover floor with two layers of 6-mil polyethylene sheeting (exclude for floor tile and adhesive).
20. Provide Pressure Differential System per Paragraph "Pressure Differential System."
21. If the enclosure barrier is breached in any manner that could allow the passage of asbestos debris or airborne fibers, then add the affected area to the work area, enclose it as required by this section of the specification and decontaminate it as described in Paragraph "Decontamination Procedures."
22. Establishing a Mini-Containment area:
 - a. Establish work area so that unauthorized entry is prevented; Construct a two-compartment fire treated wood frame around work area; install one layer 6-mil polyethylene sheeting to structural members and two layers 6 mil polyethylene sheeting to the floor. Exception: no floor required if mini-containment is being constructed to perform a floor tile activity. Seal all edges to wall, ceiling, and floor surfaces with duct tape. Install viewing inspection windows, where feasible.
 - b. Seal all penetrations with duct tape such as pipes, electrical conduit, or ducts contained within the mini-containment.

- c. Install triple 6-mil polyethylene flaps at both doorways. Place portable sprayer with clean water, disposable towels, and pre-labeled disposal bag in air lock.
- d. Install appropriate signs on outside of mini-containment area.
- e. Install HEPA vacuum; extend hose into mini-containment area for general vacuuming, negative air, and cleaning of disposal suit.
- f. Accumulate all loose materials for disposal. Place in approved container. Apply appropriate labels. Adequately wet clean all wall, floor, tool and equipment surfaces.
- g. Abatement worker must wear two disposable suits. Remove outer suit in work area and place in a plastic bag. Enter air lock.
- h. In air lock, wet wipe respirator and wash hands with clean water. Remove respirator and place in a clean plastic bag. Proceed to remote shower unit where inner suit may be removed.

E. Worker Protection

1. This section describes the equipment and procedures required for protecting workers against asbestos contamination and other work place hazards except for respiratory protection.
2. Respiratory Protection is specified in Paragraph "Respiratory Protection."
3. Train in accordance with EPA's Model Accreditation Plan, 40 CFR 763 - Asbestos, all workers in the dangers inherent in handling asbestos and breathing asbestos dust and in proper work procedures and personal and area protective measures. Include but do not limit the topics covered in the course to the following:
 - a. Methods of recognizing asbestos.
 - b. Health effects associated with asbestos.
 - c. Relationship between smoking and asbestos in producing lung cancer.
 - d. Nature of operations that could result in exposure to asbestos.
4. Importance of and instruction in the use of necessary protective controls, practices and procedures to minimize exposure including:

Engineering controls

Work practices

Respirators

Housekeeping procedures

Hygiene facilities

Protective clothing

Decontamination procedures

Emergency procedures

Waste disposal procedures

Appropriate work practices for the work

Requirements of medical surveillance program

Review of OSHA 29 CFR 1926.1101(k)(9)(viii)(G) - Asbestos

Pressure differential systems

Work practices including hands on or on job training

Personal decontamination procedures

Air monitoring, personal and area

5. Provide medical examinations for all workers who may encounter an airborne fiber level of 0.1 f/cc or greater for an 8 hour time weighted average. In the absence of specific airborne fiber data, provide medical examination for all workers who will enter the work area for any reason. Examination shall, at minimum, meet OSHA requirements as set forth in 29 CFR 1926.1101(k)(9)(viii)(G) - Asbestos. In addition, provide an evaluation of the individual's ability to work in environments capable of producing heat stress in the worker.
6. Before start of work Contractor shall submit the following to the Owner's Representative for review. Do not start work until receipt of the Owner's Representative.

- a. An original signed copy of the Certificate of Worker's Acknowledgement found at the end of this specification, for each worker who is to be at the job site or enter the work area.
 - b. Courses outline or name of institution providing the worker training course.
 - c. Report from medical examination conducted within last 12 months as part of compliance with OSHA medical surveillance requirements for each worker who is to enter the work area.
7. Provide disposable full-body coveralls and disposable head covers, and require that they be worn by all workers in the work area. Provide a sufficient number for all required changes, for all workers in the work area.
 8. Provide work boots with non-skid soles, and where required by OSHA, foot protectives, for all workers. Provide boots at no cost to workers. Paint uppers of all boots red with water proof enamel. Do not allow boots to be removed from the work area for any reason, after being contaminated with asbestos-containing material. Dispose of boots as asbestos contaminated waste at the end of the work.
 9. Provide head protectives (hard hats) as required by OSHA for all workers, and provide four spares for use by the Owner's Representative, and the Owner. Label hats with same warning labels as used on disposal bags. Require hard hats to be worn at all times that work is in progress that may potentially cause head injury. Provide hard hats with plastic strap type suspension. Require hats to remain in the work area throughout the work. Thoroughly clean, decontaminate and bag hats before removing them from work area at the end of the work.
 10. Provide eye protectives (goggles) as required by OSHA for all workers involved in scraping, spraying, or any other activity which may potentially cause eye injury.
 11. Provide work gloves to all workers and require that they be worn at all times in the work area. Do not remove gloves from work area. Dispose of gloves as asbestos contaminated waste at the end of the work.
 12. Respirators, disposable coveralls, head covers, and footwear covers shall be provided by the contractor for the Owner, the Owner's Representative, and other authorized representatives who may inspect the job site.
 13. Provide worker protection as required by the most stringent OSHA and/or EPA standards applicable to the work. The following procedures are minimums to be adhered to regardless of fiber count in the work area.
 14. Each time work is entered, remove all street clothes in the changing room of the Personnel Decontamination Unit and put on new disposable coverall, new head cover, and a clean respirator. Proceed through shower room to equipment room and put on work boots.
 15. In the event a mini-enclosure is used refer to Paragraph "Work Area Preparation" for personal decontamination procedures.
- F. Respiratory Protection
1. Instruct and train each worker involved in asbestos abatement or maintenance and repair of friable asbestos-containing materials in proper respiratory use and require that each worker always wear a respirator, properly fitted on the face in the work area from the start of any operation which may cause airborne asbestos fibers until the work area is completely decontaminated. Use respiratory protection appropriate for the fiber level encountered in the work place or as required for other toxic or oxygen-deficient situations encountered.
 2. Except to the extent that more stringent requirements are written directly into the Contract Documents, the following regulations and standards have the same force and effect (and are made a part of the Contract Documents by reference) as if copied directly into the Contract Documents, or as if published copies were bound herewith. Where there is a conflict in requirements set forth in these regulations and standards meet the more stringent requirement.
 - a. OSHA - U.S. Department of Labor Occupational Safety and Health Administration, Safety and Health Standards 29 CFR 1910, Section 1001 and Section 1910.134.29 CFR 1926.
 - b. ANSI - American National Standard Practices for Respiratory Protection. ANSI Z88.2-1980.
 - c. NIOSH - National Institute for Occupational Safety and Health.

d. MSHA - Mine Safety and Health Administration.

G. Type Of Respiratory Protection Required

1. Provide Respiratory Protection as indicated in paragraph below. Where paragraph below does not apply, determine the proper level of protection by dividing the expected or actual airborne fiber count in the work area by the "protection factors" given below. The level of respiratory protection which supplies an airborne fiber level inside the respirator, at the breathing zone of the wearer, at or below 0.01 fibers/cubic centimeter is the minimum level of protection allowed.
2. Eight-hour Time Weighted Average (TWA) of asbestos fibers to which any worker may be exposed shall not exceed 0.1 fibers/cubic centimeter.
3. For purposes of this section fibers are defined as all fibers regardless of composition as counted in the OSHA Reference Method (ORM), NIOSH P&CAM 239 or 7400 procedure, or asbestos fibers of any size as counted using either a scanning or transmission electron microscope.
4. Require that respiratory protection be used at all times that there is any possibility of disturbance of asbestos-containing materials whether intentional or accidental.
5. Require that a respirator be worn by anyone in a work area at all times, regardless of activity, during a period that starts with any operation which could cause airborne fibers until the area has been cleared for re-occupancy.

H. Respiratory Protection Factor

<u>Respirator Type</u>	<u>Protection Factor</u>
Air purifying: Negative pressure respirator High efficiency filter Half facepiece	10
Air purifying: Negative pressure respirator High efficiency filter Full facepiece	50
Powered-air purifying (PAPR): Positive pressure respirator High efficiency filter Half or Full facepiece	100
Type C supplied air: Positive pressure respirator continuous-flow Half or full facepiece	100
Type C supplied air: Positive pressure respirator pressure demand Full facepiece	1000
Type C supplied air: Positive pressure respirator pressure demand Full facepiece Equipped with an auxiliary positive pressure Self-contained breathing apparatus (SCBA)	over 1000
Self-contained breathing apparatus (SCBA): Positive Pressure respirator	over 1000

Pressure demand
Full facepiece

- I. Air Purifying Respirator
 1. Provide half face or full face type respirators. Equip full-face respirators with a nose cup or other anti-fogging device as would be appropriate for use in air temperatures less than 32 degrees Fahrenheit.
 2. Provide, at a minimum, HEPA type filters labeled with NIOSH and MSHA certification for "Radionuclides, Radon Daughters, Dust, Fumes, Mists including Asbestos-Containing Dusts and Mists" and color coded in accordance with ANSI Z228.2 (1980). In addition, a chemical cartridge section may be added, if required, for solvents, etc., in use. In this case, provide cartridges that have each section of the combination canister labeled with the appropriate color code and NIOSH/MSHA Certification.
 3. Supply with a sufficient quantity of respirator filters approved for asbestos, so that workers can change filters during the work day. Require that respirators be wet-rinsed, and filters discarded, each time a worker leaves the work area. Require that new filters be installed each time a worker re-enters the work area. Store respirators and filters at the job site in the changing room and protect totally from exposure to asbestos prior to their use. Do not use single use, disposable or quarterface respirators.

- J. Powered Air Purifying Respirator (PAPR)
 1. Provide full-facepiece type respirators. Provide nose-cups for full-facepiece respirators. Provide, at a minimum, HEPA type cartridges approved by NIOSH/MSHA and certified for use in atmospheres containing asbestos dusts.
 2. Provide, at a minimum, one extra battery pack for each respirator so that one can be charging while one is in use.
 3. Provide non-cloth belts capable of being decontaminated in shower.
 4. Supply with a sufficient quantity of high efficiency respirator filters approved for asbestos so that workers can change filters at any time that flow through the face piece decreases to the level at which the manufacturer recommends filter replacement. Require that regardless of flow, filter cartridges be replaced after 40 hours of use. Require that HEPA elements in filter cartridges be protected from wetting during showering. Require entire exterior housing of respirator including blower unit, filter cartridges, hoses, battery pack, face mask, belt, and cords to be washed each time a worker leaves the work area. Caution should be used to avoid shorting battery pack during washing.

- K. Required Respiratory Protection
 1. Regardless of airborne fiber levels, require the following minimum level of respiratory protection:
 - a. Half-face air purifying respirators may be used during set-up of the containment and removal of the material so long as fiber counts inside the respirator do not exceed .01 f/cc fibers per cubic centimeter.

- L. Decontamination Units -Three-Stage
 1. Provide a Personnel Decontamination Unit consisting of a serial arrangement of rooms or spaces, Changing Room, Shower Room, Equipment Room adjacent to each full containment area.
 2. Require all persons without exception to pass through this decontamination unit for entry into and exiting from the work area for any purpose. Do not remove equipment or materials through Personnel Decontamination Unit.
 3. Changing (Clean) Room:
 - a. Provide a room that is physically and visually separated from the rest of the building for the purpose of changing into protective clothing.
 - b. Locate so that access to work area from changing room is through shower room.

- c. Separate changing room from the building by a double-sheeted polyethylene flapped doorway.
- d. Provide sub-panel at changing room to accommodate all removal equipment. Power sub-panel directly from a building electrical panel. Connect all electrical branch circuits in decontamination unit and particularly any pumps in shower room to a ground-fault circuit protection device.
4. Shower Room:
 - a. Provide a completely water tight operational shower to be used for transit by cleanly dressed workers heading for the work area from the changing room, or for showering by workers headed out of the work area after undressing in the equipment room.
 - b. Construct room by providing a shower pan and two shower walls in a configuration that will cause water running down walls to drip into pan. Install a freely draining wood floor in shower pan at elevation of top of pan.
 - c. Separate this room from rest of building, drying room and airlock with airtight walls fabricated of 6-mil polyethylene.
 - d. Provide splash proof entrances to Drying Room and Airlock.
5. Equipment Room (contaminated area):
 - a. Require work equipment, footwear and additional contaminated work clothing to be left here. This is a change and transit area for workers. Separate this room from the work area by a 6-mil polyethylene flap doorway.
 - b. Separate this room from the rest of the building, the shower room and work area with air tight walls fabricated of 6-mil polyethylene.
6. Clean Room: Provide Clean Room to isolate the holding room from the building exterior.
7. Load-out Area:
 - a. The load-out area is the transfer area from the building to a truck or dumpster.
 - b. Wet wipe bags before they are passed through the equipment decon-chamber.
 - c. When cleaning is complete pass items into holding room. Close all doorways except the doorway between the holding room and the Clean Room.
 - d. Workers from the area outside the containment area enter holding area and remove decontaminated equipment and/or containers for disposal.
 - e. Require these workers to wear full protective clothing and appropriate respiratory protection.
 - f. At no time is a worker from an uncontaminated area to enter the enclosure when a removal worker is inside.
 - g. Post an approximately 20 inch x 14 inch manufactured caution sign at each entrance to the work area displaying the following legend with letter sizes and styles of a visibility required by OSHA 29 CFR 1926.1101(k)(9)(viii)(J) - Asbestos.

LEGEND
DANGER

ASBESTOS

CANCER AND LUNG DISEASE HAZARD
RESPIRATORS AND PROTECTIVE CLOTHING ARE REQUIRED
IN THIS AREA

- h. Provide spacing between respective lines at least equal to the height of the respective upper line.
- i. Additional Signage: Shall also be posted in accordance with OSHA 29 CFR 1926.1101(k)(9)(viii)(J) - Asbestos

DANGER
ASBESTOS
CANCER AND LUNG DISEASE HAZARD

**AUTHORIZED PERSONNEL ONLY
RESPIRATORS AND PROTECTIVE CLOTHING
ARE REQUIRED IN THIS AREA
DANGER
ASBESTOS
CANCER AND LUNG HAZARD
KEEP OUT**

- j. Post an approximately 10 inch by 14 inch manufactured sign at each entrance to each work area displaying the following legend with letter sizes and styles of a visibility at least equal to the following:

<u>LEGEND</u>	<u>NOTATION</u>
No Food, Beverages or Tobacco Permitted	3/4 inch Block
All Persons Shall Don Protective Clothing (Coverings) Before Entering the Work Area	3/4 inch Block
All Persons Shall Shower Immediately After Leaving Work Area and Before Entering the Changing Area	3/4 inch Block

M. Decontamination Procedures

1. Contractor shall require all workers and visitors to adhere to the following personal decontamination procedures whenever they leave the work area:
 - a. Require that all workers use the following decontamination procedure as a minimum requirement whenever leaving the work area.
 - b. When exiting area, remove disposable coveralls, disposable head covers, and disposable footwear covers or boots in the Equipment Room.
 - c. Still wearing respirators, proceed to showers. Showering is mandatory. Care must be taken to follow reasonable procedures in removing the respirator to avoid asbestos fibers while showering. The following procedure is required as a minimum:
 - 1) Thoroughly wet body including hair and face. If using a PAPR, hold blower unit above head to keep canisters dry.
 - 2) With respirator still in place thoroughly wash body, hair, respirator face piece, and all parts of the respirator except the blower unit and battery pack on a PAPR. Pay particular attention to seal between face and respirator and under straps.
 - 3) Take a deep breath, hold it and/or exhale slowly, completely wet hair, face, and respirator. While still holding breath, remove respirator and hold it away from face before starting to breathe.
 - 4) Carefully wash face-piece of respirator inside and out.
 - d. If using PAPR, shut down in the following sequence, first cap inlets to filter cartridges, then turn off blower unit (this sequence will help keep debris which has collected on the inlet side of filter from dislodging and contaminating the outside of the unit). Thoroughly wash blower unit and hoses. Carefully wash battery pack with wet rag. Be extremely cautious of getting water in battery pack as this will short out and destroy battery.
 - 1) Shower completely with soap and water.
 - 2) Rinse thoroughly.
 - 3) Rinse shower room walls and floor prior to exit.
 - 4) Proceed from shower to changing room and change into street clothes or into new disposable work items.

- e. Require that all workers use the following decontamination procedure as a minimum requirement whenever leaving the work area with a half or full face cartridge type respirator:
 - 1) When exiting area, remove disposable coveralls, disposable headcovers, and disposable footwear covers or boots in the equipment room.
 - 2) Still wearing respirators, proceed to showers. Showering is mandatory. Care must be taken to follow reasonable procedures in removing the respirator and filters to avoid asbestos fibers while showering. The following procedure is required as a minimum:
 - 3) Thoroughly wet body from neck down.
 - 4) Wet hair as thoroughly as possible without wetting the respirator filter if using an air purifying type respirator.
 - 5) Take a deep breath, hold it and/or exhale slowly, complete wetting of hair, thoroughly wetting face, respirator and filter (air purifying respirator). While still holding breath, remove respirator and hold it away from face before starting to breath.
 - 6) Dispose of wet filters from air purifying respirator.
 - 7) Carefully wash facepiece of respirator inside and out.
 - 8) Shower completely with soap and water.
 - 9) Rinse thoroughly.
 - 10) Rinse shower room walls and floor prior to exit.
 - 11) Proceed from shower to changing room and change into street clothes or into new disposable work items.
- N. Project Decontamination
 1. If the asbestos abatement work is on damaged or friable materials, then the building space is deemed contaminated before start of the work and in need of decontamination. In this case, the procedure includes two cleanings of the primary barrier plastic prior to its removal and two cleanings of the room surfaces to remove any new or existing contamination.
 2. Work of this section includes the decontamination of air in the work area which has been, or may have been contaminated by the elevated airborne asbestos fiber levels generated during abatement activities, or which may previously have had elevated fiber levels due to friable materials in the space.
 3. Work of this section also includes the cleaning, decontamination, and removal of temporary facilities installed prior to abatement work and decontamination of all surfaces (ceiling, walls, floor) of the work area, and all furniture or equipment in the work area.
 4. First Cleaning
 - a. Carry out a first cleaning of all surfaces of the work area including items of remaining sheeting, tools, scaffolding and/or staging by use of damp-cleaning and mopping, and/or a HEPA filtered vacuum. (Note: A HEPA vacuum will fail if used with wet material). Do not perform dry dusting or dry sweeping. Use each surface of a cleaning cloth one time only and then dispose as contaminated waste. Continue this cleaning until there is no visible debris from removed materials on plastic sheeting or other surfaces. Upon authorization of the Owner's Representative proceed with encapsulation of substrate.
 - b. Perform encapsulation of substrate where required at this time. Maintain pressure differential system in operation during encapsulation work. Allow encapsulant to dry before proceeding with removal of Secondary layer of plastic.
 5. Second Cleaning
 - a. Upon authorization of the Owner's Representative, remove all Primary Barrier sheeting and Material Decontamination Unit, if there is one, leaving only the following:
 - 1) Critical Barrier which forms the sole barrier between the work area and other portions of the building or outside.
 - 2) Critical Barrier Sheeting over lighting fixtures and clocks, ventilation openings, doorways, convectors, speakers and other openings.

- 3) Personnel Decontamination Unit.
 - 4) Pressure Differential System in continuous operation.
 - b. Remove all filters in Air Handling System(s) and dispose of as asbestos-containing waste.
 6. Final Cleaning: Carry out a final cleaning of all surfaces in the work in the same manner as the first cleaning immediately after removal of primary plastic. This cleaning is now being applied to existing room surfaces. Take care to avoid water marks or other damage to surfaces.
 7. Visual Inspection: Perform a complete visual inspection with the Owner's Representative of the entire work area including decontamination unit, all plastic sheeting, seals over ventilation openings, doorways, windows, and other openings; look for debris from any sources, residue on surfaces, dust or other matter. If any such debris, residue, dust or other matter is found repeat cleaning and continue decontamination procedure from that point. When the area is visually clean, complete the certification at the end of this section.
 8. Final Air Sampling
 - a. After the work area is found to be visually clean, air samples will be taken and analyzed in accordance with the procedures set forth in Paragraph "Powered Air Purifying Respirator (PAPR).
 - b. If Release Criteria are not met, repeat cleaning and continue decontamination procedure from that point.
 - c. If Release Criteria is met, remove the interior of the decontamination unit leaving in place only the Critical Barriers separating the work area from the rest of the building and the operating negative pressure system.
 - d. Any small quantities of residual material found upon removal of the plastic sheeting shall be removed with a HEPA filtered vacuum cleaner and local area protection. If significant quantities, as determined by the Owner's Representative, are found then the entire area affected shall be decontaminated as specified herein for the cleaning.
- O. Work Area Clearance
1. Air Monitoring
 - a. Visual Inspection is required as a prerequisite of air testing.
 - b. To determine if the elevated airborne asbestos structure concentration during abatement operations have been reduced to the specified level, the Owner's Representative will secure samples and analyze them according to the following procedures.
 2. Aggressive Sampling
 - a. All air samples will be taken using aggressive sampling techniques as follows. (There are no standards available for flow rate of leaf blowers or large fans. However, this information is not critical to the success of the procedure).
 - b. Before sampling pumps are started, the exhaust from forced-air equipment (leaf blower with at least 1 horsepower electric motor) will be swept against all walls, ceilings, floors, ledges and other surfaces in the room. This procedure will be continued for five minutes per 10,000 cubic feet of room volume.
 - c. Air samples will be collected in areas subject to normal air circulation away from room corners, obstructed locations, and sites near windows, doors or vents.
 3. Schedule of Air Samples
 - a. General: The number and volume of air samples taken and analytical methods used by the Owner's Representative will be in accordance with the following schedule. Sample volumes given may vary depending upon the analytical instruments used. In each homogeneous work area after completion of all cleaning work, samples will be taken and analyzed by either PCM or TEM analysis.
 - b. Transmission Electron Microscopy (TEM) Samples:
 - 1) In each homogeneous work area after completion of all cleaning work, samples will be taken and analyzed by either PCM or TEM analysis as follows:
 - 2) Samples will be collected on 25 mm cassettes with filter media: TEM - 0.45 micrometer mixed cellulose ester or 0.40 micrometer polycarbonate, with 5.0 micron mixed cellulose ester backing filter.

Location Sampled	Number of Samples	Detection Limit (f/cc)	Minimum Volume (Liters)	Rate LPM
Each Work Area	5	0.005	1,300	2-10

- 3) TEM Analysis will be performed using the analysis method set forth in the AHERA Regulation 40 CFR Part 763 Appendix A.
 - 4) Asbestos Structures referred to in this Section include asbestos fibers, bundles, clusters, or matrices, as defined by method of analysis.
 - 5) Decontamination of the work site is complete when all the sample results are below 0.01 fibers per cubic centimeters (f/cc) of air or 70 structures per square millimeter.
- c. Phase Contrast Microscopy (PCM) Samples:
- 1) In each homogeneous work area after completion of all cleaning work, samples may be taken and analyzed as follows:
 - 2) Samples will be analyzed by PCM for clearance in areas where ceiling tile and/or pipe insulation are removed
 - 3) Samples will be collected on 25 mm cassettes with filter media: PCM - 0.8 micrometer mixed cellulose ester.

Location Sampled	Number of Samples	Detection Limit (s/cc)	Minimum Volume (Liters)	Rate LPM
Each Work Area	1-5	0.01	2,400	2-10

- 4) PCM Analysis: Fibers on each filter will be measured using the NIOSH 7400 Method entitled "Fibers" published in the NIOSH Manual of Analytical Methods, 3rd Edition, Second Supplement, August 1987.
 - 5) Fibers: Referred to in this section include fibers regardless of composition as counted by the phase contrast microscopy method used
 - 6) Decontamination of the work site is complete when all the sample results are below 0.01 fibers per cubic centimeters (f/cc) of air or 70 structures per square millimeter.
4. Failure of Clearance Sampling: Should results from analysis of final clearance air samples not meet the specified criteria, Contractor will be responsible for the payment of all costs, including Consultant's time for subsequent clearance air sampling. The costs associated with subsequent re-sampling for final clearance shall be deducted from the Contractor's final payment of the contract amount.

P. Removal Of Pipe Insulation

1. The work of this section applied to the removal of asbestos-containing Pipe Insulation.
 - a. Place one layer of 6-mil fire retardant polyethylene sheeting directly below the work. The sheet shall be of sufficient size to completely wrap the pipe once it has been removed.
 - b. Thoroughly wet the ends of the pipe with amended water and scrape off a minimum of 6 inches of asbestos wrap from both ends of the pipe. Immediately place the wetted material into pre-labeled asbestos disposal bag(s).
 - c. Detach the pipe at each scraped end and place the pipe onto one sheet of 6-mil fire retardant polyethylene sheeting. Wrap the pipe with the 6-mil fire retardant polyethylene sheeting. Contractor shall wrap the pipe with a second sheet of 6-mil, fire retardant polyethylene sheeting and label as asbestos-containing material. Dispose of the bag(s) and duct in accordance with the Paragraph "Handling and Disposal of Asbestos Contaminated Waste" of this specification.
 - d. Upon clearance from the Owner's Representative, Contractor shall remove the 6-trail, fire retardant polyethylene sheeting from the openings.

Q. Glove Bag Removal

1. The work of this section applies to full containment or glovebag removal.
2. Isolate the area in accordance with Paragraph "Temporary Facilities."
3. Construct a decontamination unit as described in Paragraph "Decontamination Units" and attach to the work area.
4. Set up pressure differential isolation and ventilation of the work area in accordance to Paragraph "Pressure Differential System."
 - a. Upon approval of the enclosure by the Owner's Representative, Contractor may proceed to remove the material using the following method.
 - b. Thoroughly wet to satisfaction of the Owner's Representative, asbestos-containing insulation to be removed prior to stripping and/or tooling to reduce fiber dispersal into the air. Accomplish wetting by a fine spray (mist) of amended water or removal encapsulant. Saturate material sufficiently to wet the substrate without causing excess dripping. Allow time for removal encapsulant to penetrate material thoroughly. If amended water is used, spray material repeatedly during the work process to maintain a continuously wet condition. If a removal encapsulant is used, apply in strict accordance with manufacturer's written instructions. If insulation is covered with canvas, Contractor will wet the exterior covering and slice it with utility knife while saturating the material.
 - c. Mist work area continuously with amended water whenever necessary to reduce airborne fiber levels using commercially available "foggers."
 - d. Remove saturated asbestos-containing material in small sections from all areas. Do not allow material to dry out. As it is removed, simultaneously pack material while still wet into disposal bags. Twist neck of bags, bend over and seal with minimum three wraps of duct tape. Clean outside and move to wash down station adjacent to material decontamination unit.
 - e. Evacuate air from disposal bags with a HEPA filtered vacuum cleaner before sealing.
 - f. Contractor must always clean area of visible asbestos debris prior to end of shift.
5. These procedures shall be followed to remove pipe insulation elbows:
 - a. Install critical barriers to isolate the work site. Install 2 or 3 Stage Decontamination Units.
 - b. HEPA vacuum the work site.
 - c. Provide negative air machine in addition to those required, in the vicinity of the work. Arrange so that exhaust is into the work area, oriented in a direction away from the work. Extend a 2-inch diameter flexible non-collapsing duct from the intake end to a point no more than 4'-0" from any scraping or brushing activity.
 - d. Locate intake of duct so that airflow is horizontally and slightly downward into intake. Replace primary filter on negative air machine at an interval of no greater than 30 minutes. Allow no more than one scraping or brushing activity per negative air machine.
 - e. Check pipe where the work will be performed. Wrap damaged (broken lagging, hanging, etc.), pipe in 6 mil plastic and "candy-stripe" with duct tape. Place one layer of duct tape around undamaged pipe at each end where the glovebag will be attached.
 - f. Place necessary tools into pouch located inside glovebag. This will usually include: bone saw, utility knife, rags, scrub brush, wire cutters, tin snips and pre-wetted cloth.
 - g. Place one strip of plastic adhesion tape along the edge of the open top slit of glove bag for reinforcement.
 - h. Place the glove bag around section of pipe to be worked on and staple top together through reinforcing tape. Next, tape the ends of glovebag to pipe itself, where previously covered with plastic or tape.
 - i. Use smoke tube and aspirator bulb to test seal. Place tube into water sleeve (two-inch opening to glovebag) squeezing bulb and filling bag with visible smoke. Remove smoke tube and twist water sleeve closed. While holding the water sleeve tightly, gently squeeze glovebag and by using a flashlight, look for smoke leaking out, (especially at the top and ends of the glovebag). If leaks are found, tape closed using plastic adhesion tape and re-test.
 - j. Insert wand from garden sprayer through water sleeve. Plastic adhesion tape water sleeve tightly around the wand to prevent leakage.

- k. One person places its hands into the long-sleeved gloves while the second person directs garden sprayer at the work.
 - l. Use bone saw, if required, to cut insulation at each end of the section to be removed. A bone saw is a serrated heavy gauge wire with ring-type handles at each end. Throughout this process, spray amended water or removal encapsulant on the cutting area to keep dust to a minimum.
 - m. Remove insulation using putty knives or other tools. Place pieces in bottom of bag without dropping.
 - n. Rinse all tools with water inside the bag and place back into pouch.
 - o. Using scrub brush, rags and water, scrub and wipe down the exposed pipe. (Inexpensive horse rub-down mittens work well for this).
 - p. Remove water wand from water sleeve and attach the small nozzle from HEPA-filtered vacuum. Turn on the vacuum only briefly to collapse the bag.
 - q. Remove the vacuum nozzle, twist water sleeve closed and seal with plastic adhesion tape.
- R. Handling And Disposal Of Asbestos-Containing Waste
- 1. All waste and asbestos contaminated waste shall be double bagged in pre-labeled 6-mil airtight puncture resistant bags. Labeling shall be in accordance with OSHA and EPA requirements.
 - a. Bags of asbestos-containing waste shall be sealed with tape in the work area. Asbestos waste shall not be allowed to dry out prior to sealing bags. While in the work area, bags shall be decontaminated of any bulk debris by wet wiping. Bags shall be pre-labeled in accordance with OSHA and EPA.
 - b. The Contractor shall ensure that the sealed bags are transported to the waste disposal site.
 - 2. The Contractor shall establish a manifest system to enable the Owner to report the quantity of asbestos waste being deposited at the landfill. Contractor shall report the quantity of waste in pounds or tons as appropriate. The Contractor must be able to demonstrate custody over all asbestos waste from the time it is removed from the work area until it is deposited at the land fill.
 - a. Copies of the manifest and any receipts generated during the handling and disposal process shall be provided to the Owner's Representative and the Owner.
 - b. Final manifest and documents must be provided to the Owner's Representative and the Owner within two weeks of the removal of the asbestos materials from the site by the waste hauler.
- S. Encapsulation Of Asbestos-Containing Materials
- 1. General provisions of Contract, including General and Supplementary Conditions and Division 1, apply to work of this section.
 - a. The work includes the sealing of all piping or vessels from which asbestos-containing insulation has been removed with one coat of a lock down encapsulant.
 - b. Where repair work is being performed, the end will be sealed with a minimum of one coat of bridging encapsulant.
 - 2. Submittals
 - a. Product Data: Submit manufacturer's technical information including label analysis and application instructions for each material proposed for use.
 - b. Installation Instructions: Submit manufacturer's installation instructions with specific project requirements noted.
 - c. Performance Warrantee: Submit manufacturer's performance guarantee.
 - d. Certification: Submit written approval of entity installing the encapsulant from encapsulant manufacturer.
 - e. Safety Data Sheet: Submit the Safety Data Sheet, or equivalent, in accordance with the OSHA Hazard Communication Standard (29 CFR 1910.1200) for each surfactant and encapsulating material proposed for use on the work. Include a separate attachment for each sheet indicating the specific worker protective equipment proposed for use with the material indicated.

3. Deliver materials to the job site in original, new and unopened packages and containers bearing manufacturer's name and label, and following information:
 - a. Name or title of material
 - b. Manufacturer's stock number and date of manufacture
 - c. Manufacturer's name
 - d. Thinning Instructions
 - e. Application Instructions
4. Deliver materials together with a copy of the OSHA Safety Data Sheet for the material.
5. Job Conditions
 - a. Apply encapsulating materials only when environmental conditions in the work area are as required by the manufacturer's instructions.
6. Quality Assurance
 - a. Installation of Spray-on Encapsulation Materials: Install spray-on materials by a firm and personnel approved by the manufacturer of the primary materials.
 - b. Testing: Test material to be encapsulated using methods set forth in ASTM E1494 "Standard Practice for Encapsulants Spray-or-Trowel-Applied for Friable Asbestos-Containing Building Materials."
 - c. Performance Warranty: Submit written Performance Warranty, executed by the manufacturer and co-signed by the Contractor, agreeing to repair/replace spray-on work which has cracked, fallen from substrate, or otherwise deteriorated to a condition where it would not perform effectively for its intended purposes due substantially to defective materials or workmanship and not due to abuse by occupants, improper maintenance, non-foreseeable ambient exposures or other causes beyond anticipated conditions and manufacturer's/contractor's control.
 - d. Compatibility: Selection and use of encapsulant shall be compatible with replacement materials. Submit manufacturer's data indicating compatibility with replacement materials.
7. Product Selection
 - a. Encapsulants: Provide penetrating or bridging type encapsulants specifically designed for application to asbestos-containing material.
 - b. Standards: Product shall be rated as acceptable for use intended when field tested in accordance with ASTM E1494 "Standard Practice for Encapsulants Spray-or-Trowel-Applied for Friable Asbestos-Containing Building Materials."
 - c. Fire Safety: Use only materials that have a flame spread index of less than 25, when dry, when tested in accordance with ASTM E84.
8. Manufacturers
 - a. Available Manufacturers: Subject to compliance with requirements, manufacturers offering products, which may be incorporated in the work, include, but are not limited to the following:
 - 1) Penetrating Encapsulants: As currently accepted by the EPA. Refer to most recent EPA approval list.
 - 2) Bridging Encapsulants: As currently accepted by the EPA. Refer to most recent EPA approval list.
9. General
 - a. Prior to applying any encapsulating material, ensure that application of the sealer will not cause the base material to fail and allow the sealed material to fall of its own weight or separate from the substrate. Should Contractor doubt the ability of the installation to support the sealant, request direction from the Owner's Representative before proceeding with the encapsulating work.
 - b. Do Not Commence Application of encapsulating materials until all removal work within the work area has been completed.
10. Worker Protection
 - a. Before beginning work with any material for which a Safety Data Sheet has been submitted, provide workers with the required protective equipment. Require that appropriate protective equipment be used at all times.

- b. In addition to protective breathing equipment required by OSHA requirements or by this specification, use painting pre-filters on respirators to protect the dust filters when organic solvent based encapsulants are used.
11. Substrate
- a. Apply lock down encapsulant to all substrate after all asbestos-containing materials have been removed. Apply in strict accordance with the manufacturer's printed instructions for use of the encapsulation as an asbestos coating. Any deviations from such printed instructions shall be approved by the Owner's Representative in writing prior to commencing work.
 - b. Apply encapsulant with an airless spray gun with air pressure and nozzle orifice as recommended by the encapsulant manufacturer.
- T. Removal Of Floor Tile
1. This section applies to the removal of floor tile.
- a. Prior to start of work, wet wipe all surfaces including floor tile to remove any visible dust.
 - b. Isolate the room by sealing hallway or doors and installing critical barriers on all ducting, windows and other penetrations of the room, in the specified area. Install a splash guard a minimum of 4 feet high on the walls of the room with one layer of 6-mil fire retardant poly.
 - c. Install a two-stage decontamination configuration contiguous (under certain conditions may be remote) with the work in accordance with Paragraph "Decontamination Units."
 - d. Using water or amended water in a Hudson-type sprayer or garden sprayer, lightly mist the area where the material is to be removed. This may take several passes with the hose of the sprayer. Allow time for the water to soak into the material.
 - e. Immediately place individual tiles in proper asbestos disposal bags. Vacuum collapse the bag, twist the neck of the bag, tape with duct tape, fold the twisted portion over onto itself and tape again. Wipe the outside of the bag with clean damp cloths and place the bag into a second prelabeled disposal bag. Tape shut the second bag.
- U. Removal Of Fireproofing
1. The work of this section applies to the removal of all asbestos containing fireproofing including all over-spray that may be located on concrete block, columns, metal deck, beams, fixtures conduit and ducting.
- a. Isolate the floor per Paragraph "Temporary Enclosure."
 - b. Construct a decontamination unit as described in Paragraph "Decontamination Units" and attach to the work area.
 - c. Set up pressure differential isolation and ventilation of the work area in accordance to Paragraph "Temporary Pressure Differential and Air Circulation System."
 - d. Upon approval of the enclosure by the Owner's Representative, contractor may proceed to remove the material using the following method.
 - e. Pre-clean columns, beams, electrical, mechanical and plumbing systems in the work area using wet wipe and HEPA vacuuming methods. Mask off with flame retardant polyethylene sheeting to protect from contamination during bulk abatement.
 - f. Thoroughly wet to satisfaction of the Owner's Representative, asbestos-containing fireproofing to be removed prior to stripping and/or tooling to reduce fiber dispersal into the air. Accomplish wetting by a fine spray (mist) of amended water or removal encapsulant. Saturate material sufficiently to wet the substrate without causing excess dripping. Allow time for removal encapsulant to penetrate material thoroughly. If amended water is used, spray material repeatedly during the work process to maintain a continuously wet condition. If a removal encapsulant is used, apply in strict accordance with manufacturer's written instructions.
 - g. Mist work area continuously with amended water whenever necessary to reduce airborne fiber levels using commercially available "foggers."
 - h. Remove saturated asbestos-containing material in small sections from all areas. Do not allow material to dry out. As it is removed, simultaneously pack material while still wet into

disposal bags. Twist neck of bags, bend over and seal with minimum three wraps of duct tape. Clean outside and move to wash down station adjacent to material decontamination unit.

- i. Evacuate air from disposal bags with a HEPA filtered vacuum cleaner before sealing.
- j. Provide Pressure Differential Machine in addition to those required in Paragraph "Pressure Differential System," in the vicinity of the work. Arrange so that exhaust is into the work area, oriented in a direction away from the work. Extend a 12" diameter flexible non-collapsing duct from the intake end to a point no more than 4'-0" from any scraping or brushing activity.
- k. Locate intake of duct so that air flow is horizontally and slightly down-ward into intake. Replace primary filter on pressure differential machine at an interval of no greater that 30 minutes. Allow no more than one scraping or brushing activity per pressure differential machine.

V. Removal Of Wall Plaster: HEPA vacuum work site.

- 1. Place two layers of 6-mil flame retardant polyethylene sheeting on the floor adjacent to the wall to be demolished. Pull the wall down in manageable sections onto the polyethylene sheeting. Control dust and fiber release by misting the air and lightly wetting the material with amended water from a Hudson-type sprayer or garden sprayer as it is demolished.
- 2. Wrap the first layer of polyethylene sheeting around the material and seal with duct tape. Wrap the second layer of polyethylene sheeting around the bundle and seal with duct tape.
- 3. Label and dispose of the entire bundle.
- 4. Provide Pressure Differential Machine in addition to those required in Paragraph "Pressure Differential System," in the vicinity of the work. Arrange so that exhaust is unto the work area, oriented in a direction away from the work. Extend a 12-inch diameter flexible non-collapsing duct from the intake end to a point no more than 4'-0" from any scraping or brushing activity.
- 5. Locate intake of duct so that air flow is horizontally and slightly down-ward into intake. Replace primary filter on negative air machine at an interval of no greater that 30 minutes.

W. Clean-Up Of Asbestos-Containing Debris On Ceiling Tile Or Solid Ceiling

- 1. This section applies to the decontamination of the entire plaster ceiling, removal of existing fiberglass on duct work and removal of all batt insulation covering the existing plaster ceiling.
 - a. Isolate the floor per Paragraph "Temporary Facilities."
 - b. Construct a decontamination unit as described in Paragraph "Decontamination Units" and attach to the work area. General Contractor will give direction regarding exact location of decontamination unit(s).
 - c. Set up pressure differential isolation and ventilation of the work area in accordance to Paragraph "Temporary Pressure Differential and Air Circulation System."
 - d. Upon approval of the enclosure by the Owner's Representative, contractor may proceed to remove the material using the following method:
- 2. These procedures shall be followed to for clean up of asbestos-containing debris on existing plaster ceiling:
 - a. This work will be performed prior to the removal of fireproofing. The isolation of the work area is considered essential to the pre-cleaning activities for the total area. Isolate the area in accordance with Paragraph "Temporary Facilities."
 - b. Remove asbestos-containing debris and fiberglass batt and duct insulation and decontaminate the area using the following procedures:
 - 1) Remove all small debris with the HEPA vacuum.
 - 2) Gently mist all fiberglass insulation, remove from ducts and ceiling and place into pre-labeled hazardous disposal bags and dispose of in accordance with Paragraph "Disposal of Asbestos Containing Waste Material."
 - 3) Exposure of ducting will expose all fireproofing overspray, this material may be removed during the removal of fireproofing from decks and beams.

- 4) Pick up all large visible debris on the ceiling or any horizontal surfaces and place in the bottom of a 6-mil polyethylene disposal bag conforming to the requirements of Paragraph "Disposal of Asbestos-Containing Waste." Place pieces in the bag without dropping and avoiding unnecessary disturbance and release of material.
 - 5) HEPA vacuum the entire plaster ceiling surface.
 - c. Upon completion of the decontamination of the area request a visual inspection of the ceiling and other horizontal surfaces. This area will be considered a portion of work area for the duration of the work and will be included in the final encapsulation of the area.
- X. Removal Of Adhesive: This section applies to the removal of all asbestos-containing floor tile and adhesive, sheet vinyl flooring, vinyl floor tile, and baseboard adhesive, etc.
1. Ensure that workers are equipped with proper respiratory protection. In addition to the HEPA cartridges, respirators must also be equipped with organic solvent cartridges.
 2. Provide HEPA filtered fan units in the vicinity of the work. Arrange so that units exhaust outside the building. Replace primary filters on HEPA filtered fan units at an interval of no greater than 30 minutes.
 3. Apply adhesive removal solvent as recommended by manufacturer after removal of floor tile has been completed.
 4. Provide tile adhesive (mastic) remover that meets the following criteria:
 - a. Flash Point: 122E or greater.
 - b. Special Precautions: No heavy smoke generated if ignited.
 - c. Health Effects: Limited to mild skin rash or eye irritation.
 - d. Respiratory Protection: MSHA - NIOSH approved Organic vapor cartridges in conjunction with standard HEPA filters.
 - e. Petroleum Distillates: None.
 - f. Odor: Pine, Citrus or none.

Use of diesel fuel in the removal of tile and baseboard adhesive is strictly prohibited.

5. Remove adhesive in small sections from all areas. Do not allow material to dry out. As adhesive is removed, simultaneously pack rags contaminated with adhesive material into disposal bags. Twist neck of bags, bend over and seal with minimum three wraps of duct tape. Clean outside of bag and move to material decontamination unit.
6. Upon completion of adhesive removal, thoroughly clean bare substrate of all solvent residue.
7. Place adhesive residue in proper asbestos disposal bags. Vacuum collapse the bag, twist the neck of the bag, tape with duct tape, fold the twisted portion over onto itself and tape again. Wipe the outside of the bag with clean damp cloths and place bag into second pre-labeled disposal bag. Tape shut the second bag.

CERTIFICATE OF WORKER'S ACKNOWLEDGEMENT

PROJECT NAME: _____

PROJECT ADDRESS: _____

CONTRACTOR: _____

WORKING WITH ASBESTOS CAN BE DANGEROUS. INHALING ASBESTOS FIBERS HAS BEEN LINKED WITH VARIOUS TYPES OF CANCER IF YOU SMOKE AND INHALE ASBESTOS FIBERS, THE CHANCE THAT YOU WILL DEVELOP LUNG CANCER IS GREATER THAN THAT OF THE NON-SMOKING PUBLIC.

Your employer's contract with the Owner for the above project requires that: You be supplied with the proper respirator and be trained in its use. You be trained in safe work practices and in the use of the equipment found on the job. You receive a medical examination. These things are to have been done at no cost to you. By signing this certification you are assuring the Owner that your employer has met these obligations to you.

RESPIRATORY PROTECTION: I have been trained in the proper use of respirators, and informed of the type respirator to be used on the above referenced project. I have a copy of the written respiratory protection manual issued by my employers. I have been equipped at no cost with the respirator to be used on the above project.

TRAINING COURSE: I have been trained in the dangers inherent in handling asbestos and breathing asbestos dust and in proper work procedures and personal and area protective measures. The topics covered in the course included the following:

- Physical characteristics of asbestos
- Health hazards associated with asbestos
- Respiratory protection
- Use of protective equipment
- Pressure differential systems
- Work practices including hands-on or on-the-job training
- Personal decontamination procedures
- Air monitoring, personal and area

MEDICAL EXAMINATION: I have had a medical examination within the last 12 months which was paid for by my employer. This examination included: health history, pulmonary function tests and may have included an evaluation of a chest x-ray.

RESPIRATORY PROTECTION PROGRAM

Project Name _____

Location _____

Date _____

Based upon airborne asbestos-fiber counts encountered on previous projects of similar type working on materials similar to those found on the above referenced project. The following level of respiratory protection is proposed for the indicated operations to maintain an Airborne Fiber Count (as measured by the NIOSH 7400 Method) below the specified Permissible Exposure Limit (PEL) inside the respirator face piece.

Table with 5 columns: Operation, Anticipated f/cc, Respiratory Protection, Protection Factor, f/cc in Mask. Rows include: Installing sheet plastic, Removing trim in contact with asbestos-containing material, Removal of architectural finish or fireproofing, Removal of pipe insulation, Removal of fitting insulation, Encapsulation of pipe and boiler insulation, Gross debris removal, Cleaning "primary" sheet plastic, Cleaning "critical" barrier, Removing Decontamination Unit, Other.

The Contractor certifies that to the best of its knowledge and belief the above represent a true and accurate representation of Airborne Fiber Counts to be expected for the operations indicated, and are based upon airborne fiber data from past projects with similar materials and operations.

END OF SECTION 02 82 33 00

SECTION 02 82 33 00a - REMOVAL OF NONFRIABLE ASBESTOS-CONTAINING MATERIALS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for removal of nonfriable asbestos-containing materials. Products shall be as follows or as directed by the the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Definitions

1. ACM: Asbestos Containing material which is any material containing more than one percent asbestos.
2. Amended Water: Water containing a wetting agent or surfactant with a maximum surface tension of 2.9 Pa 29 dynes per centimeter when tested in accordance with ASTM D 1331.
3. Area Sampling: Sampling of asbestos fiber concentrations which approximates the concentrations of asbestos in the theoretical breathing zone but is not actually collected in the breathing zone of an employee.
4. Asbestos: The term asbestos collectively refers to a naturally occurring mineral known by the following specific names: chrysotile, amosite, crocidolite, tremolite, anthophyllite, and actinolite.
5. Asbestos control Area: That area where asbestos removal operations are performed. The area shall be isolated by physical boundaries to assist in the prevention of the uncontrolled access by non-qualified persons.
6. Asbestos Fibers: Those fibers having an aspect ratio of at least 3:1 and longer than-5 micrometers as determined by National Institute for Occupational Safety and Health (NIOSH) Method 7400.
7. Asbestos Permissible Exposure Limit: 0.1 fibers per cubic centimeter of air as an e-hour time weighted average measured in the breathing zone as by defined 29 CFR 1926.1101 or other Federal legislation having legal jurisdiction for the protection of workers health.
8. Background: The ambient airborne asbestos concentration in an uncontaminated area as measured prior to any asbestos hazard abatement efforts. Background concentrations for contaminated areas are measured in similar but asbestos free locations.
9. Contractor: The Contractor is that individual, or entity under contract to the Owner to perform the herein listed work.
10. Contractor/Supervisor (Asbestos abatement): A person who has successfully completed training and is therefore accredited as a Contractor/Supervisor under a State Model Accreditation Plan or EPA Model Accreditation Plan as described in 40 CFR 763.
11. Critical Barrier: The layer of polyethylene sheeting that covers an opening or penetration in a room or area that is to become a negative pressure enclosure.
12. Encapsulation: The abatement of an asbestos hazard through the appropriate use of chemical encapsulants.
13. Encapsulants: Specific materials in various forms used to chemically or physically entrap asbestos fibers in various configurations to prevent these fibers from becoming airborne. There are four types of encapsulants as follows which must comply with performance requirements as specified herein.
 - a. Removal Encapsulant (can be used as a wetting agent)
 - b. Bridging Encapsulant (used to provide a tough, durable surface coating to asbestos containing material)
 - c. Penetrating Encapsulant (used to penetrate the asbestos containing material encapsulating all asbestos fibers and preventing fiber release due to routine mechanical damage)
 - d. Lock-Down Encapsulant (used to seal off or "lock-down" minute asbestos fibers left on surfaces from which asbestos containing material has been removed).

14. Friable Asbestos Material: Any material containing more than one percent asbestos that can be crumbled, pulverized, or reduced to powder by hand pressure when dry.
15. Glovebag Technique: Those asbestos removal and control techniques put forth in 29 CFR 1926.1101.
16. HEPA Filter Equipment: High efficiency particulate air (HEPA) filtered vacuum and/or exhaust ventilation equipment with a filter system capable of collecting and retaining asbestos fibers. Filters shall retain 99.97 percent of particles 0.3 microns or larger as indicated in UL 586.
17. the Owner: That qualified person employed directly by the Owner to monitor, sample, inspect the work, and advise the Owner.
18. Negative Pressure Enclosure (NPE): That engineering control technique described as a negative pressure enclosure in 29 CFR 1926.1101.
19. Non-friable Asbestos Material: Material that contains asbestos in which the fibers have been immobilized by a bonding agent, coating, binder, or other material so that the asbestos is well bound and will not normally release asbestos fibers during any appropriate use, handling, storage or transportation. It is understood that asbestos fibers may be released under other conditions such as demolition, renovation, removal, or mishap.
20. Personal Sampling: Air sampling which is performed to determine asbestos fiber concentrations within the breathing zone of a specific employee, as performed in accordance with 29 CFR 1926.1101.
21. Competent Person (CP): A person who has successfully completed training and is therefore accredited under a legitimate State Model Accreditation Plan or EPA Model Accreditation Plan as described in 40 CFR 763 as a Contractor/Supervisor and shall be appropriately licensed according to the Statutes of the State in which the work is to be performed.
22. TEM: Refers to Transmission Electron Microscopy.
23. Time Weighted Average (TWA): The TWA is an 8-hour time weighted average airborne concentration of asbestos fibers.
24. Wetting Agent: A chemical added to water to reduce the water's surface tension thereby increasing the water's ability to soak into the material to which it is applied. An equivalent wetting agent must have a surface tension of at most 2.9 Pa 29 dynes per centimeter when tested in accordance with ASTM D 1331.

C. Requirements

1. Description of Work: The work covered by this section includes the handling and control of asbestos containing materials and describes some of the resultant procedures and equipment required to protect workers, the environment and occupants of the building or area, or both, from contact with airborne asbestos fibers. The work also includes the disposal of any asbestos containing materials generated by the work. More specific operational procedures shall be outlined in the Asbestos Hazard Abatement Plan called for elsewhere in this specification. The asbestos work includes the use of non-friable removal technique(s) which is governed by 40 CFR 763 as indicated. Provide non-friable removal technique(s) as outlined in this specification for the locations indicated.
2. Medical Requirements: Provide medical requirements including but not limited to medical surveillance and medical record keeping as listed in 29 CFR 1926.1101.
 - a. Medical Examinations: Before exposure to airborne asbestos fibers, provide workers with a comprehensive medical examination as required by 29 CFR 1926.1101 or other pertinent State or local directives. This requirement must have been satisfied within the 12 months prior to the start of work on this contract. The same medical examination shall be given on an annual basis to employees engaged in an occupation involving asbestos and within 30 calendar days before or after the termination of employment in such occupation. Specifically identify x-ray films of asbestos workers to the consulting radiologist and mark medical record jackets with the word "ASBESTOS."
 - b. Medical Records: Maintain complete and accurate records of employees' medical examinations, medical records, and exposure data for a period of 30 years after termination of employment and make records of the required medical examinations and

- exposure data available for inspection and copying to: The Assistant Secretary of Labor for Occupational Safety and Health (OSHA), or authorized representatives of them, and an employee's physician upon the request of the employee or former employee.
- c. Medical Certification: Submit written certification for each worker and contractor/supervisor, signed by a licensed physician indicating that the worker and contractor/supervisor has met or exceeded all of the medical prerequisites listed herein and in 29 CFR 1926.1101 and 29 CFR 1910.134 as prescribed by law.
3. Training: Train all personnel involved in the asbestos control work in accordance with United States Environmental Protection Agency (USEPA) Asbestos Hazard Emergency Response Act (AHERA) training criteria or State training criteria whichever is more stringent. The Contractor shall document the training by providing a copy of a current training certification to the the Owner for each person assigned to work on this project. Furnish each employee with respirator training and fit testing documentation as required by 29 CFR 1910.134. Provide instruction on the engineering and other hazard control techniques and procedures to be used on this project.
 - a. Employee Training: Submit copies of training certificates for each employee indicating that the employee has received training at the appropriate level in accordance with 40 CFR 763.
 4. Permits, Licenses, and Notifications: Notify the local air pollution control district/agency and the the Owner in writing 10 working days prior to commencement of work in accordance with 40 CFR 61-SUBPART M or applicable state and local regulations. Obtain necessary permits or licenses in conjunction with asbestos removal, encapsulation, hauling, and disposal. Post the permit and/or license at the work site, visible from a non-controlled area. Notify the local fire department 3 days prior to removing fire-proofing material from the building including notice that the material contains asbestos.
 5. Environment, Safety and Health Compliance: Comply with the applicable requirements of the current issue of 29 CFR 1926.1101, 40 CFR 61-SUBPART A, and 40 CFR 61-SUBPART M or applicable State or local regulations regarding handling, storing, transporting, and disposing of asbestos waste materials. Submit matters of interpretation of standards to the appropriate administrative agency for resolution before starting the work. Where the requirements of this specification, applicable regulations, or referenced documents vary, the most stringent requirement shall apply.
 - a. Site Inspection: While performing asbestos engineering control work, the Contractor shall be subject to on-site inspection by the Federal, State, or local regulatory agencies and the Contracting Officer or its designated representative. If the work is found to be in violation of Federal, State, or local regulations or this specification, the Contracting Officer or its representative will issue a stop work order to be in effect immediately and until the violation is resolved. All related costs including standby time required to resolve the. violation shall be at the Contractor's expense.
 6. Respiratory Protection Program: Establish and implement a respirator program as required by ANSI 288.2 and 29 CFR 1910.134. Submit a written program manual or operating procedure including methods of compliance with regulatory statutes.
 - a. Respirator Program Records: Submit records of the respirator program as required by ANSI 288.2 and 29 CFR 1910.134.
 7. Contractor/Supervisor (Asbestos Abatement): The Contractor shall be represented on-site by a trained contractor/Supervisor. This person shall be on-site at all times when asbestos work is in progress. The Qualified Person, as defined herein, can be the Contractor/Supervisor.
 8. Hazard Communication: Adhere to all parts of 29 CFR 1910.1200 and 29 CFR 1926.59. Provide the Contracting Officer with a copy of the Safety Data Sheets (SDS) for all materials brought to the site. Review the Asbestos Survey Report(s) provided by the the Owner, if any.
 9. Asbestos Hazard Abatement Plan: Submit a detailed plan of the safety precautions such as lockout, tag-out, tryout, fall protection, and confined space entry procedures and equipment and work procedures to be used in the removal of materials containing asbestos. The plan shall be prepared by the Contractor (and reviewed and signed by an asbestos consultant (LAC) licensed according to the Statutes of the State in which the work is to be performed) for review and

recommendation for approval by the the Owner. The plan shall be forwarded to the the Owner for final approval at least 10 days prior to beginning abatement activities. The plan shall include but not be limited to the detailed description of personal protective equipment and work practices to be used including, but not limited to, respiratory protection, type of whole-body protection , the location of asbestos control areas including clean and dirty areas, buffer zones, showers, storage areas, change rooms, removal method, interface of trades involved in the construction, sequencing of asbestos related work, disposal plan, type of wetting agent and asbestos encapsulant to be used, locations of local exhaust equipment, planned air sampling strategies, and a detailed description of the method to be employed in order to control environmental pollution. The plan shall also include both fire and medical emergency response plans. The Asbestos Hazard Abatement Plan must be approved in writing prior to starting any asbestos work.

10. Testing Laboratory: Submit the name, address, and telephone number of each testing laboratory selected for the sampling, analysis, and reporting of airborne concentrations of asbestos fibers along with evidence that each laboratory selected holds the appropriate State license and/or permits and certification that each laboratory is American Industrial Hygiene Association (AIHA) accredited and that persons counting the samples have been judged proficient by current inclusion on the AIHA Asbestos Analysis Registry (AAR) and successful participation of the laboratory in the Proficiency Analytical Testing (PAT) Program. Where analysis to determine asbestos content in bulk materials or transmission electron microscopy is required, submit evidence that the laboratory is accredited by the National Institute of Science and Technology (NIST) under National Voluntary Laboratory Accreditation Program (NVLAP) for asbestos analysis.
11. Landfill Approval: Submit written evidence that the landfill for disposal is approved for asbestos disposal by the USEPA and State and local regulatory agency(s).
12. Waste Shipment Records/Asbestos Waste Manifest: Submit waste shipment records and/or asbestos manifest records, prepared in accordance with applicable Federal, State, or local regulations, signed and dated by an agent of the landfill, certifying the amount of asbestos materials delivered to the landfill, within 3 days after delivery.
13. Negative Exposure Assessment: Submit objective data demonstrating that the method(s) used for the specified non-friable ACM removal does not release airborne concentrations of asbestos fibers exceeding the TWA PEL or excursion limit. This data may be from previous work within the last 12 months or from initial exposure assessments on this project. Data from previous work must have been gathered by the firm employed on this contract, using workers trained to the same level, with the ACM and workplace conditions "closely resembling" the conditions for this contract.
14. Contractor Daily Reports: Prepare a written report for each day that asbestos work is being accomplished. The report should be submitted to the the Owner monthly. The report as a minimum shall include the following, where applicable:
 - a. Daily Visual Inspection Reports: Prepare a written report documenting compliance with the Asbestos Hazard Abatement Plan and Federal, State, or local regulations.
 - b. Air Sampling Reports: Complete fiber counting within 24 hours of the "time off" of the sample pump. Notify the the Owner immediately of any airborne levels of asbestos fibers in excess of the acceptable limits. Sampling results shall be submitted to the the Owner the day following receipt. The affected employees will be provided copies of the results where required by law within 3 working days. These results shall be signed by the air sampler and the testing laboratory employee that analyzed the sample.
 - c. Pressure Differential Recordings for Local Exhaust System-Not Used
 - d. Asbestos Disposal Quantity Report: The Contractor shall record and report daily the amount of asbestos containing material removed and the amount transported for disposal. Deliver the report for the previous day and cumulative totals with amounts of material removed reported in linear meters or square meters linear feet or square feet as described initially in this specification and the amounts of material transported for disposal reported in cubic meters yards.

D. Submittals

1. Submit the following in accordance with Section "Submittal Procedures."
 - a. Vacuums and tools
 - b. Respirators
 - c. Wetting Agent
 - d. Safety Data Sheets (SDS) for all materials proposed for transport to the project site
 - e. Local exhaust system
 - f. Pressure differential automatic recording instrument
 - g. Daily Reports
 - h. Asbestos hazard abatement plan
 - i. Testing laboratory
 - j. Training Certificates
 - k. Landfill approval
 - l. Employee training
 - m. Medical certification requirements
 - n. Waste shipment records/Asbestos waste manifest
 - o. Respiratory Protection Program
 - p. Negative Exposure Assessment
 - q. Local Exhaust system
 - r. Show compliance with ANSI Z9.2 by providing manufacturers' certifications.
 - s. Permits, licenses, and Notifications
 - t. Rental equipment
 - u. Respirator program records
 - v. Protective clothing decontamination quality control records
 - w. Protective clothing decontamination facility notification.

E. Quality Assurance

1. Glovebags-Not Used
2. Rental Equipment: Provide a copy of the written notification to the rental company concerning the intended use of the equipment and the possibility of asbestos contamination of the equipment.
3. Protective Clothing Decontamination Quality Control Records: Provide all records that document quality control for the decontamination of reusable outer protective clothing.
4. Protective Clothing Decontamination Facility Notification: Submit written evidence that persons who decontaminate, store, or transport asbestos contaminated clothing used in the performance of this contract were duly notified in accordance with 29 CFR 1926.1101.

1.2 PRODUCTS

A. Encapsulants

1. See Division 21 Section "Facility Fire-Suppression Water-Service Piping".

1.3 EXECUTION

A. Equipment

1. Respirators: Select respirators from those approved by the National Institute for Occupational Safety and Health (NIOSH). Provide personnel engaged in pre-cleaning, cleanup, handling, and removal of asbestos containing materials with the appropriate respiratory protection as specified in 29 CFR 1910.134.
2. Exterior Whole Body Protection
 - a. Outer Protective Clothing: Provide personnel exposed to asbestos with disposable "non-breathable," or reusable "non-breathable" whole body outer protective clothing, head

- coverings, gloves, and foot coverings. Provide disposable plastic or rubber gloves to protect hands. Cloth gloves may be worn inside the plastic or rubber gloves for comfort, but shall not be used alone. Make sleeves secure at the wrists, make foot coverings secure at the ankles, and make clothing secure at the neck by the use of tape. Reusable whole body outer protective clothing shall be either disposed of as asbestos contaminated waste upon exiting from the asbestos regulated work area or be properly decontaminated.
- b. Work Clothing-Not Used
 - c. Decontamination of Reusable Outer Protective Clothing: When reusable outer protective clothing is used, transport the double bagged clothing to a previously notified commercial/industrial decontamination facility for decontamination. Perform non-destructive testing to determine the effectiveness of asbestos decontamination. If representative sampling is used, ensure the statistical validity of the sampling results. If representative sampling is used, reject any entire batch in which any of the pieces exceed 40 fibers per square millimeter. Inspect reusable protective clothing prior to use to ensure that it will provide adequate protection and is not or is not about to become ripped, torn, deteriorated, or damaged, and that it is not visibly contaminated. Notify, in writing, all personnel involved in the decontamination of reusable outer protective clothing as indicated in 29 CFR 1926.1101.
 - d. Eye Protection: Provide goggles to personnel engaged in asbestos abatement operations when the use of a full face respirator is not required.
3. Warning Signs and Labels: Provide bilingual warning signs printed in English and Spanish at all approaches to asbestos control areas. Locate signs at such a distance that personnel may read the sign and take the necessary protective steps required before entering the area. Provide labels and affix to all asbestos materials, scrap, waste, debris, and other products contaminated with asbestos.
- a. Warning Sign: Provide vertical format conforming to 29 CFR 1926.1101 minimum 20 by 14 inches (500 by 355 mm) displaying the following legend in the lower panel:

DANGER
ASBESTOS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
AUTHORIZED PERSONNEL ONLY
WEAR RESPIRATORY PROTECTION AND
PROTECTIVE CLOTHING IN THIS AREA

- b. Warning Labels: Provide labels conforming to 29 CFR 1926.1101 of sufficient size to be clearly legible, displaying the following legend:

DANGER
CONTAINS ASBESTOS FIBERS
MAY CAUSE CANCER
CAUSES DAMAGE TO LUNGS
DO NOT BREATHE DUST
AVOID CREATING DUST

- c. Provide the following asbestos labels, of sufficient size to be clearly legible, for display on waste containers (bags or drums) which will be used to transport asbestos contaminated material in accordance with United States Department of Transportation 49 CFR Parts 171 and 172.

NA2212, (WASTE) ASBESTOS, 9, PGIII

4. Vacuums and Tools: Vacuums shall be leak proof to the filter and equipped with HEPA filters. Filters on vacuums shall conform to ANSI Z9.2 and UL 586. Do not use power tools to remove asbestos containing materials unless the tool is equipped with effective, integral HEPA filtered exhaust ventilation systems. Remove all residual asbestos from reusable tools prior to storage or reuse.
- B. General
1. Pre-Asbestos Work Conference: The Contractor and the Contractor/Supervisor shall meet with the Contracting officer prior to beginning work, to discuss in detail the Asbestos Hazard Abatement Plan, including work procedures and safety precautions. Once approved by the Owners Engineer, the plan will be enforced as if a part of this specification. Any changes required in the specification as a result of the plan shall be identified specifically in the plan to allow for free discussion and approval by the Owners Engineer prior to starting work.
 2. Asbestos Control Area Requirements: The Contractor shall demarcate the asbestos control area(s) using physical barriers and signs to prevent access by unauthorized personnel. This area is defined by 29 CFR 1926.1101 as the regulated area.
 3. Work Procedure: Perform asbestos related work in accordance with 29 CFR 1926.1101, 40 CFR 61-SUBPART M, applicable State or local regulation, and as specified herein. Use wet removal procedures. Personnel shall wear and utilize protective clothing and equipment as specified herein. Eating, smoking, drinking, chewing gum or tobacco, or applying cosmetics shall not be permitted in the asbestos control area(s). Personnel of other trades not engaged in the removal of asbestos containing material shall not be exposed at any time to airborne concentrations of asbestos. If an asbestos fiber release or spill, stop work immediately, correct the condition to the satisfaction of the Owners Engineer, including clean-up and clearance sampling, if appropriate, prior to resumption of work.
 4. Furnishings: Furniture will be removed from the area of work by the Owner before asbestos work begins.
 5. Pre-cleaning: Wet wipe and HEPA vacuum all surfaces potentially contaminated with asbestos prior to establishment of an enclosure.
- C. Removal Procedures: Wet asbestos containing material with a fine spray of amended water during removal, cutting, or other handling so as to reduce the emission of airborne fibers. Remove material and immediately place in 0.15 mm 6 mil plastic disposal bags. Remove asbestos containing material in a gradual manner, with continuous application of the amended water in such a manner that no asbestos material is disturbed prior to being adequately wetted. Where unusual circumstances prohibit the use of 0.15 mm 6 mil plastic bags, submit an alternate proposal for containment of asbestos fibers to the Owner's Engineer for approval. Asbestos containing material shall be containerized while wet. At no time shall asbestos containing material be allowed to accumulate or become dry. Handle asbestos containing material as indicated in 40 CFR 61-SUBPART M, applicable State or local regulation, and 29 CFR 1926.1101.
1. Exposed Pipe Insulation Edges-Not Used
 2. Negative Pressure Enclosure: Block and seal openings in areas where the release of airborne asbestos fibers can be expected. Establish an asbestos negative pressure enclosure with the use of curtains, portable partitions, or other enclosures in order to prevent the escape of asbestos fibers from the contaminated asbestos work area.
 - a. Personnel/Equipment Decontamination Unit: Provide a temporary facility with a separate equipment/dirty change room and clean change room. Provide a shower that complies with 29 CFR 1926.51 in between the dirty room and clean room for personnel required to wear whole body protective clothing. Provide two separate lockers for each asbestos worker, one in each locker room. Keep street clothing and street shoes in the clean locker. HEPA vacuum and remove asbestos contaminated disposable protective clothing while still wearing respirators at the boundary of the asbestos work area and seal in impermeable bags or containers for disposal. Do not wear work clothing between home and work. All

employees shall shower before changing into street clothes. Collect used shower water and filter with approved water filtration equipment to remove asbestos contamination. Dispose of filters and residue as asbestos waste. Discharge clean water to the sanitary system. Dispose of asbestos contaminated work clothing as asbestos contaminated waste or properly decontaminate as specified in the Asbestos Hazard Abatement Plan.

- b. Waste Load-Out Unit: Provide a separate temporary area expressly for short-term storage of bagged asbestos containing material that is ready for disposal. The unit shall be the only port used to transfer waste to a truck, dumpster, or other approved on-site storage facility. It shall not be used for personnel egress. A waste load-out unit shall be integral to each negative pressure enclosure.

3. Non-friable Removal Procedures:

- a. Under normal conditions EPA Category II, non-friable asbestos containing materials may not be considered hazardous; however, this material may release airborne asbestos fibers during demolition and removal; therefore it must be handled in a manner to prevent the release of asbestos fibers. At no time will this material be mechanically chipped, sawed, sanded, or ground.
- b. Prior to beginning removal, establish an Asbestos Control Area and install Critical Barriers as specified elsewhere in this section. Submit a Negative Exposure Assessment which is less than 12 months old to the the Owner for approval or conduct air sampling as specified elsewhere in this section to establish the exposure levels for the exact removal method being used. The Contractor will establish the correct level of Personal Protective Equipment required.
- c. Acceptable methods of removal include, but are not limited to, the use of dry ice, a heat gun or lamp, citrus-based solvents, and hand tools with amended water. Removal shall be accomplished to keep the ACM substantially intact. Breakage into small pieces is an unacceptable work practice. The method shall be detailed in the Asbestos Abatement Plan and shall not be changed during the removal without Contracting Officer approval.
- d. Upon completion of the removal and clean-up, but prior to removal of critical barriers, the Contractor Testing company shall conduct a visual inspection of all areas affected by the removal. Re-clean as required.

D. Field Quality Control Requirements

- 1. Visual Inspections: The the Owner will conduct periodic inspections of all areas where asbestos removal and activities are in progress to ensure compliance with the approved Asbestos Hazard Abatement Plan and Federal/State regulatory requirements. This inspection shall include confirmation of proper control/containment/enclosure, worker protection, housekeeping, exhaust equipment operation, decontamination procedures, proper wetting and disposal, and inspection of work progress and work practices. Each activity will be documented as acceptable or noted as unacceptable with justification for the non-compliance.
- 2. Air Sampling: Sampling of airborne concentrations of asbestos fibers shall be performed in accordance with 29 CFR 1926.1101 and as specified herein. Unless otherwise specified, use NIOSH Method 7400 for sampling and analysis. Air Sampling may be duplicated by the Government at the discretion of the Contracting Officer. If the air sampling results obtained by the Government differ from those results obtained by the Contractor, the Government will determine which results predominate.
 - a. Sampling Prior to Asbestos Work (Not Used)
 - b. Sampling During Asbestos Work
 - 1) The Contractor's testing company shall perform area sampling as indicated in 29 CFR 1926.1101 and governing environmental regulations. Perform area sampling at least once every week close to the work inside the enclosure, outside the personnel/equipment decontamination unit entrance to the enclosure.
 - 2) If sampling outside the enclosure shows airborne levels have exceeded background or 0.01 fibers per cubic centimeter, whichever is greater, stop all work, correct the condition(s) causing the fiber release, and notify the the Owner immediately.

Determine by testing if adjacent areas are contaminated. If so the Contractor shall clean the contaminated areas, visually inspect, and sample the areas as specified herein.

- 3) The Contractor shall conduct personal sampling of at least 25% of the workers engaged in asbestos handling (removal, disposal, transport and other associated work) throughout the duration of the project. If the quantity of airborne asbestos fibers monitored at the breathing zone of the workers at any time exceeds 0.1 fibers per cubic centimeter, notify the PQP immediately, evaluate work practices, and take corrective action to reduce airborne asbestos fibers.

E. Clean-Up And Disposal

1. Housekeeping

- a. Essential parts of asbestos dust control are housekeeping and clean-up procedures. Maintain surfaces of the asbestos control area free of accumulations of asbestos fibers. Give meticulous attention to restricting the spread of dust and debris; keep waste from being distributed over the general area. Use HEPA filtered vacuum cleaners. **DO NOT BLOW DOWN THE SPACE WITH COMPRESSED AIR.** All asbestos waste shall be placed in an approved on-site storage facility or transported for disposal daily. When asbestos removal is complete, all asbestos waste is removed from the work-site, and final clean-up is completed, the PQP shall visually inspect the asbestos control area for cleanliness. After final clean-up and acceptable pre-clearance airborne concentrations are attained but before the local exhaust system is turned off and the negative pressure enclosure removed), remove all pre-filters on the building HVAC system and provide new pre-filters.
- b. Dispose of filters as asbestos contaminated materials. Reestablish HVAC, mechanical, and electrical systems in proper working order.

2. Title to Materials: All waste materials, except as specified otherwise, shall become the property of the Contractor and shall be disposed of as specified in applicable Federal, State, and local regulations and herein.

3. Disposal of Asbestos

- a. Collect all removed asbestos containing material, contaminated materials, contaminated water, scrap, debris, bags, containers, expendable equipment, and asbestos contaminated clothing which may produce airborne asbestos fibers and place in sealed fiber-proof, waterproof, non-returnable containers (e.g. double plastic bags 0.15 mm 6 mils thick, cartons, drums or cans). Wastes within the containers must be adequately wet in accordance with 40 CFR 61-SUBPART M. Affix a warning and Department of Transportation (DOT) label to each container including the bags or use at least 0.15 mm 6 mils thick bags with the approved warnings and DOT labeling preprinted on the bag.
- b. Each container or bag shall clearly indicate that the waste generator is the Owner and the development at which the waste is generated, and the Job Order number of the project.
- c. Prevent contamination of the transport vehicle (especially if the transport vehicle is a rented truck likely to be used in the future for non-asbestos purposes). These precautions include lining the vehicle cargo area with plastic sheeting (similar to work area enclosure) and thorough cleaning of the cargo area after transport and unloading of asbestos debris is complete. Dispose of waste asbestos material at an Environmental Protection Agency (EPA) or State-approved asbestos landfill off the Owner's property. For temporary storage, store sealed impermeable bags in asbestos waste drums or skids. An area for interim storage of asbestos waste-containing drums or skids will be coordinated with the the Owner. Procedure for hauling and disposal shall comply with 40 CFR 61-SUBPART M, State, regional, and local standards. Sealed plastic bags may be dumped from drums into the burial site unless the bags have been broken or damaged. Damaged bags shall remain in the drum and the entire contaminated drum shall be buried. Uncontaminated drums may be recycled. Workers unloading the sealed drums shall wear appropriate respirators and personal protective equipment when handling asbestos materials at the disposal site.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 83 19 13 - LEAD REMEDIATION

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for lead paint related abatement procedures. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. General Provisions

1. The site of this work will be occupied while work is being done. Perform the abatement work with the least inconvenience to the residents.
2. Take all necessary precautions to protect the property of the the Owner and its residents. Damaged property shall be repaired and restored to its original condition. If the damage is beyond repair, the Contractor shall replace it with new materials to match existing, at the Contractor's expense.
3. Hazardous waste generated during the abatement process (including lead-base paint) when carted away from the developments shall not be transferred from one vehicle to another except at a licensed transfer station.
4. Develop a work plan to be performed as requested by the the Owner. The detailed plan shall include sequencing of abatement work in a manner that will be least disruptive to the normal use of the non-work areas in the building. The plan should also include emergency procedures in case of fire.
5. The Contractor shall include all supplementary miscellaneous items not specified but implied or required in order to complete the work.
6. Workmanship required in the execution of the work herein specified shall be of good quality and subject to the approval of the the Owner.
7. Make in a timely fashion all applicable and necessary notifications to relevant Federal, State and Local authorities. The Contractor shall indemnify the the Owner and the the Owner's representative from, and pay all claims resulting from failure to adhere to these provisions.
8. the Owner may retain an independent Monitoring Contractor to monitor the abatement contract and conduct all wipe sampling and clearance tests.
9. Contractor performing lead-based paint abatement or renovation activities involving lead-based paint shall be a Certified Lead Abatement Contractor and shall ensure that supervisors and workers are trained and certified by U.S. EPA approved state program or equivalent, to perform lead paint removal operations.
10. Establish and implement a Chemical Hazard Communication Program as required by OSHA regulations 29 CFR 1926.59.
11. Provide workers with a comprehensive medical examination as required by OSHA regulations 29 CFR 1926.62 before exposure to lead contaminated dust. The medical examination shall be conducted to approve use of appropriate respirators and shall include biological monitoring. NIOSH/MSHA approved respirators shall be utilized.
12. For employees required to wear a negative pressure respirators: conduct a respirator fit test at the time of initial fitting and at least once every six (6) months thereafter as required by OSHA regulations 29 CFR 1926.62.
13. Determine if any worker will be exposed to lead at or above the action level in accordance with OSHA regulation 29 CFR 1926.62 and 29 CFR 1910.1025. Conduct an exposure assessment to identify the level of exposure a worker would be subjected to without respiratory protection. Assess the exposure level by obtaining personal monitoring samples representative of a full shift of at least an 8-hour TWA.
14. Furnish appropriate respirators approved by NIOSH/MSHA for use in atmospheres containing lead aerosols. Instruct workers in all aspects of respiratory protection. Maintain an adequate supply of HEPA filter elements and spare parts on site for all types of respirators in use.

02 - Existing Conditions

15. For manual demolition, scraping, sanding, use of heat gun or power tool paint removal with HEPA collection systems, workers shall minimally use the half-mask negative pressure respirator with high efficiency filters (for airborne concentrations not in excess of 500µg/m³).
16. Ensure that work area preparation, work practices, and clean-up procedures comply with these specifications and applicable Federal, State and Local regulations.
17. Notify all applicable agencies five days prior to the date the abatement will begin and provide evidence of notifications to the the Owner at the pre-start meeting.

C. Submissions

1. Within ten (10) consecutive calendar days calculated from the date of the the Owner's Job Order, the Contractor shall tender all required submissions. Six (6) sets of each submission are required. Where physical samples are required two (2) physical samples shall be submitted for each item. In general, items shall include but not be restricted to the following:
 - a. Paint remover - corner cutter/Vac-Pac System by Pentek Inc; Decontamination Products Division 1026 Fourth Avenue, Corapolis, PA. 15108. Telephone No. (412) 262-0725 or approved equal.
 - b. Description of removal method to be used on each substrate condition including manufacturer's operating instructions and recommendation for equipment usage.
 - c. Copies of current training certificates of Staff to be assigned to the contract.
 - d. List of three previous lead abatement jobs performed successfully by Contractor and name, address, and telephone number of contact person for verification.
2. In the event that all or any portion of the submitted material is rejected by the the Owner, the Contractor shall tender new submissions. All submissions returned for corrections shall be resubmitted with the required corrections within ten(10) consecutive calendar days calculated from the date of rejection, until final submissions are obtained that require no further correction. In no event shall the Contractor be permitted to tender submissions hereunder beyond twenty (20) days from the the Owner's Job Order, unless duly extended in writing by the the Owner.
3. No work shall begin, nor shall the materials be ordered or delivered to the site until final approval of all submissions.

D. Applicable Regulations

1. 24 CFR Part 35
2. HUD "Guidelines For the Evaluation and Control of Lead-Based Paint Hazards in Housing"
3. Abatement work shall also be in accordance with applicable regulations of the Environmental Protection Agency (EPA), Occupational Safety & Health Agency (OSHA) and any State or Local LBP standards. Where there is a conflict between Federal, State or Local regulations, the more stringent requirement shall prevail.
4. OSHA Standards
 - a. 29 CFR 1926.20 General safety and health provisions;
 - b. 29 CFR 1926.21 Safety training and education;
 - c. 29 CFR 1925.25 Housekeeping;
 - d. 29 CFR 1926-28 Personal protective equipment;
 - e. 29 CFR 1926.51(f) Washing facilities;
 - f. 29 CFR 1926.55 Gases, vapors, fumes, dusts, and mists;
 - g. 29 CFR 1926.57 Ventilation
 - h. 29 CFR 1926.59 Hazardous Communication Standards;
 - i. 29 CFR 1926.103 Respiratory protection, and
 - j. 29 CFR 1926.62 Lead in Construction
5. The Contractor must comply with all applicable requirements of the Resource Conservation & Recovery Act (RCRA) of 1976 as amended in 1980 and 1984 by the Hazardous & Solid Waste Amendments (HSWA).
6. These Specifications refer to many requirements found in the preceding references but in no way is it intended to cite or reiterate all provisions therein or elsewhere. It is the Contractor's responsibility to obtain a copy, and know, understand and abide by all such regulations, guidelines and common practices.

1.2 PRODUCTS – (not used)

1.3 EXECUTION

A. Abatement

1. Have risk assessment or paint inspection performed by certified risk assessor or a certified inspector technician who is independent of the abatement contractor.
2. Develop a site specific lead hazard control plan, reviewed and signed by an asbestos consultant (LAC) who is licensed in the State in which the work is to be performed, and submit for review and approval to the the Owner.
3. Obtain any necessary building or waste permits, notify local authorities as required by applicable codes and laws.
4. Select specific building component replacement items, enclosure materials, paint removal equipment and/or chemicals, tools, and cleaning supplies. Consider waste management and historical preservation implications of selected treatment.
5. Develop project specific specifications.
6. Schedule other work so that leaded surfaces are not inadvertently disturbed and unprotected workers are not place at risk. Include time for clearance examinations and laboratory dust sample analysis in the scheduling process.
7. Select a certified abatement subcontractor.
8. Conduct a pre-construction conference to ensure that the subcontractor fully understands the work involved.
9. Notify residents of the dwelling and adjacent dwellings of the work and date it will begin. Coordinate this with the the Owner.
10. Correct any existing conditions that could impede the abatement work (i.e. trash removal, structural deficiencies).
11. Post warning signs and restrict entry to work area to authorized personnel. Implement worksite preparation procedures.
 - a. Place proper warning signs required by OSHA regulations at all entrances to the work area. Signage shall be minimum of 12" x 20" and shall state the following:

**WARNING
LEAD WORK AREA
POISON
NO SMOKING OR EATING**

12. Coordinate test, pilot or sample portion approach to the project with the Owner.
13. Shut-down forced air heating, ventilation and air conditioning systems and cover all vents, diffusers, windows etc., with a single layer six-mil polyethylene sheet secured with duct tape. Exceptions shall be for minor disturbances of area less than 2 square feet and where if vents, diffusers, and windows are more than 5 feet away from surface being disturbed, they need not be covered.
14. Collect preabatement soil samples, which may not have to be analyzed until post abatement soil samples have been collected, analyzed, and compared to clearance standards. If postabatement soil levels are below applicable limits, the preabatement samples need not be analyzed.
15. Cover entrances to the work area with a single layer of 6 mil polyethylene sheets taped to the top and weighted at bottom.
16. Rig a containment non-flammable polyethylene sheet underneath the work area. This containment method should catch all stripped paint for proper disposal.
17. Execute abatement work.
18. Avoid spreading dust and debris outside the work area.
19. Store all waste in a secure area and make sure it is properly labeled with an accumulation start date.
20. Conduct daily and final cleanup.
21. Execute waste disposal procedures.

02 - Existing Conditions

22. Maintain appropriate records.

B. Paint Removal

1. Do not use the following prohibited paint removal methods:
 - a. Dry scraping or sanding (except for limited areas)
 - b. Use of heat gun over 1,100°F
 - c. Open flame burning or torching
 - d. Machine sanding or grinding without HEPA vacuum exhaust tool
 - e. Abrasive blasting or sandblasting without HEPA vacuum exhaust tool
 - f. Uncontained hydro blasting or high-pressure wash
 - g. Use of chemical strippers containing Methylene chloride.
2. Select the appropriate worksite preparation level.
3. For heat gun work, provide fire extinguishers in the work area and ensure that adequate electrical power is available. Use for limited areas only. Train workers to avoid gouging or abrading the substrate.
4. For mechanical removal methods, use tools equipped with HEPA exhaust capability. Be sure workers keep the shroud against the surface being treated. Vacuum blasting and needle guns should not be used on wood, plaster, drywall, or other soft substrates. Observe all manufacturers directions for the amount of vacuum airflow required.
5. For wet scraping, use a spray bottle or wet sponge attached to the scraper to keep the surface wet while scraping. Apply enough water to moisten the surface completely, but not so much that large amounts of water run onto the ground or floor. Do not moisten areas near electrical circuits.
6. For chemical paint removers, determine if the building component can be removed and stripped offsite. Offsite stripping is generally preferred to onsite paint removal. Observe all manufacturers' directions for use of paint removers.
7. For offsite stripping, determine how to remove the component. Score the edges with a knife or razor blade to minimize the damage to adjacent surfaces. Punch or tag the building component, if similar building components are also being stripped offsite (i.e. doors). This will ensure that the individual component is reinstalled in the same location. Inform the offsite paint remover that the lead-based paint component is present for shipping. Wrap the component in plastic and send to the offsite stripping location. Clean all surfaces before reinstallation and remove any lead residue by HEPA vacuuming all surfaces, cleaning with other lead-specific cleaners, or phosphate detergents, and HEPA vacuuming again.
8. For onsite paint removal, first test the product on a small area to determine its effectiveness. Chemical paint removers may not be effective or desirable on exterior, deteriorated wood surfaces, aluminum, and glass. Provide neoprene, nitrile, rubber, or polyvinyl chloride (PVC) gloves (or other type of glove recommended by the manufacture); face shields; respirators with combination filter cartridges for lead dust and organic vapors(if appropriate); and chemically resistant clothing. Be sure to select the right type of organic vapor filter cartridge, gloves, and clothing for the specific chemical being used. Portable eyewash stations capable of providing a 15-minute flow must be on-site. Apply the chemical and wait the required period of time. Securely store chemical s overnight. For caustic chemical paint removers, neutralize the surface before repainting using glacial acetic acid (not vinegar). Repaint.
9. Make sure all debris is caught in the containment sheet for proper disposal.
10. Mark and legally dispose of waste in accordance with all applicable Federal, State and Local regulations. Most wastes from paint removal projects, such as paint chips and paint remover sludge, will need to be managed as hazardous waste.
11. Conduct clean-up
12. Have a certified risk assessor or inspector technician conduct a clearance examination and provide documentation and a Statement of Lead-Based Paint Compliance.

C. Building Component Replacement

1. Prepare work area by selecting proper worksite preparation level.
2. Prepare the hazardous material building component for removal. Turn off and disconnect any electrical circuits inside or near the building component to be removed.

3. Lightly mist the component to be removed (unless electrical circuits are located nearby).
 4. Score all painted seams with a sharp knife.
 5. Remove any screw, nails, or other fasteners.
 6. Use flat pry instrument and hammer to pry component from the substrate.
 7. Remove or bend back all nails.
 8. Wrap and seal all bulk components in plastic and take them to a covered truck or secured waste storage area along a pathway covered in plastic. Shovel any debris. Dispose of properly.
 9. HEPA vacuum any dust or chips in the area where the component was located.
 10. Conduct cleaning and clearance activities.
- D. Soil and Exterior Dust Abatement
1. Determine if soil lead hazard exists. For hazard to exist, a total of at least 9 square feet of soil in a single yard or area must be bare and soil concentrations must exceed 2,000µg/gram lead for the yard or building perimeter or 400µg/gram of lead for small, high-contact play areas (pending the development of an EPA soil standard). Bare soil above these levels shall be treated by either interim controls or abatement. Soil abatement is most appropriate when levels of lead are extraordinarily high (greater than 5,000µg/gram lead) and when use patterns indicate contact frequency and exposure will be high.
 2. Collect Preabatement soil samples to determine baseline levels. These samples need not be analyzed if post abatement samples are below applicable clearance levels.
 3. Determine the method of soil abatement (soil removal and replacement, soil cleaning, or paving). Soil cultivation (rototilling or turning over the soil) is not permitted.
 4. If paving, use a high quality concrete or asphalt. Observe normal precautions associate with traffic load weight and thermal expansion and contraction. Obtain necessary permits. Keep soil cultivation to a minimum.
 5. If removing and replacing soil.
 - a. Determine if waste soil will be placed in an offsite burial pit. Prepare vehicle operation and soil movement plan. Test new replacement soil (should not contain more than 200 µg/gram lead).
 - b. Contact local utilities to determine location of underground utilities including water, gas, cable TV, electric, telephone, and sewer. Mark all locations to be avoided
 - c. Remove fencing, if necessary to allow equipment access and define set limits with temporary fencing, signs, or yellow caution tape.
 - d. Tie and protect existing trees, shrubs, and bushes.
 - e. Have enough tools to avoid handling clean soil with contaminated tools.
 - f. Remove soil.
 - g. Clean all walkways, driveways, and street areas near abatement area.
 - h. Replace soil at proper grade to allow drainage. Replacement soil should be at least 2 inches above existing grade to allow for settling.
 - i. Install new soil covering (grass or sod) and maintain it through the growing season.
 - j. Determine if soil waste is hazardous and manage it accordingly
 - k. Conduct clean-up and clearance.
 - l. Provide walk-off doormats.
 - m. Maintain proper documentation.
- E. Encapsulation
1. Determine if the applicable regulations allow encapsulation to be used. Do not encapsulate the following surfaces:
 - a. Friction surfaces, such as window jambs and door jambs.
 - b. Surfaces that fail patch tests.
 - c. Surfaces with substrates or existing coatings that have a high level of deterioration.
 - d. Surfaces in which there is a known incompatibility between two existing paint layers.
 - e. Surfaces that cannot support the additional weight stress of encapsulation due to existing paint thickness.
 - f. Metal surfaces that are prone to rust or corrosion.
 2. Conduct field tests of surfaces to be encapsulated for paint film integrity.

02 - Existing Conditions

3. Consider special use and environmental requirements (i.e. abrasion resistance and ability to span base substrate cracks).
4. Provide to the the Owner encapsulant test data provided by the manufacturer.
5. Conduct at least one test patch on each type of building component where the encapsulant will be used. Report the results to the the Owner.
6. For both nonreinforced and reinforced coatings, use a 6" x 6" test patch area. Prepare the surface in the manner selected to complete the job. Prepared surfaces for patch testing should be at least 2" larger in each direction than the patch area.
7. For fiber-reinforced wall coverings, use 3" x 3" patch. For rigid coatings that cannot be cut with a knife, use soundness test. For all encapsulants, carry out the appropriate adhesion tests.
8. For liquid coating encapsulants, allow coating to cure, then visually examine it for wrinkling, blistering, cracking, bubbling, or other chemical reaction with the underlying paint.
9. Record results of all patch tests and provide to the the Owner.
10. Implement proper work site preparation level.
11. Repair all building components and substrates as needed (i.e. caulk cracks and repair sources of water leaks).
12. Prepare surfaces. Remove all dirt, grease, chalking paint, mildew and other surface contaminants, remnants of cleaning solutions, and loose paint. All surfaces should be deglossed, as needed.
13. Ventilate the contaminated area whenever solvents or chemicals are used.
14. During encapsulant application or installation, monitor temperature and humidity. For liquid coatings monitor coating thickness to ensure that the encapsulant manufacturer's installation/application specifications are followed.
15. Conduct clean up and clearance.
16. Provide the the Owner information on how to care for the encapsulation system properly.
17. Maintain records on the exact detailed locations of encapsulant applications, patch test specifications and results, product name, subcontractor, date of application, a copy of the product label and Safety Data Sheet (SDS) for the product and provide to the the Owner.

F. Enclosure

1. Stamp, label or stencil all lead-based painted surfaces that will be enclosed with a warning approximately every 2 feet both horizontally and vertically on all components. The Warning shall read "**Danger Lead-Based Paint**". Deteriorated paint should not be removed from the surface to be enclosed.
2. Select the proper worksite preparation level.
3. Attach a durable drawing to the utility room closet showing where lead-based paint has been enclosed in the dwelling.
4. An independent inspector or technician or risk assessor should evaluate the integrity of the enclosure.
5. Repair any unsound substrates and structural members that will support the enclosure, if necessary.
6. Utilize appropriate enclosure material (drywall or fiberboard, wood paneling, laminated products, ridged tile and brick veneers, vinyl, aluminum m, or plywood).
7. Install extension rings for all electrical switches and outlets that will penetrate the enclosure.
8. If enclosing floors, remove all dirt with a HEPA vacuum to avoid small lumps in the new flooring.
9. Seal and back-caulk all seams and joints. Back-caulk means applying caulk to the underside of the enclosure.
10. When installing enclosure directly to painted surfaces, use adhesive and then anchor with mechanical fasteners (screws or nails).
11. Conduct clean up and clearance activities.
12. Maintain proper records and submit a Statement of Lead-Based Paint Compliance.

G. Final Cleaning Procedures

1. Use the following step-by-step procedures

- a. Assign responsibilities to specific workers for cleaning and for maintaining the cleaning equipment.
 - b. Have sufficient cleaning equipment and supplies before beginning work.
 - c. If contamination is extensive, conduct precleaning of the dwelling unit.
 - d. Conduct ongoing cleaning during the job, including regular removal of large and small debris and dust. Decontamination of all tools, equipment and worker protection gear is required before it leaves contaminated areas. Electrical equipment should be wiped and high-efficiency particulate air (HEPA) vacuumed, not wetted down, to minimize electrocution hazards.
 - e. Schedule sufficient time (usually 30 minutes to an hour) for complete daily cleaning, starting at the same time near the end of every workday after lead hazard control activity has stopped.
 - f. For final cleaning, wait at least 1 hour after active lead hazard control activity has ceased to let dust particles settle.
 - g. Use a vacuum cleaner equipped with a HEPA exhaust filter. HEPA vacuum all surfaces in the room (ceilings, walls, trim, and floors). Start with the ceiling and work down, moving toward the entry door. Completely clean each room before moving on.
 - h. Wash all surfaces with lead-specific detergent, high-phosphate detergent, or other suitable cleaning agent to dislodge any ground-in contamination, then rinse. Change the cleaning solution after every room is cleaned.
 - i. Repeat step g above. To meet clearance standards consistently, a HEPA vacuum, wet wash, and HEPA vacuum cycle is recommended. For interim control projects involving dust removal only, the final HEPA vacuuming step is usually not needed. Other cleaning methods are acceptable, as long as clearance criteria are met and workers are not over exposed.
 - j. After final cleaning perform visual examination to ensure that all surfaces requiring lead hazard control have been addressed and all visible dust and debris have been removed. Record findings and correct any incomplete work.
 - k. If other construction work will disturb the lead-based paint surfaces, it should be completed at this point. If those surfaces are disturbed, repeat the final cleaning step after construction work has been completed.
 - l. Paint and otherwise seal treated surfaces and interior floors.
 - m. Conduct clearance examination.
 - n. If clearance is not achieved, repeat final cleaning.
 - o. Continue clearance testing and repeated cleanings until dwelling unit achieves compliance with all clearance standards. The cost of repeated cleaning, after failure to achieve clearance is to be borne by the contractor.
 - p. Do not allow residents to enter work area until final cleaning is completed and clearance is established.
 - q. Cleaning equipment list is as follows:
 - 1) HEPA Vacuums
 - 2) Detergent
 - 3) Waterproof gloves
 - 4) Rags
 - 5) Sponges
 - 6) Mops
 - 7) Buckets
 - 8) HEPA vacuum attachments (crevice tools, beater bar for cleaning rugs)
 - 9) 6-mil plastic bags
 - 10) Debris containers
 - 11) Waste water containers
 - 12) Shovels
 - 13) Rakes
 - 14) Water-misting sprayers
 - 15) 6-mil polyethylene sheeting (or equivalent)
2. Order of execution for final cleaning steps should be as follows:

02 - Existing Conditions

- a. As the first stage in final cleaning, floor plastic shall be misted and swept.
- b. Upper level plastic, such as on cabinets and counters should be removed first, after it has been misted and cleaned. All plastic should be carefully folded from the corners/ends to the middle to trap any remaining dust. Next remove both layers of plastic from the floor.
- c. Plastic sheets used to isolate contaminated rooms from noncontaminated rooms should remain in place until after cleaning and removal of other plastic sheeting, these sheets may then be misted, cleaned and removed last.
- d. Removed plastic should be placed into double 4-mil or single 6-mil plastic bags, or plastic bags with equivalent (or better) performance characteristics, which are sealed and removed from the premises. As with daily cleanings, this plastic removal process usually requires workers to use protective clothing and respirators.
- e. After plastic has been removed from the contaminated area, the entire area should be cleaned using the HEPA/wet wash/HEPA cycle.

H. Waste Testing And Disposal

1. General: All materials, whether hazardous or non-hazardous shall be properly disposed of. the Owner may hire an independent Monitoring Consultant to perform TCLP test to determine which of the wastes are hazardous. Contractor shall cooperate in this test. If less than 100kg (200 lbs) or 1/2 of a 55 gallon drum of hazardous waste per month will be generated, it is considered "conditionally exempt" abatement waste, and may be managed as solid non-hazardous waste. The RCRA hazardous waste manifest is not required when shipping this waste to an offsite disposal facility.
2. Separate Abatement Waste into The Following Four Categories:
 - a. Category I. Low lead waste (typically non-hazardous) e.g. Filtered personal and commercial wash water.
 - b. Category II. Architectural components - (painted finish carpentry items) e.g. Doors, windows, window trim and sills, baseboards, railings, moldings. (May do a TCLP to determine if they are hazardous).
 - c. Category III. Concentrated lead waste e.g. sludge from stripping, lead-base paint chip and dust, HEPA vacuum debris and filter, unfiltered wash waste, any waste included in EPA's list of hazardous waste.
 - d. Category IV. Material that cannot be determined to be either hazardous or non-hazardous must be tested by TCLP.

If the hazardous waste generated is greater than 100kg per month, dispose according to the referenced guidelines and RCRA hazardous waste management requirements including those listed below.

3. Disposal Requirements: Contact the regional EPA, state, local and all other pertinent authorities to determine lead-based paint debris disposal requirements. Comply with requirements of the Resource Conservation and Recovery Act (RCRA) and with applicable federal, state, county, or local waste requirements.
4. EPA ID Numbers: Obtain a Generator RCRA Hazardous Material ID number and coordinate this action through the State and secure any additional number as required.
5. Storage Requirements: Keep all hazardous items in a secure area or lockable container that is inaccessible to all persons other than the Contractor's personnel. Label all hazardous waste "Hazardous Waste" with the date that the Contractor began to collect the waste in that container. Keep hazardous and non-hazardous waste in separate containers. Until TCLP testing is completed, considered all items hazardous and store in a secured area or lockable container.
6. Waste Transportation: Transport hazardous waste using a RCRA/DOT/EPA certified Hazardous Waste Transporter. Submit names and qualifications of certified transporter/hauler for the Owner approval. The Contractor shall be responsible for all actions of the waste hauler as pertaining to waste removal and disposal under these procedures and all EPA, DOT and other applicable regulations.
7. Disposal Facility: Supply documents that detail the site(s) to be used for ultimate disposal. Submit documents from these sites proving that they are licensed/permitted to accept such waste and shall accept the waste proposed by the Contractor for treatment or ultimate disposal.

8. Waste Containers: Comply with EPA and DOT regulations for waste containers. Contact the state and local authorities to determine their criteria for containers. In the case of any conflict in regulations, the more stringent shall apply.
 9. Emergencies: Contact local fire, police, hospitals or local emergency response teams and inform them of the type of hazardous waste activity and ask for assistance in the event of any accident. Additionally, the container shall provide the following:
 - a. Keep and properly maintain a suitable fire extinguisher(s) on site.
 - b. Have a immediate means of communication with the regulatory agency in the event of an emergency.
 - c. Keep a list of phone numbers of regulatory agencies on site.
 - d. Appoint an emergency coordinator and ensure the coordinator is on site to supervise emergency procedures to be carried out in the event of an emergency.
 - e. Keep and maintain a "right to know" manual that is in an easily accessible location and in an area that is known to all employees.
 10. Transporting Waste: Provide certifications that the transporter is registered with the U.S. Department of Transportation is required by 49 CFR Part 107(a) transport hazardous waste.
 - a. Provide certifications that each vehicle dedicated to haul hazardous waste has been assigned a "U.S. DOT Hazardous Material Registration Number" as required by 49 CFR Part 107.
 - b. Be responsible for all other applicable permits pertaining to hauling, transport, reduction, and disposal of hazardous waste as they may apply to this project.
 - c. Vehicle: Ensure that all non-hazardous waste is transported in covered vehicles to a landfill, or lined landfill, if required.
 - d. Container Handling: Carefully place the containers into the truck or dumpster used for disposal. At no time shall debris or containers be thrown or dropped.
 - e. Liquid Wastes: Contain and properly dispose of all liquid wastes, including lead-contaminated wash water.
 - f. Containers: HEPA vacuum the exterior of all waste containers prior to removing the waste containers from the work area. Wet wipe the containers to ensure that there is no residual contamination. Then move containers out of the work area into the designated storage area.
- I. Clearance
1. Clearance on all abatement projects must be done by an independent certified risk assessor or inspector technician. Follow all jurisdictional law with regard to licensure requirements for personnel conducting clearance activities.
 2. Clearance step-by-step procedures are as follows:
 - a. Finish the lead hazard control clean-up effort. Seal floors before clearance (if necessary).
 - b. Wait 1 hour to allow any airborne dust to settle. Do not enter work area during that hour.
 - c. Conduct visual examination
 - 1) Determine if all required work has been completed and all lead-based paint hazards have been controlled.
 - 2) Determine if there is visible settled dust, paint chips, or debris in the interior or around the exterior.
 - d. Complete the Visual Clearance Form required by the the Owner; if all work is not completed inform the the Owner and order completion of the work and repeat cleanup, if necessary.
 - e. Conduct clearance dust sampling of the floors, interior window sills, and window troughs using approved protocol.
 - f. Conduct soil sampling if bare soil is present that was not sampled previously, or if exterior paint work was completed as part of the lead hazard control effort. Whenever exterior work has been don, it may be necessary to take samples from the soil that is not bare to determine if contamination has occurred. If results are above 1,000 µg/g (or 400 µg/g in high contact play area), compare the results to baseline soil sampling results to determine what additional measures are needed.
 - g. Complete the Dust and Soil Sampling Clearance Form required by the the Owner.

- h. Submit samples to a U.S. Environmental Protection Agency (EPA) recognized laboratory participating in the National Lead Laboratory Accreditation program (NLLAP) for analysis.
- i. Interpret results by comparing them to Interim Clearance Standards as listed below:
 - 1) Floors 400 µg/ft²
 - 2) Window sills 250 µg/ft²
 - 3) Window Troughs 800 µg/ft²
 - 4) Soils (Play area with children under 6 years of age) 400 µg/gram
- j. If clearance is achieved go to step N.
- k. Order repeated cleanings or soil treatments if results are above applicable standards. Clean all surfaces the sample represents.
- l. Continue sampling and repeated cleanings until the dwelling achieves compliance with all applicable clearance standards.
- m. Complete any related construction work that does not disturb a surface with lead-based paint (all work that does disturb painted surfaces or that could generate lead dust should be completed as part of the lead hazard control effort).
- n. Issue any necessary statements of lead-based paint compliance or releases and maintain appropriate records.

J. Labels

- 1. Use the following labels on drums used for disposal.

**HAZARDOUS
WASTE**

FEDERAL LAW PROHIBITS IMPROPER DISPOSAL.

K. Disposal of lead-based paint waste.

1. Follow the RCRA and HUD recommended practices as defined in the table below:

Waste Management Practices	Category I: Low Lead Waste	Category II: Architectural Components	Category III: Concentrated Lead Waste	Category IV: Other waste
RCRA Requirements	Manage as nonhazardous Waste	Depending upon knowledge or TCLP testing results, manage as solid hazardous or nonhazardous waste	If more than 100 kg/ month, manage as hazardous waste. If less than 100 kg/month manage as solid waste.	Use TCP to determine if waste is hazardous.
HUD Recommended Practices	Applicable	Applicable, if knowledge or TCLP testing indicates that it is nonhazardous.	Applicable if less than 100 kg/month otherwise subject to full RCRA regulations	Only applicable if TCLP testing shows waste is nonhazardous
Wrapped in plastic; seal all seams with tape (if acceptable to the disposal facility).	X	X	X	X
Stored in designated, secure area.	X	X	X	X
Covered During Transport	X	X	X	X
Prohibit cutting/breaking outside work area.	X	X	X	X
Cover ground with 6-mil plastic if handling outside.	X	X	X	X
Prohibit disposal in solid waste incinerators and reuse recycling for mulch	X	X	X	X
Recommended disposal in State licensed/permitted	X	X	If appropriate.	X

solid waste landfill.

L. Safety Requirements

1. To protect the health and safety of all persons involved, it is of the utmost importance that deleading is safely and correctly done in a timely manner. The following specific safety requirements are the responsibility of the Deleading Contractor.

K. General Safety:

1. General
 - a. NO ONE is to be allowed in the work area without an approved respirator except for methods that have been documented not requiring a respirator.
 - b. Each work area must be sealed from the remainder of the dwelling by taping plastic sheets (6 mil thick). Work areas must remain sealed off until both work and clean-up are completed.
 - c. Cover all floors, carpets, furniture and appliances with 6 mil plastic within the work area. Use automotive masking tape (2 inches wide) to seal all edges and seams.
 - d. Make certain all electrical connections are properly grounded.
 - e. At least three days prior to the start of any deleading work, post appropriate warning signs at all entrances and exits of work areas and leave in place until all clearance testing indicates that these areas are safe for re-occupancy. The signs must include the following phrase: "CAUTION LEAD HAZARD-KEEP OUT". Post bilingual signs when necessary.
2. Worker Safety: The Deleading Contractor shall take the following minimum precautions to protect the health of all individuals involved in the deleading process.
 - a. Pre-Abatement Medical Exam: Each employee shall undergo a medical examination to determine both respiratory fitness capability and also pre-existing/current blood lead level. Said results shall be provided to the employee and also to the Owner within 3 days of receipt of same, and in all cases, prior to employee's commencement to active abatement. Records of same are required to be kept by the Contractor for 40 years.
 - b. Medical Surveillance is the monitoring of worker blood levels. It is required that the Contractor have blood level monitoring of all active abatement and clean-up workmen and on-site supervisors performed and said results provided to the Owner.
 - 1) Before assignment to active abatement activity for each worker.
 - 2) 30 days after active abatement has begun.
 - 3) At least every two months during the first six months and every six months throughout the deleading job.
 - 4) At least every two months for each employee whose blood lead analysis indicated a blood lead level at or above 25 micrograms per deciliter. (20 micrograms per deciliter for women of child bearing age).
 - 5) At termination of employment.
 - 6) Contractor shall reassign any employee whose blood lead has reached 25 µg/dl (20 µg/dl for women of child bearing age) to a job function deemed safe from lead exposure. Said employee shall remain away from active abatement until such time as 2 consecutive months' blood tests indicate µg/dl below 20 µg/dl.
 - c. Respiratory Protection Programs must be established by the Contractor in accordance with OSHA regulations and qualitative respirator fit testing must be conducted daily by the on-site supervisor. Medical examinations must be performed by a physician prior to fit testing and at anytime when a worker demonstrates any difficulty breathing during the use of or the fit testing of respirators. The following are minimal acceptable respiratory protection program requirements as set up and administered by the Contractor:
 - 1) Written standard operating procedures which oversees the selection and use of respirators.
 - 2) Selection of respirators on the basis of hazards to which the worker is exposed.
 - 3) Worker training on the limitations and use of respirators (includes fit testing).
 - 4) Individual workers assigned respirators for their exclusive use only.

02 - Existing Conditions

- 5) Daily cleaning and disinfecting of respirators.
- 6) Proper storage of all respirators.
- 7) Proper inspection of all respirators for wear and tear.
- 8) Continual surveillance of work area conditions and level of worker exposure or stress.
- 9) Use of approved respirators only, modified as needed by the weekly exposure monitoring results.
- 10) Supply weekly report covering items 1-9 to the Owner or its Lead Consultant.
- d. Exposure Monitoring is the measured concentration of lead in the workers breathing zones. The Contractor shall perform personnel monitoring during active abatement using the NIOSH 7072 method and shall be responsible for:
 - 1) Monitoring the level of worker protection needed during the abatement process;
 - 2) Evaluating, modifying and improving any engineering and work practice control(s) as needed;
 - 3) Evaluating each employee's personal quality of work and any need for additional worker training or safety instruction;
 - 4) Providing the Owner results of all personnel monitoring tests within 10 days of testing; and
 - 5) Providing half-face APR respirators with HEPA filters unless said monitoring test results dictate differently. OSHA guidelines shall be used to determine respirator PEL protection factors.
- e. Protective Clothing Equipment must be provided to all workers to help assure that lead dust is contained to the work areas. The following must be supplied/enforced by the Deleading Contractor:
 - 1) Full body protective clothing and shoe covers of appropriate sizes on a daily basis or as needed.
 - 2) Clean changing areas separated from the dirty/contaminated clothes storage area.
 - 3) Water and wash facilities for washing of hands and face and shower facilities if deemed necessary by the Owner's Lead Advisor.
 - 4) Instructing worker on proper maintenance of clothing and equipment.
 - 5) Proper disposal of disposable clothing and proper permanent work clothes.
 - 6) Enforcing the removal of protective clothing at the end of each work day and before eating, drinking and smoking.
 - 7) Enforcement of the removal of protective shoe covers before leaving work area.
3. Contractor/Worker Daily Safe-Work Procedures
 - a. Daily Start-Up:
 - 1) Workers to put on protective gear prior to entering work areas.
 - 2) All garment seams to be sealed with duct tape.
 - 3) All non-working garments must be stored in designated changing area.
 - 4) Respirators, as required, must be properly fitted before entering work area. Perform qualitative fit test.
 - b. Temporary depart:
 - 1) All protective clothing to be HEPA vacuumed while still being worn.
 - 2) All shoe covers to be removed and left in the work area (immediate departure upon removing).
 - 3) Remove all protective gear in designated "contaminated" changing area before eating, drinking, and smoking or before leaving work site.
 - 4) Wash hands and face.
 - 5) Clean respirators.
 - c. Daily Shut-Down:
 - 1) Dispose of protective clothing with abatement waste by sealing in a 6 mil poly bag.
 - 2) Laundered clothes must be placed in closed container.
 - 3) Wash hands and face.
 - 4) Shower if facilities allow and circumstances dictate.
 - 5) Clean all protective gear (respirators included).

4. Tenant's Safety: Temporary relocation of the tenants is necessary if the lead paint surface is broken. Temporary relocation of the tenants and their belongings is the responsibility of the Owner. However, the Contractor has the joint responsibility to administer and enforce the following safety practices on behalf of the occupants:
 - a. Adults
 - 1) NO OCCUPANT is allowed to enter the work area during paint removal and initial clean-up. A three day clean-up and settlement period may be imposed depending upon the abatement procedures used, at the discretion of the Owner or their Lead Consultant.
 - 2) the Owner shall notify all occupants in writing when they are allowed to return to their post-abated residence. Contractor shall abide by these notices.
 - 3) Every resident who has received prior notice of abatement is responsible for placing all personal items (clothing, dishes, linens, etc.) in closed, easy to handle containers; and move such items to the center of each room as requested.
 - 4) As long as visible dust remains, occupants may not occupy dwelling, and all surfaces within the dwelling must be re-washed with trisodium phosphate and HEPA vacuumed by deleading contractor.
 - 5) Persons reoccupying dwellings following abatement are required to report any visible dust or debris to the Owner immediately for additional Contractor clean-up.
 - b. Pregnant Women and Children
 - 1) Absolutely no pregnant women nor children under the age of twelve years of age may be allowed in the building while any part of the abatement process is going on.

END OF SECTION 02 83 19 13

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 83 19 13a - LEAD-BASED PAINT REMEDIATION

1.1 GENERAL

A. Description Of Work

1. This specification covers the removal and disposal of lead-based or lead-containing paint. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Definitions

1. Action Level: Employee exposure, without regard to use of respirators, to an airborne concentration of lead of 30 micrograms per cubic meter of air averaged over an 8 hour period in an occupational/industrial environment.
2. Area Sampling: Sampling of lead concentrations within the lead control area and inside the physical boundaries which is representative of the airborne lead concentrations but is not collected in the breathing zone of personnel.
3. Competent Person (CP): As used in this section, refers to a person employed by the Contractor who is trained in the recognition and control of lead hazards in accordance with current federal, State, and local regulations. An industrial hygienist or safety professional certified for comprehensive practice by the American Board of Industrial Hygiene or by the Board of Certified Safety Professionals is the best choice.
4. Contaminated Room: Room for removal of contaminated personal protective equipment (PPE).
5. Decontamination Shower Facility: That facility that encompasses a clean clothing storage room, and a contaminated clothing storage and disposal rooms, with a shower facility in between.
6. Eight-Hour Time Weighted Average (TWA): Airborne concentration of lead to which an employee is exposed, averaged over an 8 hour workday as indicated in 29 CFR 1926.62.
7. High Efficiency Particulate Air (HEPA) Filter Equipment: HEPA filtered vacuuming equipment with a UL 586 filter system capable of collecting and retaining lead-contaminated paint dust. A high efficiency particulate filter means 99.97 percent efficient against 0.3 micron or larger size particles.
8. Lead: Metallic lead, inorganic lead compounds, and organic lead soaps.
9. Lead-Based Paint (LBP): Paint or other surface coating that contains lead in excess of 1.0 milligrams per centimeter squared or 0.5 percent by weight.
10. Lead-Based Paint Hazard (LBP Hazard): Any condition that causes exposure to lead from lead-contaminated dust, lead-contaminated soil, lead-based paint that is deteriorated or present in accessible surfaces, friction surfaces, or impact surfaces that would result in adverse human health effects.
11. Lead-Containing Paint (LCP): Lead-based paint or other similar surface coating containing lead or lead compound in excess of 0.06 percent by weight of the total nonvolatile content of the paint.
12. Lead Control Area: An enclosed area or structure, constructed as a temporary containment equipped with HEPA filtered local exhaust, which prevents the spread of lead dust, paint chips, or debris existing as a condition of lead-based paint removal operations. The lead control area is also isolated by physical boundaries to prevent unauthorized entry of personnel.
13. Lead Permissible Exposure Limit (PEL): Fifty micrograms per cubic meter of air as an 8 hour time weighted average as determined by 29 CFR 1926.62. If an employee is exposed for more than eight hours in a work day, the PEL shall be determined by the following formula:
$$\text{PEL (micrograms/cubic meter of air)} = 400/\text{No. hrs. worked per day.}$$
14. Personal Sampling: Sampling of airborne lead concentrations within the breathing zone of an employee to determine the 8 hour time weighted average concentration in accordance with 29 CFR 1926.62. Samples shall be representative of the employees' work tasks. Breathing zone shall be considered an area within a hemisphere, forward of the shoulders, with a radius of **6 to 9 inches (150 to 225 mm)** and centered at the nose or mouth of an employee.

02 - Existing Conditions

15. Physical Boundary: Area physically roped or partitioned off around an enclosed lead control area to limit unauthorized entry of personnel. As used in this section, "inside boundary" shall mean the same as "outside lead control area but inside boundary."

C. Submittals: Submit the following:

1. Product Data:
 - a. Vacuum filters
 - b. Respirators
2. Test Reports
 - a. Sampling results
 - b. Assessment data report
3. Certificates
 - a. Qualifications of CP
 - b. Testing laboratory</SUB> qualifications
 - c. Third party consultant qualifications
 - d. Lead-Based Paint/Lead-Containing Paint Removal Plan including CP approval (signature, date, and certification number)
 - e. Rental equipment notification
 - f. Respiratory protection program
 - g. Hazard communication program
 - h. EPA approved hazardous waste treatment or disposal facility for lead disposal
 - i. Hazardous waste management plan
 - j. Vacuum filters
4. Manufacturer's Instructions
 - a. Chemicals and equipment
 - b. Materials
 - c. Safety data sheets for all chemicals
5. Closeout Submittals
 - a. Completed and signed hazardous waste manifest from treatment or disposal facility
 - b. Certification of medical examinations
 - c. Employee training certification

D. Qualifications Of CP

1. Submit name, address, and telephone number of the CP selected to perform responsibilities specified in paragraph entitled "Competent Person (CP) Responsibilities." Provide previous experience of the CP. Submit proper documentation that the CP is trained and licensed and certified in accordance with Federal, State, and local laws.

E. Third Party Consultant Qualifications

1. Submit the name, address, and telephone number of the third party consultant selected to perform the wipe sampling for determining concentrations of lead in dust or soil sampling. Submit proper documentation that the consultant is trained and certified as an inspector technician or inspector/risk assessor by the USEPA authorized State (or local) certification and accreditation program.

F. Testing Laboratory

1. Submit the name, address, and telephone number of the testing laboratory selected to perform the air and wipe and soil sampling, testing, and reporting of airborne concentrations of lead. Use a laboratory accredited under the EPA National Lead Laboratory Accreditation Program (NLLAP) by either the American Association for Laboratory Accreditation (A2LA) or the American Industrial Hygiene Association (AIHA) and that is successfully participating in the Environmental Lead Proficiency Analytical Testing (ELPAT) program to perform sample analysis.

G. Lead-Based Paint/Lead-Containing Paint Removal Plan (LBP/LCPRP)

1. Submit a detailed job-specific plan of the work procedures to be used in the removal of LBP/LCP. The plan shall include a sketch showing the location, size, and details of lead control areas, location and details of decontamination facilities, viewing ports, and mechanical ventilation system. Include in the plan, eating, drinking, smoking and sanitary procedures, interface of trades, sequencing of lead related work, collected waste water and paint debris disposal plan, air sampling plan, respirators, personal protective equipment, and a detailed description of the method of containment of the operation to ensure that airborne lead concentrations of 30 micrograms per cubic meter of air and baseline lead dust/soil concentrations are not reached or exceeded outside of the lead control area. Include site preparation and cleanup procedures. Include occupational and environmental sampling, training and strategy, sampling methodology, frequency, duration of sampling, and qualifications of sampling personnel in the air sampling portion of the plan.
- H. Occupational And Environmental Sampling Results
1. Submit occupational and environmental sampling results to the the Owner within three working days of collection, signed by the testing laboratory responsible official, the employee that performed the sampling, and the CP.
 - a. The sampling results shall represent each job classification, or if working conditions are similar to previous jobs by the same employer, provide previously collected exposure data that can be used to estimate worker exposures in accordance with 29 CFR 1926.62. The data shall represent the worker's regular daily exposure to lead.
 - b. Submit worker exposure data conducted during the task based trigger operations of 29 CFR 1926.62.
 - c. The initial monitoring shall determine the requirements for further monitoring and the need to fully implement the control and protective requirements including the compliance program (LBP/LCP) in accordance with 29 CFR 1926.62.
- I. Occupational And Environmental Assessment Data Report:
1. Some LBP/LCP removal work may not require full implementation of the requirements of 29 CFR 1926.62. Based on the experience of the Contractor and/or the use of a specific process or method for performing the work, the Contractor may be able to provide historic data (previous 12 months) to demonstrate that airborne exposures are controlled below the action level. Such methods or controls shall be fully presented in the LBP/LCPRP. To reduce the full implementation of 29 CFR 1926.62, the Contractor shall provide documentation in an Assessment Data Report.
 2. Submit occupational and environmental assessment report to the the Owner prior to start of work, signed by the testing laboratory responsible official, and the CP.
 - a. Submit a report that supports the determination regarding the reduction of the need to fully implement the requirements of 29 CFR 1926.62 and supporting the LBP/LCP. The exposure assessment shall represent each job classification, or if working conditions are similar to previous jobs by the same employer, provide previously collected exposure data that can be used to estimate worker exposures in accordance with 29 CFR 1926.62. The data shall represent the worker's regular daily exposure to lead for stated work.
 - b. Submit worker exposure data conducted during the task based trigger operations of 29 CFR 1926.62 with a complete process description in supporting a negative assessment.
 - c. The initial assessment shall determine the requirement for further monitoring and the need to fully implement the control and protective requirements including the compliance program (LBP/LCPRP) in accordance with 29 CFR 1926.62.
- J. Quality Assurance
1. Medical Examinations: Initial medical surveillance as required by 29 CFR 1926.62 shall be made available to all employees exposed to lead at any time (1 day) above the action level. Full medical surveillance shall be made available to all employees on an annual basis who are or may be exposed to lead in excess of the action level for more than 30 days a year or as required by 29 CFR 1926.62. Adequate records shall show that employees meet the medical surveillance requirements of 29 CFR 1926.33, 29 CFR 1926.62, and 29 CFR 1926.103.

02 - Existing Conditions

- a. Medical Records: Maintain complete and accurate medical records of employees for a period of at least 30 years or for the duration of employment plus 30 years, whichever is longer.
- b. Medical Surveillance: Provide medical surveillance to all personnel exposed to lead as indicated in 29 CFR 1926.62.
2. Competent Person (CP) Responsibilities
 - a. Certify training as meeting all federal, State, and local requirements.
 - b. Review and approve lead-based paint/lead-containing paint removal plan for conformance to the applicable referenced standards.
 - c. Continuously inspect lead-based paint removal work for conformance with the approved plan.
 - d. Perform air and wipe sampling.
 - e. Ensure work is performed in strict accordance with specifications at all times.
 - f. Control work to prevent hazardous exposure to human beings and to the environment at all times.
 - g. Certify the conditions of the work as called for elsewhere in this specification.
3. Training: Train each employee performing paint removal, disposal, and air sampling operations prior to the time of initial job assignment and annually thereafter, in accordance with 29 CFR 1926.21, 29 CFR 1926.62, and State and local regulations.
 - a. Training Certification: Submit a certificate for each employee, signed and dated by the approved training source, stating that the employee has received the required lead training.
4. Respiratory Protection Program
 - a. Furnish each employee required to wear a negative pressure respirator or other appropriate type with a respirator fit test at the time of initial fitting and at least annually thereafter as required by 29 CFR 1926.62.
 - b. Establish and implement a respiratory protection program as required by ANSI Z88.2, 29 CFR 1926.103, 29 CFR 1926.62, and 29 CFR 1926.55.
5. Hazard Communication Program: Establish and implement a Hazard Communication Program as required by 29 CFR 1926.59.
6. Hazardous Waste Management: The Hazardous Waste Management Plan shall comply with applicable requirements of federal, State, and local hazardous waste regulations and address:
 - a. Identification and classification of hazardous wastes associated with the work.
 - b. Estimated quantities of wastes to be generated and disposed of.
 - c. Names and qualifications of each contractor that will be transporting, storing, treating, and disposing of the wastes. Include the facility location and operator and a 24-hour point of contact. Furnish two copies of EPA, or State and local hazardous waste permit applications or permits or manifests, as required, and EPA Identification numbers.
 - d. Names and qualifications (experience and training) of personnel who will be working on-site with hazardous wastes.
 - e. List of waste handling equipment to be used in performing the work, to include cleaning, volume reduction, and transport equipment.
 - f. Spill prevention, containment, and cleanup contingency measures including a health and safety plan to be implemented in accordance with 29 CFR 1926.65.
 - g. Work plan and schedule for waste containment, removal and disposal. Wastes shall be cleaned up and containerized daily.
 - h. Unit cost for hazardous waste disposal according to this plan.
7. Environmental, Safety and Health Compliance: In addition to the detailed requirements of this specification, comply with laws, ordinances, rules, and regulations of Federal, State, and local authorities regarding removing, handling, storing, transporting, and disposing of lead waste materials. Comply with the applicable requirements of the current issue of 29 CFR 1926.62. Submit matters regarding interpretation of standards to the the Owner for resolution before starting work. Where specification requirements and the referenced documents vary, the most stringent requirement shall apply.

8. Pre-Construction Conference: Along with the CP, meet with the the Owner to discuss in detail the hazardous waste management plan and the lead-based paint/lead-containing paint removal plan, including work procedures and precautions for the removal plan.

K. Equipment

1. Respirators: Furnish appropriate respirators approved by the National Institute for Occupational Safety and Health (NIOSH), Department of Health and Human Services, for use in atmospheres containing lead dust. Respirators shall comply with the requirements of 29 CFR 1926.62.
2. Special Protective Clothing: Furnish personnel who will be exposed to lead-contaminated dust with proper disposable uncontaminated, reusable protective whole body clothing, head covering, gloves, and foot coverings as required by 29 CFR 1926.62. Furnish proper disposable plastic or rubber gloves to protect hands. Reduce the level of protection only after obtaining approval from the CP.
3. Rental Equipment Notification: If rental equipment is to be used during lead-based paint handling and disposal, notify the rental agency in writing concerning the intended use of the equipment. Furnish a copy of the written notification to the the Owner.
4. Vacuum Filters: UL 586 labeled HEPA filters.
5. Equipment for Owner's Personnel: Furnish the the Owner with two complete sets of personal protective equipment (PPE) daily, as required herein, for entry into and inspection of the paint removal work within the lead controlled area. Personal protective equipment shall include disposable whole body covering, including appropriate foot, head, and hand protection. PPE shall remain the property of the Contractor. Respiratory protection for the the Owner will be provided by the Owner.

L. Removal

1. Title to Materials: Materials resulting from demolition work, except as specified otherwise, shall become the property of the Contractor and shall be disposed of in accordance with Division 2 Section "Selective Structure Demolition" | Division 2 Section "Structure Demolition", except as specified herein.

1.2 PRODUCT

A. Chemicals

1. Submit applicable Safety Data Sheets for all chemicals used in paint removal work. Use the least toxic product approved by the the Owner.

B. Materials

1. The soluble metal content and the total metal content shall not exceed values which would cause a material to be classified as a hazardous waste.

1.3 EXECUTION

A. Protection

1. Notification: Notify the the Owner 20 days prior to the start of any paint removal work.
2. Lead Control Area Requirements
 - a. If LBP will be removed by means which will not likely create airborne, lead-containing dust (such as careful wet scraping or chemical stripping), establish a lead control area by situating critical barriers and physical boundaries around the area or structure where LBP/LCP removal operations will be performed.
 - b. If removal practice will create airborne, lead-containing dust (such as sanding, abrasive blasting, thermal cutting, demolition, or needle gun use), utilize full containment procedures - Contain removal operations by the use of critical barriers and HEPA filtered exhaust **OR** a negative pressure enclosure system with decontamination facilities and with HEPA filtered exhaust if required by the CP, **as directed**. For containment areas larger than **1,000**

- square feet (100 square meters) install a minimum of two 18 inch (450 mm) square viewing ports. Locate ports to provide a view of the required work from the exterior of the enclosed contaminated area. Glaze ports with laminated safety glass.
3. Protection of Existing Work to Remain: Perform paint removal work without damage or contamination of adjacent areas. Where existing work is damaged or contaminated, restore work to its original condition or better.
 4. Boundary Requirements: Provide physical boundaries around the lead control area by roping off the area designated in the work plan or providing curtains, portable partitions or other enclosures to ensure that airborne concentrations of lead will not reach 30 micrograms per cubic meter of air outside of the lead control area.
 - a. Physical Boundary: Provide physical boundaries around the lead control area by roping off the area designated in the work plan or providing curtains, portable partitions or other enclosures to ensure that airborne concentrations of lead will not reach 30 micrograms per cubic meter of air outside of the lead control area.
 - b. Warning Signs: Provide warning signs at approaches to lead control areas. Locate signs at such a distance that personnel may read the sign and take the necessary precautions before entering the area. Signs shall comply with the requirements of 29 CFR 1926.62.
 5. Furnishings:
 - a. The Owner will remove furniture and equipment from the building before lead-based paint removal work begins.
OR
Furniture and equipment will remain in the building. Protect and cover furnishings or remove furnishings from the work area and store in a location approved by the the Owner.
OR
Existing furniture and equipment is lead contaminated, decontaminate, dispose of as lead contaminated waste.
 6. Heating, Ventilating and Air Conditioning (HVAC) Systems: Shut down, lock out, and isolate HVAC systems that supply, exhaust, or pass through the lead control areas. Seal intake and exhaust vents in the lead control area with 6 mil (0.15 mm) plastic sheet and tape. Seal seams in HVAC components that pass through the lead control area. Provide temporary HVAC system for areas in which HVAC has been shut down outside the lead control area.
 7. Decontamination Shower Facility: Provide clean and contaminated change rooms and shower facilities in accordance with this specification and 29 CFR 1926.62.
 8. Eye Wash Station: Where eyes may be exposed to injurious corrosive materials, suitable facilities for quick drenching or flushing of the eyes shall be provided within the work area.
 9. Mechanical Ventilation System
 - a. Use adequate ventilation to control personnel exposure to lead in accordance with 29 CFR 1926.62.
 - b. To the extent feasible, use fixed local exhaust ventilation connected to HEPA filters or other collection systems, approved by the CP. Local exhaust ventilation systems shall be designed, constructed, installed, and maintained in accordance with ANSI Z9.2.
 - c. Vent local exhaust outside the building only and away from building ventilation intakes.
 - d. Use locally exhausted, power actuated, paint removal tools.
 10. Personnel Protection: Personnel shall wear and use protective clothing and equipment as specified herein. Eating, smoking, or drinking or application of cosmetics is not permitted in the lead control area. No one will be permitted in the lead control area unless they have been appropriately trained and provided with protective equipment.
- B. Work Procedures: Perform removal of lead-based paint in accordance with approved lead-based paint/lead-containing paint removal plan. Use procedures and equipment required to limit occupational and environmental exposure to lead when lead-based paint is removed in accordance with 29 CFR 1926.62, except as specified herein. Dispose of removed paint chips and associated waste in compliance with Environmental Protection Agency (EPA), federal, State, and local requirements.

1. Personnel Exiting Procedures: Whenever personnel exit the lead-controlled area, they shall perform the following procedures and shall not leave the work place wearing any clothing or equipment worn during the work day:
 - a. Vacuum themselves off.
 - b. Remove protective clothing in the contaminated change room, and place them in an approved impermeable disposal bag.
 - c. Shower **OR** Wash hands and face at the site, **as directed**, don appropriate disposable or uncontaminated reusable clothing; move to an appropriate facility; shower.
 - d. Change to clean clothes prior to leaving the physical boundary designated around the lead control area.
2. Air and Wipe Sampling
 - a. Air sample for lead in accordance with 29 CFR 1926.62 and as specified herein. Air and wipe sampling shall be directed or performed by the CP.
 - 1) The CP shall be on the job site directing the air and non-clearance wipe sampling and inspecting the lead-based paint removal work to ensure that the requirements of the contract have been satisfied during the entire lead-based paint removal operation.
 - 2) Collect personal air samples on employees who are anticipated to have the greatest risk of exposure as determined by the CP. In addition, collect air samples on at least 25 percent of the work crew or a minimum of two employees, whichever is greater, during each work shift.
 - 3) Submit results of air samples, signed by the CP, within 72 hours after the air samples are taken. Notify the the Owner immediately of exposure to lead at or in excess of the action level of 30 micrograms per cubic meter of air outside of the lead control area.
 - 4) For high profile, sensitive work such as present in family housing, child care facilities, administrative buildings, kitchens, barracks, etc., surface dust sampling to determine clearance (i.e., that the work has not contaminated surfaces within and adjacent to the control area) should be performed by a third party to reduce a conflict of interest. Samples must be conducted by an individual not paid or employed or otherwise compensated by the LBP/LCP removal Contractor. State or local regulations may require third party testing if the LBP/LCP removal operation is considered a lead hazard reduction activity.
 - 5) Before any work begins, collect and analyze baseline or soil wipe samples in accordance with methods defined in federal, State, and local standards inside and outside of the physical boundary to assess the degree of dust contamination in the facility prior to lead-based paint removal.
 - b. Air Sampling During Paint Removal Work: Conduct area air sampling daily, on each shift in which lead-based paint removal operations are performed, in areas immediately adjacent to the lead control area. Sufficient area monitoring shall be conducted to ensure unprotected personnel are not exposed at or above 30 micrograms per cubic meter of air. If 30 micrograms per cubic meter of air is reached or exceeded, stop work, correct the conditions(s) causing the increased levels. Notify the the Owner immediately. Determine if condition(s) require any further change in work methods. Removal work shall resume only after approval is given by the CP and the the Owner. For outdoor operations, at least one sample on each shift shall be taken on the downwind side of the lead control area.
3. Lead-Based Paint Removal
 - a. Manual or power sanding of interior and exterior surfaces is not permitted. Provide methodology for removing LBP in work plan. Remove paint within the areas designated on the drawings in order to completely expose the substrate. Take whatever precautions necessary to minimize damage to the underlying substrate.
 - b. Avoid flash rusting or deterioration of the substrate. Provide surface preparations for painting in accord with Division 7.
 - c. Provide methodology for removing LBP/LCP removal processes to minimize contamination of work areas outside the control area with lead-contaminated dust or other lead-contaminated debris/waste and to ensure that unprotected personnel are not exposed to

- hazardous concentrations of lead. Describe this LBP/LCP removal process in the LBP/LCPRP.
- d. Indoor Lead Paint Removal: Perform manual **OR** mechanical **OR** thermal **OR** chemical, **as directed**, paint removal in lead control areas using enclosures, barriers, or containments and powered locally exhausted paint removal tools. Collect residue and/or debris for disposal in accordance with federal, State, and local requirements.
 - e. Outdoor Lead Paint Removal: Perform outdoor removal as indicated in federal, State, and local regulations and in the LBP/CPRP. The worksite preparation (barriers or containments) shall be job dependent and presented in the LBP/LCPRP.
 - f. Sampling After Paint Removal: After the visual inspection, conduct soil sampling if bare soil is present during external removal operations and collect air samples inside and outside the lead control area to determine the airborne levels of lead inside and outside the work area. Collect wipe samples according to the HUD protocol contained in HUD Guidelines to determine the lead content of settled dust and dirt in micrograms per **square foot (square meter)** of surface area and parts per million (ppm) or micrograms per gram ($\mu\text{g/g}$) for soil.
4. Cleanup and Disposal
- a. Cleanup: Maintain surfaces of the lead control area free of accumulations of paint chips and dust. Restrict the spread of dust and debris; keep waste from being distributed over the work area. Do not dry sweep or use compressed air to clean up the area. At the end of each shift and when the paint removal operation has been completed, clean the area of visible lead paint contamination by vacuuming with a HEPA filtered vacuum cleaner, wet mopping the area and wet wiping the area as indicated by the CP. Reclean areas showing dust or residual paint chips or debris. After visible dust, chips and debris is removed, wet wipe and HEPA vacuum all surfaces in the work area. If adjacent areas become contaminated at any time during the work, clean, visually inspect, and then wipe sample all contaminated areas. The CP shall then certify in writing that the area has been cleaned of lead contamination before restarting work.
 - b. Clearance Certification
 - 1) The CP shall certify in writing that the final air samples collected inside and outside the lead control area are less than 30 micrograms per cubic meter of air; the respiratory protection used for the employees was adequate; the work procedures were performed in accordance with 29 CFR 1926.62 and 40 CFR 745; and that there were no visible accumulations of material and dust containing lead left in the work site. Do not remove the lead control area or roped off boundary and warning signs prior to the the Owner's acknowledgement of receipt of the CP certification.
 - 2) A third party consultant shall certify surface wipe sample results collected inside and outside the work area are less than 100 micrograms per **square foot (0.1 square meter)** on uncarpeted floors, less than 500 micrograms per **square foot (0.1 square meter)** on interior window sills and less than 800 micrograms per **square foot (0.1 square meter)** on window troughs **OR** not significantly greater than the initial surface loading determined prior to work, **as directed**.
 - 3) For exterior paint removal work, soil samples taken at the exterior of the work site shall be used to determine if soil lead levels had increased at a statistically significant level (significant at the 95 percent confidence limit) from the soil lead levels prior to the work. If soil lead levels do show a statistically significant increase above any applicable Federal or State standard for lead in soil, the soil shall be remediated back to the pre-work level.
 - c. Testing of Lead-Based Paint Residue and Used Abrasive: Test paint residue and used abrasive in accordance with 40 CFR 261 for hazardous waste.
 - d. Disposal
 - 1) Collect lead-contaminated waste, scrap, debris, bags, containers, equipment, and lead-contaminated clothing which may produce airborne concentrations of lead particles. Label the containers in accordance with 29 CFR 1926.62 and 40 CFR

261. Dispose of lead-contaminated waste material at an EPA or State approved hazardous waste treatment, storage, or disposal facility off Owner's property.
- 2) Store waste materials in U.S. Department of Transportation (49 CFR 178) approved 55 gallon (208 liter) drums. Properly label each drum to identify the type of waste (49 CFR 172) and the date the drum was filled. The the Owner or an authorized representative will assign an area for interim storage of waste-containing drums. Do not store hazardous waste drums in interim storage longer than 90 calendar days from the date affixed to each drum.
- 3) Handle, store, transport, and dispose lead or lead-contaminated waste in accordance with 40 CFR 260, 40 CFR 261, 40 CFR 262, 40 CFR 263, 40 CFR 264, and 40 CFR 265. Comply with land disposal restriction notification requirements as required by 40 CFR 268.
- 4) All material, whether hazardous or non-hazardous shall be disposed in accordance with laws and provisions and Federal, State, or local regulations. Ensure waste is properly characterized. The result of each waste characterization (TCLP for RCRA materials) will dictate disposal requirements.
5. Disposal Documentation: Submit written evidence that the hazardous waste treatment, storage, or disposal facility (TSD) is approved for lead disposal by the EPA and State or local regulatory agencies. Submit one copy of the completed manifest, signed and dated by the initial transporter in accordance with 40 CFR 262.
6. Payment for Hazardous Waste: Payment for disposal of hazardous waste will not be made until a signed copy of the manifest from the treatment or disposal facility certifying the amount of lead-containing materials delivered is returned and a copy is furnished to the Owner.

END OF SECTION 02 83 19 13a

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 83 19 13b - XRF TESTING FOR LEAD-BASED PAINT

1.1 DESCRIPTION OF WORK

- A. This specification covers the furnishing and installation of materials for XRF testing for lead-based paint. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

1.2 SUMMARY

- A. The Contractor shall perform work in accordance with the latest HUD Guidelines, in accordance with all applicable regulations of the Environmental Protection Agency (EPA), Occupational Safety & Health Agency (OSHA) and any applicable State or Local standards that may be more stringent than the Federal Standards except, as such guidelines are modified by the Owner in writing in this contract or any contract pursuant to this contract.
- B. Workmanship required in the execution of the work herein specified shall be of good quality and subject to the approval of the the Owner.

1.3 SUBMITTALS

- A. Notification Before Start of Work
 1. The Contractor shall send notices to the Project Superintendent, Residents, and the Department of Planning and Development 48 hours before the scheduled start of work. The Contractor shall make three (3) attempts to gain entry to each apartment, with proper 48 hour notification to the resident each time.
 2. The Contractor shall begin work no later than 48 hours after receiving a work proceed order.
- B. Copies of the submissions listed below must be tendered with the bid:
 1. Ability to perform XRF testing and paint chip sampling by submitting evidence of the successful completion of lead inspector training by all staff to be assigned to the job including inspector technicians. Training must be provided through a State approved EPA-Model program. All staff assigned to the Contract must also demonstrate training in the use of the XRF testing machines to be dedicated to this contract. The serial number of such XRF machine shall be provided to the the Owner.
 - a. Contractor or Subcontractor performing the work must have at least 3 years of satisfactory experience (documented) in performing XRF testing for a City, State or Federal Agency.
 2. Laboratory certification by the State Department of Health (or other responsible agency) and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP, and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided. Indicate if the laboratory is an independent entity from the Contractor.
 3. If a subcontractor will be used for any of the laboratory work of this contract, evidence of certification stated above must also be provided for the subcontractor.

- C. XRF Testing Report Format

02 - Existing Conditions

- a. All XRF report must be made after a formal submittal and approval by the Owner.
- b. A faxed summary report must be provided to the the Owner within 48 hours after completion of testing for a work Authorization. For XRF testing requiring confirmation by laboratory analysis of paint chip samples, the faxed summary report must be provided within 48 hours after the the Owner gives approval for testing of the collected paint chip samples.
- c. A detailed report must be provided to the the Owner within 5 business days after completion of the testing.

1.4 QUALITY ASSURANCE

- A. The work shall consist of furnishing all labor, material, insurance and all other incidental items required to do the following:
 1. XRF Testing
 - a. Random or comprehensive testing of various components in single family housing units, multi-family housing units, common areas and exterior sites, using any of the approved X-ray Fluorescence ("XRF") machines, to determine if the lead-based paint concentration is within permissible limits.
Note: Testing may be for entire apartments or selected rooms or components within the apartment.
 - b. The permissible limit shall be defined as a final reading showing a lead concentration of less than 1.0 mg/cm².
 - c. Refer to the Manufacturer's manual, as well as the "XRF Performance Characteristic Sheet" when determining calibration check tolerance, and other instrument specific information. Use the adjusted "XRF Performance Characteristic Sheets" in this contract when determining the inconclusive range.
 - d. In addition to the manufacturer's recommended warm up and quality control procedures, a set of three nominal XRF calibration check readings must be taken before the inspection begins and after the inspection has been completed in a particular unit, or every 4 hours, whichever occurs first. All reference material values and calibration check readings must be included in the report provided to the Owner.
 - e. Do not use the XRF to test highly curved or ornate surfaces, or surfaces inaccessible to the XRF, due to poor reliability of results. For such surfaces, laboratory analysis of paint chips must be done.
 - f. Only one XRF reading is required per testing combination. A unique testing combination is characterized by the room equivalent, the component, the substrate and the visible color of the paint. However, testing combinations with different colors on the same component and substrate may be combined into a single component type.
 - g. All inconclusive results must be treated according to the inspection rules using multi-family inspection or single family inspection rules as appropriate.
 - h. XRF field data sheets shall be filled out as they appear on completed Form 7.1("Single-Family Housing LBP Testing Data Sheet") and 7.5 ("Multifamily Housing LBP Testing Data Sheet") in HUD Guidelines.
 - i. Room equivalents or sections thereof that are not accessible for testing (i.e. locked bedrooms) shall be noted in the final report to the Owner.
 2. Laboratory testing of paint chips.
 - a. Collection of paint chips from various painted components for laboratory analysis due to XRF substrate corrected inconclusive and/or positive readings as directed by the the Owner.

- b. Laboratory preparation and testing by Flame Atomic Absorption Spectrometry (FAAS) or Graphite Furnace Atomic Absorption Spectrometry (GFAAS) to determine if the lead paint concentration is within permissible limits.
 - c. The permissible limit shall be defined as a lead concentration less than 0.5% by weight.
 - d. Collect paint chips in accordance with ASTM ES28-94.
 - e. Prepare paint chips in the laboratory for testing in accordance with ASTM ES37-94.
 - f. Repair and repaint areas from which paint chips have been collected, to match adjacent areas, unless notified by the the Owner in writing to utilize a temporary covering for the tested surfaces. The Contractor shall provide water based latex paint for this purpose. Colors shall be limited to white and off-white; and other colors if provided by the tenant.
 - g. Only one paint chip is required per testing combination. A unique testing combination is characterized by the room equivalent, the component, the substrate, and the visible color of the paint. However, testing combinations with different colors on the same component and substrate may be combined into a single component type.
 - h. Field data sheets and signed chain of custodies must be attached to the final report to the Owner.
- B. Occupied Residences
- 1. Some of the work of this contract will be in occupied apartments. The Contractor shall perform all of the work of this contract with the least inconvenience to the tenants.
 - 2. The Contractor shall take all necessary precautions to protect the property of the the Owner, its residents and the public. The contractor must repair any damaged property, whether of the the Owner, its residents, or the public, and restore such property to its original condition. If the damage is beyond repair, the Contractor shall replace it with new, that in the judgement of the the Owner, match the existing materials and are of equal quality and workmanship. All such repairs shall be at the Contractor's expense.
- C. Applicable Regulations
- 1. ASTM Standards
 - a. ASTM E 1583 on evaluating laboratories used to determine lead levels;
 - b. ASTM E 1605 on terminology;
 - c. ASTM E 1613 on determining lead by atomic emission or atomic absorption spectroscopy;
 - d. ASTM E 1645 on laboratory preparation of paint-chip samples;
 - e. ASTM E 1775 on-site extraction and field portable stripping voltammetry analysis for lead;
 - f. ASTM PS 53 on identifying and managing lead in facilities;
 - g. ASTM PS 87 on ultrasonic extraction for later analysis for lead;
 - h. ASTM PS 88 on determining lead by portable electro analysis
 - 2. OSHA Standards (without limitation), include:
 - a. 29 CFR 1926.20 - General safety and health provisions;
 - b. 29 CFR 1926.21 - Safety training and education;
 - c. 29 CFR 1925.25 - Housekeeping;
 - d. 29 CFR 1926.28 - Personal protective equipment;
 - e. 29 CFR 1926.51(f) - Washing facilities;
 - f. 29 CFR 1926.55 - Gases, vapors, fumes, dusts, and mists;
 - g. 29 CFR 1926.57 - Ventilations;
 - h. 29 CFR 1926.59 - Hazardous Communication Standards;
 - i. 29 CFR 1926.10 - Respiratory protection; and
 - j. 29 CFR 1926.62 - Lead in Construction
 - 3. The Contractor must comply with all applicable requirements of the Resource Conservation & Recovery Act (RCRA) of 1976 as amended in 1980 and 1984 by the Hazardous & Solid Waste Amendments (HSWA).

02 - Existing Conditions

4. The Contractor must follow the XRF Performance Characteristic Sheet (PCS) for all inspection activities. XRF PCSs are available from the National Lead Information Center Clearinghouse or through the HUD website at <http://www.hud.gov/offices/lead/lbp/hudguidelines/allpcs.pdf>.

1.5 PRODUCTS

- A. XRF Instruments and Testing Protocols
 1. The Contractor shall use XRF instruments that are approved by the Owner.
 2. XRFs must be used in accordance with the manufacturer's instructions and the XRF Performance Characteristic Sheet. If discrepancies exist between the XRF Performance Characteristic Sheet, the HUD Guidelines and the manufacturer's instructions, the most stringent guidelines should be followed.

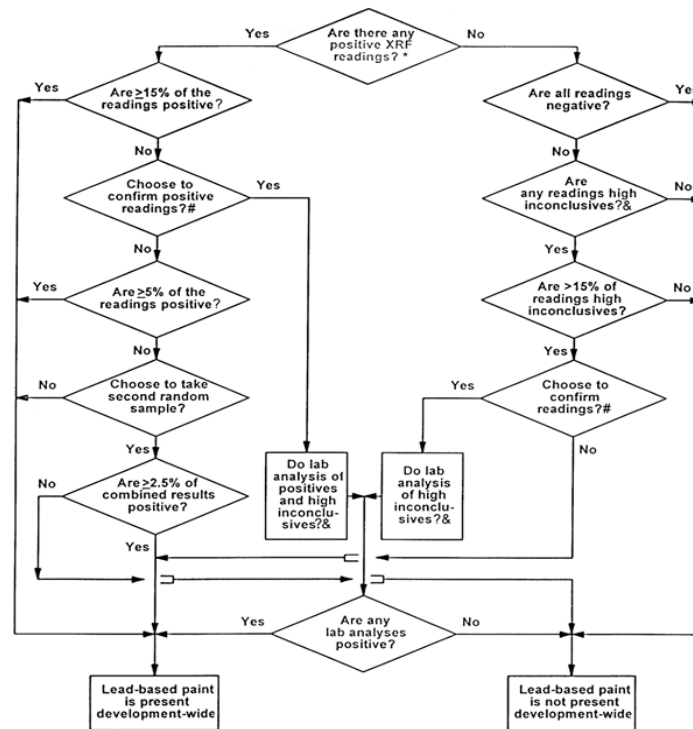

1.6 EXECUTION

- A. Inspection and Testing
 1. **Single Family Testing Rules**
 - a. If the housing development has less
 - 1) than 10 units built between 1960-1970 or
 - 2) 20 units built before 1960 or
 - 3) the random testing rules in a multi-family development are not being used then single family testing rules must be followed.
 - b. List all testing combinations (see HUD Guidelines Table for an example) in all interior rooms, on all exterior building surfaces, and on surfaces in other exterior areas, such as fences, playground equipment, and garages. The "SingleFamily Housing LBP Testing Data Sheet" (see HUD Guidelines) or a comparable data collection instrument may be used for this purpose.
 - 1) Test all room equivalents inside and outside the dwelling unit. The final report must include a final determination of the presence or absence of lead-based paint on each testing combination in each room equivalent.
 - 2) Inspect each testing combination in each room equivalent, unless similar building component types with identical substrates (such as windows) are all found to contain lead-based paint in the first five interior room equivalents. In that case, testing of that component type in the remaining room equivalents may be discontinued, if and only if the Owner agrees beforehand to such a discontinuation. The inspector should then conclude that similar building component types in the rest of the dwelling unit also contain lead-based paint.
 - 3) Painted furniture that is physically attached to the unit (for example, a desk or dresser that is built-in) should be included in the inspection as a testing combination.
 - 4) Results of an inspection may be summarized by classifying component types across room equivalents if patterns or trends are supported by the data.
 - 5) All substrates across all room equivalents should be grouped into one of the six substrate categories (brick, concrete, drywall, metal, plaster, or wood).
 - c. Number and Location of XRF Readings
 - 1) XRF testing is required for at least one location per layers of paint should be included and the XRF probe testing combination, except for interior and exterior faceplate should be able to lie flat against the surface walls, where four readings should be taken, one on of the test location each wall.
 - 2) For interior and exterior walls: take at least four readings (one of ea. wall). If there are more than four walls test the four largest walls, calculate the average of the

- readings, round the result to same number of decimal places as the XRF instrument displays, and classify the remaining walls with the same painting history as the tested walls, based on this rounded average. When the remaining walls in a room equivalent clearly do not have the same painting history as that of the tested walls, test and classify the remaining walls individually.
- 3) Select areas of paint which are most likely to have old paint or coatings, where areas of paint appear thickest. Avoid testing where paint has worn away, chipped; or over pipes, electrical surfaces, nails, and any other possible interferences.
 - 4) A numbering system, floor plan, sketch or other system may be used to document which testing combinations were tested and sufficiently detailed enough for another individual to find them.
 - a) Side identification Identify perimeter wall sides with letters A, B, C, and D (or numbers or Roman numerals). Side A for single-family housing is the street side for the address. Side A in multi-family housing is the apartment entry door side. Side B, C, and D are identified clockwise from Side A as one faces the dwelling; thus Wall B is to the left, Wall C is across from Side A, and Side D is to the right of Side A. Each room equivalent's side identification follows the scheme for the whole housing unit. Because a room can have two or more entries, sides should not be allocated based on the entry point. For example, giving a closet a side allocation based on how the room is entered would make it difficult for another person to make an easy identification, especially if the room had two closets and two entryways.
 - b) Room Equivalent Identification Room equivalents should be identified by both a number and a use pattern (for example, Room 5-Kitchen). Room 1 can always be the first room, at the A-D junction at the entryway, or it can be the exterior. Rooms are consecutively numbered clockwise. If multiple closets exist, they are given the side allocation: for example, Room 3, Side C Closet. The exterior is always assigned a separate room equivalent identifier.
 - c) Sides in a Room Sides in an interior room equivalent follow the overall housing unit side allocation. Therefore, when standing in any four-sided room facing Side C, the room's Side A will always be to the rear, Side B will be to the left, and Side D will be to the right.
 - d) Building Component Identification Individual building components are first identified by their room number and side allocation (for example, the radiator in Room 1, Side B is easily identified). If multiple similar component types are in a room (for example, three windows), they are differentiated from each other by side allocation. If multiple components are on the same wall side, they are differentiated by being numbered left to right when facing the components. For example, three windows on Wall D are identified as windows D1, D2, and D3, left to right. If window D3 has the only old original sash, it is considered a separate testing combination from the other two windows. Codes or abbreviations for building components and/or locations may be used in order to shorten the time needed for data entry. If codes or abbreviations are used, the inspection records and the inspection report must include a table showing their meaning.
 - d. XRF Instrument Reading Time
 - 1) The recommended time to open an XRF instrument's shutter to obtain a single XRF result for a testing location depends on the specific XRF instrument model and the mode in which the instrument is operating. Follow manufacturer's instructions per HUD Guidelines.
 - e. XRF Calibration Check Readings
 - 1) Follow manufacturer's instructions per HUD Guidelines.

- f. Substrate Correction
 - 1) The XRF measurements, corrected for substrate contribution, if required by the Performance Characteristic Sheet ("PCS") for the particular type of instrument being used, should be sorted by the inspector by component type into the following categories:
 - a) Positive- A positive XRF reading in accordance with the XRF's Performance Characteristic Sheet.
 - b) Negative- A negative XRF reading in accordance with the XRF's Performance Characteristic Sheet.
 - c) High Inconclusive- An inconclusive XRF reading equal to or greater than the midpoint of the XRF's inconclusive range, in accordance with the XRF's Performance Characteristic Sheet.

- g. The following Decision analyses will be used to determine which components are positive, negative or inconclusive:

* "Positive," "negative," and "inconclusive" XRF readings are determined in accordance with the XRF instrument's Performance Characteristics Sheet as described in the HUD Guidelines for the Evaluation and Control of Lead Hazards in Housing, chapter 7.
 & A high inconclusive reading is an XRF reading at or above the midpoint of the inconclusive range. For example, if the inconclusive range is 0.41 to 1.39, its midpoint (average) is 0.90; a reading in the range from 0.90 to 1.39 would be a high inconclusive reading.
 # Any point or coating may be assumed to be lead-based paint, even without XRF or laboratory analysis. Similarly, any XRF reading may be confirmed by laboratory analysis.

- 1)
- 2) All inconclusive results must be confirmed with laboratory analysis, or as an alternative must be classified as positive. the Owner may also wish to confirm positive XRF results with laboratory analysis. Therefore the Contractor must make a field determination of which XRF readings falls in the inconclusive or positive ranges and take paint chip samples during the XRF testing for possible laboratory analysis. If the majority of XRF readings are positive in the first few units, the inspector must consult with the Owner on whether to continue taking paint chip samples. Only the Owner may determine whether to submit collected paint chip samples for laboratory analysis or to classify the element as positive.

2. Multi-family Housing Testing Rules (Random Sampling)

- a. In order to use the Multi-family housing testing rules, there must multi-family housing is defined as any group of more than four units that are similar in construction from unit to unit
- b. Determine the number of randomly selected units to be tested in accordance with Table 7.3, below. Chapter 7 of the HUD Guidelines also describes how to select the units randomly. If a unit or units which were selected as part of the original random sample cannot be entered for a particular reason, a replacement unit(s) must be randomly selected in accordance with the HUD Guidelines.

Table 7.3 Number of Units to be Tested in Multi-family Building or Developments*

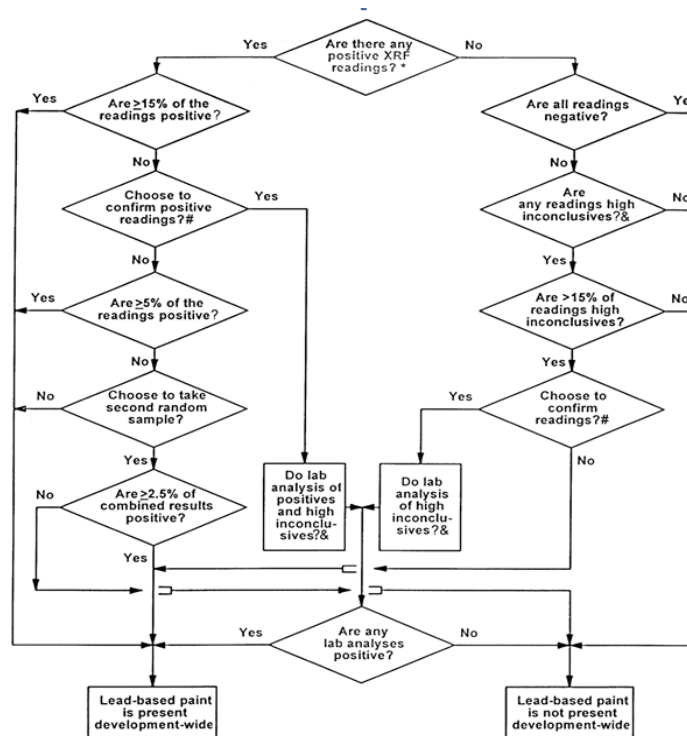

Number of Similar Units, Similar Common Areas, or Similar Exterior Sites	Pre-1960 or Unknown-Age Building or Development: Number of Units to Test *	1960-1977 Building or Development: Number of Units to Test *
1-10	All	All
11-13	All	10
14	All	11
15	All	12

3000	174	87
3500	203	102
4000	232	116

* For brevity, "Number of Units" and "Number of Units to Test" are used, but the number to test is the same for similar units, similar common areas, and similar exterior sites.

- c. An assessment on each tested component must note four attributes, also called a testing combination.
 - 1) The room equivalent (where the testing took place i.e. bedroom, bathroom, etc.)
 - 2) The component type (door, wall #1 - upper left, etc.)
 - 3) The substrate (brick, wood, concrete, drywall, plaster or metal).
 - 4) The color of the paint.
- d. These attributes must be included as part of the report.
- e. For each testing combination, the condition of the painted surfaces should be noted as either intact, fair or poor.
- f. One reading with the X-ray fluorescence (XRF) instrument on each testing combination is all that is required.
- g. At least 40 components of a given type must be tested to obtain the desired level of confidence in the results throughout the multi-family development. If less than 40 components of a given type exist in the buildings to be tested i.e. they are unique components, then the measurement should be taken using single family testing rules (described below). If less than 40 components of a given type exist in the units to be tested, additional components of this type can be identified in other units in the complex and tested to bring the total up to 40 so that multi-family testing rules can be used. The decision of which option the Contractor should use will be made by the the Owner.
- h. To increase the number of tested components of a given type, testing combinations with different colors on the same component and substrate may be combined into a single component type. For example, if "wood doors" is the component type, all wood doors tested for lead-based paint could belong to the same component type, regardless of color.
- i. A component type may be differentiated by color as long as there are 40 tested and there is a good reason for differentiation.
- j. The XRF measurements, corrected for substrate contribution, if required by the Performance Characteristic Sheet ("PCS") for the particular type of instrument being used, should be sorted by the inspector by component type into the following categories:
 - 1) Positive- A positive XRF reading in accordance with the XRF's Performance Characteristic Sheet.
 - 2) Negative- A negative XRF reading in accordance with the XRF's Performance Characteristic Sheet.
 - 3) High Inconclusive- An inconclusive XRF reading equal to or greater than the midpoint of the XRF's inconclusive range, in accordance with the XRF's Performance Characteristic Sheet.

- k. The following Decision analyses will be used to determine which components are positive, negative or inconclusive:

* "Positive," "negative," and "inconclusive" XRF readings are determined in accordance with the XRF instrument's Performance Characteristics Sheet as described in the HUD Guidelines for the Evaluation and Control of Lead Hazards in Housing, chapter 7.
 & A high inconclusive reading is an XRF reading at or above the midpoint of the inconclusive range. For example, if the inconclusive range is 0.41 to 1.39, its midpoint (average) is 0.90; a reading in the range from 0.90 to 1.39 would be a high inconclusive reading.
 # Any paint or coating may be assumed to be lead-based paint, even without XRF or laboratory analysis. Similarly, any XRF reading may be confirmed by laboratory analysis.

- l. If there are readings on a component type(s) equal to or greater than 1.0 mg/cm² and paint chip samples are submitted to the laboratory, there are two possible results:
- 1) If all lab samples on a component type are below 0.5% lead by weight, the component type can be classified as negative throughout the development.
 - 2) If one or more lab results are positive, (equal to or greater than 0.5% lead by weight for a component) the the Owner will take one of three options:
 - a) Treat the component type as positive throughout the development, or
 - b) Test the component type throughout the development, or
 - c) If 5% or less of the component type are positive, take a second random sample, just testing that component type.
 - 3) If option 2)c) above is selected by the Owner and the combined results of the first and second random sample are less than 2½% positive, the following additional options are available depending on the results.
 - a) If no positives are found in the second sample, no further testing is necessary. Those positives in the first random sample will be monitored/abated (not by this Agreement), but the rest of the component type can be classified as negative.

- b) If positives are found on a component type in the second sample, the the Owner has the option to classify the component type as positive throughout the development or comprehensively test it.
 - c) If the combined results of the two random samples are equal to or greater than 2½%, the the Owner also has the option to comprehensively test the remaining components of that type or classify them as positive.
 - m. Paint Chip Sample Size: The Paint chip samples should be taken from a 4 square inch (25 square centimeter) area that is representative of the paint on the testing combination, as close as possible to any XRF reading locations and, if possible, unobtrusive. This area may be a 2" x 2" (5 x 5 centimeters) square, or a 1" x 4" (2.5 x 10 centimeters) rectangle, or have any other dimensions that equal at least 4 square inches (25 square centimeters). Regardless of shape, the dimensions of the surface area must be accurately measured (to the nearest millimeter or 1/16th of an inch) so that the laboratory results can be reported in mg/cm². Results should be reported as percent by weight if the surface area cannot be measured accurately or if all paint within the sampled area cannot be removed. In these cases, lead should be reported in ppm or percent weight, not in mg/cm². Smaller surface area can be used if acceptable to the laboratory. (See ASTM E 1729). In all cases those who take the samples should consult with the NLLAP recognized laboratory selected regarding the requirements for the submission samples for lead-based paint analysis.
 - n. If the the Owner decides to test in search of these hard-to-find components coated with lead based paint, the inspector must use the single family testing rules described in the previous section.
- 3. Common Areas and Exterior Sites Testing Rules**
- a. Similar common areas and similar exterior sites must always be tested, but in some cases they can be sampled in much the same way that dwelling units are. Common areas and building exteriors typically have a similar painting history from one building to the next. In multifamily housing, each common area (such as building lobby, laundry room, or hallway) can be treated as a dwelling unit. If there are multiple similar common areas, they may be grouped for sampling purposes I exactly the same way as regular dwelling units. However, dwelling units, common areas and exterior sites cannot be all mixed together in a single group. All testing combinations within each common area or building exteriors selected for testing must be inspected. This includes playground equipment, benches and miscellaneous testing combinations located throughout the development. The specific common areas and building exteriors to test should be randomly selected, in much the same way as specific units are selected using random numbers. The number of common areas to be tested should be taken from table 7.3 (HUD Guidelines). In this instance, common areas and building exteriors can be treated in the same way as housing units (although they are not to be confused with true housing units).
- 4. Unit and Common Area Drawings**
- a. Mark-ups of as built drawings depicting room equivalents that are tested must be provided as part of the report.
 - b. The Contractor should test in a clockwise path starting from the door through the space and room equivalents so that the approximate location of each component tested can be easily established by referencing the room equivalent and sides.
 - c. Each space must have a reference point (side A, B, C, D or wall 1, 2, 3 or 4). The wall with the door should always be referenced as wall 1 or side A. If there is more than one door, wall 1 or side A should be used to refer to the wall with the door through which the room is first entered when moving in a clockwise fashion through the unit.

B. Evaluation of the Inspection by the the Owner

1. The Contractor will be required to carry out retesting at no additional cost to the the Owner, after completion of the Inspection at each the Owner's development as described in the HUD Guidelines, for single family housing, multi-family housing and common areas. The the Owner shall randomly select the testing combinations to be retested and the Contractor shall perform the retesting using the same XRF instrument(s) which was/were used to take the original readings. An the Owner's inspector shall be present to observe all retesting. The retesting shall be limited to ten (10) testing combinations, and if necessary to repeat the retest, the testing combinations randomly selected for repeating the retest shall also be limited to ten.
 2. If the retest tolerance limit computed from the information provided in the "XRF Performance Characteristics Sheet" (see HUD Guidelines) is exceeded, the retest will be repeated as described in the HUD Guidelines for single family, multi-family housing and common areas. If the retest tolerance limit is exceeded again, the the Owner may require the Contractor to retest the entire development at no additional cost to the the Owner, or the the Owner may withhold all payments and terminate its agreement with the Contractor.
- C. Option to do Laboratory Testing only
1. The the Owner may, for a specific testing assignment, request in writing that the Contractor, when utilizing the multi-family housing testing rules for random sampling, or the single family housing testing rules, do all testing through laboratory analysis of paint chips rather than through XRF Spectrum Analyzer testing with laboratory confirmation as needed. Please note that under the single family housing testing rules, only one paint chip must be taken and analyzed for each component type.
- D. Waste Disposal
1. All waste generated must be legally disposed in accordance with Federal, State and Local regulations.

END OF SECTION 02 83 19 13b

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 83 19 13c - LEAD DUST WIPE, AIR AND TCLP SAMPLING AND ANALYSIS

DESCRIPTION OF WORK

This specification covers the furnishing and installation of materials for lead dust wipe, air and TCLP sampling and analysis. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

GENERAL

Definitions: Unless otherwise specified the following definitions shall apply:

1. **"Approved"**: shall mean approved by all public agencies having jurisdiction, and the Owner.
2. **"The Owner"**: shall mean the Owner and its designated authorized representatives.
3. **"Contractor"**: shall mean the firm that is awarded this contract and is responsible to ensure compliance with Federal, State and City regulations as well as these Contract documents.
4. **"Development or Project"**: a group of buildings in one or more designated geographical locations, owned or operated by the Owner and referred to by a common name by the Owner.
5. **"Dust Cleaning Firm"**: shall mean the contractor under a separate contract or the Owner responsible for cleaning of lead dust, as directed by the Owner, until the clearance levels are achieved, as defined in the "Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing, June 1995" or latest edition published by the United States Department of Housing and Urban Development (HUD).
6. **"Equal or Approved Equal"**: shall mean equal in the opinion of the Owner.
7. **"HUD"**: the United States Department of Housing and Urban Development.
8. **"HUD Guidelines"**: shall mean Guidelines for the Evaluation and Control of Lead-Based Paint Hazards in Housing issued by HUD'S Office of Lead-Based Paint Abatement and Poisoning Prevention in June 1995 except as such guidelines are later modified by HUD and/or modified by the Owner in writing pursuant to this contract.
9. **"Inspector"**: an individual who has completed training from an accredited program and been licensed or certified by the appropriate State or local agency to (1) perform inspections to determine and report the presence of lead-based paint on a surface-by-surface basis through on-site testing, (2) report the findings of such an inspection, (3) collect environmental samples for laboratory analysis, (4) perform clearance testing, and (5) document successful compliance with lead-based paint hazard control requirements or standards.
10. **"Lead-Based Paint"**: any paint, varnish, shellac, or other coating that contains lead equal to or greater than 1.0 mg/cm² as measured by XRF or laboratory analysis, or 0.5 percent by weight (5,000 µg/g, 5,000 PPM, or 5,000 mg/kg) as measured by laboratory analysis.
11. **"Lead-Based Paint Hazard"**: a condition in which exposure to lead from lead-contaminated dust, lead-contaminated soil or deteriorated lead-based paint would have an adverse effect on human health (as established by the EPA Administrator under Title IV of the Toxic Substance Control Act). Lead-based paint hazards include for example, deteriorated lead-based paint, leaded dust levels above applicable standards and bare leaded soil above applicable standards.
12. **"Lead-Based Paint Hazard Control"**: activities to control or eliminate lead-based paint hazards, including interim controls and complete abatement.
13. **"Lead-Contaminated Dust"**: surface dust in residences that contain an area or mass concentration of lead in excess of the standard established by the EPA Administrator, pursuant to Title IV of the Toxic Substance Control Act. Until the EPA standards are set, the HUD recommended clearance and risk assessment standards for leaded dust are 40 µg/ft² on floors, 250 µg/ft² on interior window sills, and 800 µg/ft² on window troughs.
14. **"Monitoring"**: shall refer to inspection to ensure compliance with all Federal, State and City Standards or guidelines, and contractual specifications.
15. **"Provide"**: shall mean furnish and install.

- 16. **"Risk Assessor"**: a certified individual who has completed training with an accredited training program and who has been certified to (1) perform risk assessments, (2) identify acceptable abatement and interim control strategies for reducing identified lead-based paint hazards, (3) perform clearance testing and reevaluations, and (4) document the successful completion of lead-based paint hazard control activities.

Applicable Regulations/References

- 17. The work conducted shall comply with all applicable Federal, State and City regulations. Applicable guidelines and standards listed in the scope of work include, but are not limited to:

<ul style="list-style-type: none"> 24 CFR Parts 35,36,37 Guidelines for the Evaluation and Control of Lead-Based Paint in Housing (HUD Guidelines June 1995) & 1997 Revisions 29 CFR 1910 29 CFR 1910.1025 29 CFR 1910.134 29 CFR 1910.1200 29 CFR 1910.245 29 CFR 1926 29 CFR 1926.20 29 CFR 1926.21 29 CFR 1926.25 29 CFR 1926.28 29 CFR 1926.51 29 CFR 1926.55 29 CFR 1926.59 29 CFR 1926.62 29 CFR 1926.103 40 CFR 61 Subpart A 40 CFR 241 40 CFR 257 40 CFR 261/262 American National Standards Institute (ANSI) Z87.1 ANSI Z88.2-80 American Society For Testing Materials (ASTM) 	<ul style="list-style-type: none"> HUD Lead-Based Paint Regulations General Industry Standard Lead Standard for General Industry Respiratory Protection Hazard Communication Specification for Accident Prevention Construction Industry Standards General Safety & Health Provisions Safety Training & Education Housekeeping Personal Protective Equipment Washing Facilities Gases, Vapors, Fumes, Dusts & Mists Hazard Communication Standard Construction Industry Lead Standard Respiratory Protection General Provisions Guidelines for the Land Disposal of Solid Waste Criteria for the Land Disposal of Solid Waste Waste Disposal Facilities & Practices Eye Protection Practices for Respiratory Protection All Applicable Standards
---	---
- 18. The contractor shall ensure that any programs, certifications, licenses or other documentation in accordance with the above and/or any other applicable Federal, State, and Local Regulations/Guidelines are provided.

Scope Of Work

- 19. The work shall consist of furnishing labor, materials, insurance and all other incidental items required to perform the following:
 - a. Dust wipe sampling and analysis
 - 1) Collect dust wipe samples from various horizontal surfaces, such as floors, window sills, window troughs, etc., as directed by the Owner.
 - 2) Dust wipe samples shall be collected in accordance with ASTM ES30-94.
 - 3) Analyze dust wipe sample in the laboratory using Flame Atomic Absorption Spectrometry ("FAAS") or Graphite Furnace Atomic Absorption Spectrometry("GFAAS").
 - 4) Provide result of analysis in micrograms per square foot.

- 5) A faxed summary of results must be provided to the Owner within 24 hours after the Owner authorizes the Contractor to perform the laboratory analysis of the collected dust wipe sample. Contractor shall also have the ability to provide results in 4 hours for clearance, following lead-based paint abatement work, if requested by the Owner. The sampling result must be provided in a form approved by the Owner and must include for each dust wipe sample, the Project, the building address, the sample number, the room or room equivalent, the surface type, dimensions of sample areas, total micrograms, micrograms per square feet, and an indication of pass or fail.
 - 6) Turn-around time for results shall be counted from the time the Contractor performs collection of dust wipe samples to the time the results are actually presented to the Owner. This includes travel time from the site to the laboratory of the Contractor and back to the site.
 - 7) A detailed final report covering the results of all dust wipe samples taken and analyzed must be submitted within 5 days from the time the Owner authorizes the performance of the laboratory analysis. The sampling report must include for each dust wipe sample, the Project, the building address, the sample number, the room or room equivalent, the surface type, dimensions of sample areas, total micrograms, micrograms per square feet, and indicate pass or fail in a form approved by the Owner. Also include in the report the method of analysis, i.e. "FAAS" or "GFAAS", and the detection limits. The laboratory test results in the final report must be signed by the Laboratory Director.
 - 8) The sampling data report must contain all required data fields as specified by the Owner. The sampling data report shall be provided to the Owner on 3.5 inch high density diskettes in ASCII file form. The required data fields will be provided by the Owner to the Contractor.
 - 9) The laboratory used for the analysis of the dust wipe samples must be certified by the State Department of Health (or other responsible agency) and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP, and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided. Indicate if the laboratory is an independent entity from the Contractor.
- b. Dust Spiked Samples
- 1) Provide dust spiked samples to the Owner. Dust spiked samples shall be prepared in accordance with the HUD Guidelines.
NOTE: These samples are separate from the ones required by the Contractor for its own QA/QC
 - 2) Prepare dust spiked samples in a manner such that they are indistinguishable from the field samples.
 - 3) Prepare dust spiked samples using the same lot as that to be used in the field.
 - 4) Dust spiked samples shall be inserted into the sample stream, randomly, by the Owner Inspector.
 - 5) Blind analysis of dust spiked samples must fall within 80%-120% of the true value. If the laboratory fails to obtain readings within these limits, two more spiked samples shall be sent immediately to the lab for analysis.
 - 6) If the two additional spiked samples fail, the sample batch shall be considered invalid, and the Owner may, at its sole discretion, terminate this contract as well as withhold payment for services already rendered.
- c. Air Sampling and Analysis
- 1) Collect area air samples at various locations and various projects for personal exposure assessment as directed by the Owner.
 - 2) Air samples shall be collected in accordance with ASTM E1553-93.
 - 3) Prepare air samples for analysis in accordance with ASTM E33-94
 - 4) Analyze air samples using FAAS or GFAAS.

- 5) All equipment required for personal air sampling, including pumps shall be provided by the Contractor at no extra cost to the Owner.
 - 6) Provide results of air samples in micrograms per cubic meter.
 - 7) A faxed summary of result must be provided to the Owner within 24 hours after the Owner authorizes the Contractor to perform the laboratory analysis of the collected air sample. The sampling result must include for each air sample taken the Project, the building address, the sample number, the room or room equivalent, and the reading.
 - 8) Turn-around time shall start after collection of the air samples, and includes travel time to and from the laboratory.
 - 9) A detailed final report covering the results of all air samples taken and analyzed must be submitted within 5 days from the time the Owner authorizes the performance of the laboratory analysis. The sampling report must include for each air sample, the Project, the building address, the sample number, the room or room equivalent, and the reading. The laboratory report contained in the final report must be signed by the Laboratory Director.
 - 10) The sampling data report must contain all required data fields as specified by the Owner. The sampling data report shall be provided to the Owner on 3.5 inch high density diskettes in ASCII file form. The required data fields will be provided by the Owner to the Contractor.
 - 11) The laboratory used for the analysis of the dust wipe samples must be certified by the State Department of Health (or other responsible agency) and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP, and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided. Indicate if the laboratory is an independent entity from the Contractor.
 - 12) Air sampling technician shall be present during the entire shift of the air sampling.
- d. TCLP Sampling and Analysis
- 1) Take core samples of construction waste as directed by the Owner and analyze by TCLP testing to determine if waste is hazardous.
 - 2) Waste shall be classified as hazardous if the concentration of lead is greater than 5 parts per million by TCLP testing.
 - 3) The laboratory used for the analysis of the TCLP samples must be certified by the State Department of Health (or other responsible agency) and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP, and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided. Indicate if the laboratory is an independent entity from the Contractor.
 - 4) A faxed summary of result must be provided to the Owner within 48 hours after the Owner authorizes the Contractor to perform the TCLP analysis of the waste. Provide results in parts per million (ppm).
 - 5) Final results provided to the Owner by the Contractor must include written sample preparation procedure and laboratory specific written procedures for performing TCLP, including quality control procedures used for performing the TCLP, and a table listing the sample numbers, description of the construction waste, and the result of the TCLP. The laboratory report contained in the final report must be signed by the Laboratory Director.
 - 6) Final report must also specify detection limits.
 - 7) Final report must be provided within 5 days from the time the authorization to perform the TCLP is given by the Owner.

General Provisions

20. Some of the work of this contract may be in occupied apartments. The Contractor shall perform all of the work of this contract with the least inconvenience to the tenants.
21. The Contractor shall take all necessary precautions to protect the property of the Owner, its residents, and the public. The Contractor must repair any damaged property, whether of the Owner, its residents, or the public, and restore such property to its original condition. If the damage is beyond repair, the Contractor shall replace it with new, that in the judgment of the Owner, match the existing materials and/or of equal quality and workmanship. All such repairs shall be at the Contractor's expense.
22. The Contractor shall develop a work plan to be performed as requested by the Department of Planning and Development. The detailed plan shall include coordination of the monitoring and sampling work with the Contractor in a manner that will be least disruptive to the normal use of the non-work areas in the building. The plan should also include emergency procedures in case of fire.
23. The Contractor shall perform work in accordance with the latest HUD Guidelines, except as such Guidelines are modified by the Owner in writing in this Contract, or any Contract pursuant to this Contract, and in accordance with all applicable Federal, State and Local regulations.
24. The Contractor shall include in the bid price all supplementary miscellaneous items not specified but implied or required in order to complete the work.

Submissions

25. Six (6) copies of the submissions listed below must be submitted to the Owner by the Contractor or Subcontractor performing the Work:
 - a. Ability to perform lead dust wipe sampling by submitting evidence of the successful completion of lead inspector and/or risk assessor training by all staff to be assigned to the job including inspector technicians. As stated previously, training must be provided through an approved program.
 - b. Laboratory certification by the State Department of Health (or other responsible agency) through its ELAP program and by the USEPA through the EPA's National Lead Laboratory Accreditation Program ("NLLAP"), or as an alternative having accreditation application pending before NLLAP and having acceptable performance on five consecutive rounds of the EPA, Environmental Laboratory Proficiency Analytical Testing (ELPAT) program, including the most recent round; evidence of such accreditation must be provided.
 - c. If a subcontractor will be used for any of the laboratory work of this contract, evidence of certification stated in (2) above must also be provided for the subcontractor.

Waste Disposal

26. All waste generated must be legally disposed in accordance with the Federal, State and Local Regulations.

SECTION 02 84 16 00 - HANDLING OF LIGHTING BALLASTS AND LAMPS CONTAINING PCBS AND MERCURY

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for removal of fluorescent light ballasts/capacitors and fluorescent light tubes. Products shall be as follows or as directed by the the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Before Start of Work: Submit the following to the Owner's Representative for review. Do not start work until these submittals are returned with Owner's Representative's approval.
 - a. Copy of State or local license for hazardous waste hauler;
 - b. Certification of at least one on-site supervisor which has satisfactorily completed the OSHA 40 Hour Health and Safety Course for Handling Hazardous Materials;
 - c. Certificates of workers which have successfully completed at least the OSHA 40-Hour Health and Safety Course for Hazardous Materials;
 - d. List of employees scheduled to perform this work;
 - e. Schedule of start and finish times and dates for this work;
 - f. Name and address of landfill where these waste materials are to be deposited (include contact person and telephone numbers);
 - g. Safety Data Sheets for all materials requiring removal;
 - h. If contractor introduces any chemical into the work environmental, a SDS for that chemical is required before use;
 - i. Transporter must have notified the EPA and/or the appropriate local government agency in advance of its intentions to transport PCB's, mercury and cadmium, and receive an identification number pursuant to the Toxic Substance Control Act (TSCA); and
 - j. Contingency Plan for handling emergency spills or leaks.

1.2 PRODUCTS

A. Materials

1. Polyethylene Sheet: A single polyethylene film in the largest sheet size possible to minimize seams, 4.0 and 6.0 mil thick, clear, frosted, or black.
2. Duct Tape: Provide duct tape in 3" widths, witty an adhesive which is formulated to stick aggressively to sheet polyethylene.
3. Spray Cement: Provide spray adhesive in aerosol cans which is specifically formulated to stick tenaciously to sheet polyethylene.
4. Disposal Bays: Provide 6 mil thick leak-tight polyethylene bags.
5. Labels: As required by the EPA and OSHA for handling, transportation, and disposal of hazardous waste.
6. **Drums:** Recovery or salvage drums acceptable for disposal of hazardous waste. Prior approval of drums is required. Drums or containers must meet the required OSHA EPA (40 CFR Parts 264265 and 300), and DOT regulations (49 CFR Parts 171-178). Use of damaged drums will not be allowed.

1.3 EXECUTION

A. General

1. Where necessary, scaffolding shall be erected to fully access all applicable fluorescent light ballasts/capacitors and tubes. At no time will the ballasts/capacitors and tubes be allowed to drop onto the floor. Contractor must take care to protect from dropping the ballasts/capacitors and fluorescent tubes.
2. Prior to removing ballasts/capacitors and fluorescent tubes, contractor shall ensure that all electrical service to lights has been shut off, and locked out. Temporary lighting shall be erected to adequately illuminate work areas.
3. Depending on height of light fixtures, contractor shall utilize at least a 2-person per team system. The fluorescent light tubes shall be removed and passed to the appropriate number of workers required to lower the tubes to the floor without breaking them.
4. The worker on the floor shall lay the tubes in cardboard boxes large enough to hold a small quantity of tubes. Worker shall take care to not damage the tubes while they are lowered into the box. Once the box is full, it shall be wrapped with two layers of 6 mil thick polyethylene sheeting and sealed with duct tape.
5. Contractor may choose to either remove the fluorescent light ballasts/capacitors in-place or lower the lighting fixtures for easy access. The ballasts/capacitors shall be removed from the fixtures. Electrical wiring leading from the ballasts/capacitors shall be cut away. Ballasts/capacitors shall be placed in 55-gallon drums lined with at least two 6 mil thick polyethylene bags. Be careful not to overfill the drums so that they remain manageable. Once the drums have been filled to the acceptable level, seal the lid onto the top of the drum, and affix appropriate labels. Transport drums via hand dollies.

B. Worker Protection

1. As a minimum, while working with the ballasts/capacitors and light tubes, workers shall utilize impervious gloves adequate for the use with hazardous materials. If light ballasts/capacitors and/or light tubes are damaged, and/or exposure to these materials may reach the OSHA PEL or AGGIH threshold limit value (TLV), the contractor shall be required to provide impervious full body protection and respiratory protection. However, contractor is required to verify the type of protection required prior to working with these materials, and have written approval by Owner's Representative prior to beginning.
2. In addition, workers shall not smoke, drink or eat in these areas during work activities.

C. Storage Of Fluorescent Light Ballasts/Capacitors And Light Tubes

1. Once the containers holding the ballasts/capacitors and light tubes have been filled and sealed, they shall be stored in designated areas as agreed upon by the Owners Representative and Contractor. They shall not be allowed to be stored on-site in transportation vehicles until the time for them to be transported to the hazardous waste incinerators or landfill facility.

END OF SECTION 02 84 16 00

SECTION 02 84 16 00a - INTERIOR LIGHTING

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for interior lighting. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Interior lighting fixtures, lamps, and ballasts.
 - b. Emergency lighting units.
 - c. Exit signs.
 - d. Lighting fixture supports.
 - e. Retrofit kits for fluorescent lighting fixtures.

C. Definitions

1. BF: Ballast factor.
2. CCT: Correlated color temperature.
3. CRI: Color-rendering index.
4. HID: High-intensity discharge.
5. LER: Luminaire efficacy rating.
6. Lumen: Measured output of lamp and luminaire, or both.
7. Luminaire: Complete lighting fixture, including ballast housing if provided.

D. Submittals

1. Product Data: For each type of lighting fixture, arranged in order of fixture designation. Include data on features, accessories, finishes, and the following:
 - a. Physical description of lighting fixture including dimensions.
 - b. Emergency lighting units including battery and charger.
 - c. Ballast, including BF.
 - d. Energy-efficiency data.
 - e. Air and Thermal Performance Data: For air-handling lighting fixtures. Furnish data required in "Submittals" Article in Division 23 Section "Diffusers, Registers, And Grilles".
 - f. Sound Performance Data: For air-handling lighting fixtures. Indicate sound power level and sound transmission class in test reports certified according to standards specified in Division 23 Section "Diffusers, Registers, And Grilles".
 - g. Life, output (lumens, CCT, and CRI), and energy-efficiency data for lamps.
 - h. Photometric data and adjustment factors based on laboratory tests, complying with IESNA Lighting Measurements Testing & Calculation Guides, of each lighting fixture type. The adjustment factors shall be for lamps, ballasts, and accessories identical to those indicated for the lighting fixture as applied in this Project.
 - 1) Testing Agency Certified Data: For indicated fixtures, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining fixtures shall be certified by manufacturer.
OR
Manufacturer Certified Data: Photometric data shall be certified by a manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.
2. Shop Drawings: For nonstandard or custom lighting fixtures. Include plans, elevations, sections, details, and attachments to other work.

02 - Existing Conditions

- a. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - b. Wiring Diagrams: For power, signal, and control wiring.
 3. Samples: For each lighting fixture indicated in the Interior Lighting Fixture Schedule. Each Sample shall include the following:
 - a. Lamps and ballasts, installed.
 - b. Cords and plugs.
 - c. Pendant support system.
 4. Installation instructions.
 5. Coordination Drawings: Reflected ceiling plan(s) and other details, drawn to scale, on which the following items are shown and coordinated with each other, using input from installers of the items involved:
 - a. Lighting fixtures.
 - b. Suspended ceiling components.
 - c. Partitions and millwork that penetrate the ceiling or extends to within **12 inches (305 mm)** of the plane of the luminaires.
 - d. Ceiling-mounted projectors.
 - e. Structural members to which suspension systems for lighting fixtures will be attached.
 - f. Other items in finished ceiling including the following:
 - 1) Air outlets and inlets.
 - 2) Speakers.
 - 3) Sprinklers.
 - 4) Smoke and fire detectors.
 - 5) Occupancy sensors.
 - 6) Access panels.
 - g. Perimeter moldings.
 6. Qualification Data: For qualified agencies providing photometric data for lighting fixtures.
 7. Product Certificates: For each type of ballast for bi-level and dimmer-controlled fixtures, from manufacturer.
 8. Field quality-control reports.
 9. Operation and Maintenance Data: For lighting equipment and fixtures to include in emergency, operation, and maintenance manuals.
 - a. Provide a list of all lamp types used on Project; use ANSI and manufacturers' codes.
 10. Warranty: Sample of special warranty.
- E. Quality Assurance
1. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.
OR
Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910, complying with the IESNA Lighting Measurements Testing & Calculation Guides.
 2. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 3. Comply with NFPA 70.
 4. FM Global Compliance: Lighting fixtures for hazardous locations shall be listed and labeled for indicated class and division of hazard by FM Global.
- F. Coordination
1. Coordinate layout and installation of lighting fixtures and suspension system with other construction that penetrates ceilings or is supported by them, including HVAC equipment, fire-suppression system, and partition assemblies.

G. Warranty

1. Special Warranty for Emergency Lighting Batteries: Manufacturer's standard form in which manufacturer of battery-powered emergency lighting unit agrees to repair or replace components of rechargeable batteries that fail in materials or workmanship within specified warranty period.
 - a. Warranty Period for Emergency Lighting Unit Batteries: 10 years from date of Final Completion. Full warranty shall apply for first year, and prorated warranty for the remaining nine years.
 - b. Warranty Period for Emergency Fluorescent Ballast and Self-Powered Exit Sign Batteries: Seven years from date of Final Completion. Full warranty shall apply for first year, and prorated warranty for the remaining six years.

1.2 PRODUCTS

A. General Requirements For Lighting Fixtures And Components

1. Recessed Fixtures: Comply with NEMA LE 4 for ceiling compatibility for recessed fixtures.
2. Incandescent Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5A.
3. Fluorescent Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5 and NEMA LE 5A as applicable.
4. HID Fixtures: Comply with UL 1598. Where LER is specified, test according to NEMA LE 5B.
5. Metal Parts: Free of burrs and sharp corners and edges.
6. Sheet Metal Components: Steel unless otherwise indicated. Form and support to prevent warping and sagging.
7. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position.
8. Diffusers and Globes:
 - a. Acrylic Lighting Diffusers: 100 percent virgin acrylic plastic. High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
 - 1) Lens Thickness: At least **0.125 inch (3.175 mm)** minimum unless otherwise indicated.
 - 2) UV stabilized.
 - b. Glass: Annealed crystal glass unless otherwise indicated.
9. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps and ballasts. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
 - a. Label shall include the following lamp and ballast characteristics:
 - 1) "USE ONLY" and include specific lamp type.
 - 2) Lamp diameter code (T-4, T-5, T-8, T-12, etc.), tube configuration (twin, quad, triple, etc.), base type, and nominal wattage for fluorescent and compact fluorescent luminaires.
 - 3) Lamp type, wattage, bulb type (ED17, BD56, etc.) and coating (clear or coated) for HID luminaires.
 - 4) Start type (preheat, rapid start, instant start, etc.) for fluorescent and compact fluorescent luminaires.
 - 5) ANSI ballast type (M98, M57, etc.) for HID luminaires.
 - 6) CCT and CRI for all luminaires.
10. Electromagnetic-Interference Filters: Factory installed to suppress conducted electromagnetic interference as required by MIL-STD-461E. Fabricate lighting fixtures with one filter on each ballast indicated to require a filter.
11. Air-Handling Fluorescent Fixtures: For use with plenum ceiling for air return and heat extraction and for attaching an air-diffuser-boot assembly specified in Division 15 Section "Diffusers, Registers, and Grilles."
 - a. Air-Supply Units: Slots in one or both side trims join with air-diffuser-boot assemblies.

02 - Existing Conditions

- b. Heat-Removal Units: Air path leads through lamp cavity.
- c. Combination Heat-Removal and Air-Supply Unit: Heat is removed through lamp cavity at both ends of the fixture door with air supply same as for air-supply units.
- d. Dampers: Operable from outside fixture for control of return-air volume.
- e. Static Fixture: Air-supply slots are blanked off, and fixture appearance matches active units.

B. Ballasts For Linear Fluorescent Lamps

1. General Requirements for Electronic Ballasts:
 - a. Comply with UL 935 and with ANSI C82.11.
 - b. Designed for type and quantity of lamps served.
 - c. Ballasts shall be designed for full light output unless another BF, dimmer, or bi-level control is indicated.
 - d. Sound Rating: Class A **OR** Class A except Class B for T8/HO and T12/Slimline lamp ballasts, **as directed**.
 - e. Total Harmonic Distortion Rating: Less than 10 **OR** 20, **as directed**, percent.
 - f. Transient Voltage Protection: IEEE C62.41.1 and IEEE C62.41.2, Category A or better.
 - g. Operating Frequency: 42 kHz or higher.
 - h. Lamp Current Crest Factor: 1.7 or less.
 - i. BF: 0.88 or higher.
 - j. Power Factor: 0.95 **OR** 0.98, **as directed**, or higher.
 - k. Parallel Lamp Circuits: Multiple lamp ballasts shall comply with ANSI C82.11 and shall be connected to maintain full light output on surviving lamps if one or more lamps fail.
2. Luminaires controlled by occupancy sensors shall have programmed-start ballasts.
3. Electronic Programmed-Start Ballasts for T5 **OR** T8 **OR** T5HO **OR** T5 and T5HO, **as directed**, Lamps: Comply with ANSI C82.11 and the following:
 - a. Lamp end-of-life detection and shutdown circuit for T5 diameter lamps.
 - b. Automatic lamp starting after lamp replacement.
4. Electromagnetic Ballasts: Comply with ANSI C82.1; energy saving, high-power factor, Class P, and having automatic-reset thermal protection.
 - a. Ballast Manufacturer Certification: Indicated by label.
5. Single Ballasts for Multiple Lighting Fixtures: Factory wired with ballast arrangements and bundled extension wiring to suit final installation conditions without modification or rewiring in the field.
6. Ballasts for Low-Temperature Environments:
 - a. Temperatures **0 Deg F (Minus 17 Deg C)** and Higher: Electronic or electromagnetic type rated for **0 deg F (minus 17 deg C)** starting and operating temperature with indicated lamp types.
 - b. Temperatures **Minus 20 Deg F (Minus 29 Deg C)** and Higher: Electromagnetic type designed for use with indicated lamp types.
7. Ballasts for Residential Applications: Fixtures designated as "Residential" may use low-power-factor electronic ballasts having a Class B sound rating and total harmonic distortion of approximately 30 percent.
8. Ballasts for Low Electromagnetic-Interference Environments: Comply with 47 CFR 18, Ch. 1, Subpart C, for limitations on electromagnetic and radio-frequency interference for consumer equipment.
9. Ballasts for Dimmer-Controlled Lighting Fixtures: Electronic type.
 - a. Dimming Range: 100 to 5 percent of rated lamp lumens.
 - b. Ballast Input Watts: Can be reduced to 20 percent of normal.
 - c. Compatibility: Certified by manufacturer for use with specific dimming control system and lamp type indicated.
 - d. Control: Coordinate wiring from ballast to control device to ensure that the ballast, controller, and connecting wiring are compatible.
10. Ballasts for Bi-Level Controlled Lighting Fixtures: Electronic type.

- a. Operating Modes: Ballast circuit and leads provide for remote control of the light output of the associated lamp between high- and low-level and off.
 - 1) High-Level Operation: 100 percent of rated lamp lumens.
 - 2) Low-Level Operation: 30 percent of rated lamp lumens.
 - b. Ballast shall provide equal current to each lamp in each operating mode.
 - c. Compatibility: Certified by manufacturer for use with specific bi-level control system and lamp type indicated.
11. Ballasts for Tri-Level Controlled Lighting Fixtures: Electronic type.
- a. Operating Modes: Ballast circuit and leads provide for remote control of the light output of the associated lamp between high- and low-level and off.
 - 1) High-Level Operation: 100 percent of rated lamp lumens.
 - 2) Low-Level Operation: 30 and 50 **OR** 30 and 60, **as directed**, percent of rated lamp lumens.
 - b. Ballast shall provide equal current to each lamp in each operating mode.
 - c. Compatibility: Certified by manufacturer for use with specific tri-level control system and lamp type indicated.
- C. Ballasts For Compact Fluorescent Lamps
1. Description: Electronic-programmed rapid-start type, complying with UL 935 and with ANSI C 82.11, designed for type and quantity of lamps indicated. Ballast shall be designed for full light output unless dimmer or bi-level control is indicated:
 - a. Lamp end-of-life detection and shutdown circuit.
 - b. Automatic lamp starting after lamp replacement.
 - c. Sound Rating: Class A.
 - d. Total Harmonic Distortion Rating: Less than 20 percent.
 - e. Transient Voltage Protection: IEEE C62.41.1 and IEEE C62.41.2, Category A or better.
 - f. Operating Frequency: 20 kHz or higher.
 - g. Lamp Current Crest Factor: 1.7 or less.
 - h. BF: 0.95 or higher unless otherwise indicated.
 - i. Power Factor: 0.95 **OR** 0.98, **as directed**, except fixtures designated as "Residential" may use low-power-factor electronic ballasts, **as directed**, or higher.
 - j. Interference: Comply with 47 CFR 18, Ch. 1, Subpart C, for limitations on electromagnetic and radio-frequency interference for nonconsumer equipment.
- D. Emergency Fluorescent Power Unit
1. Internal Type: Self-contained, modular, battery-inverter unit, factory mounted within lighting fixture body and compatible with ballast. Comply with UL 924.
 - a. Emergency Connection: Operate one fluorescent lamp(s) continuously at an output of 1100 lumens each. Connect unswitched circuit to battery-inverter unit and switched circuit to fixture ballast.
 - b. Nightlight Connection: Operate one fluorescent lamp continuously.
 - c. Test Push Button and Indicator Light: Visible and accessible without opening fixture or entering ceiling space.
 - 1) Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 - 2) Indicator Light: LED indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
 - d. Battery: Sealed, maintenance-free, nickel-cadmium type.
 - e. Charger: Fully automatic, solid-state, constant-current type with sealed power transfer relay.
 - f. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.

02 - Existing Conditions

- g. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and a flashing red LED.
- 2. External Type: Self-contained, modular, battery-inverter unit, suitable for powering one or more fluorescent lamps, remote mounted from lighting fixture. Comply with UL 924.
 - a. Emergency Connection: Operate one fluorescent lamp continuously. Connect unswitched circuit to battery-inverter unit and switched circuit to fixture ballast.
 - b. Nightlight Connection: Operate one fluorescent lamp in a remote fixture continuously.
 - c. Battery: Sealed, maintenance-free, nickel-cadmium type.
 - d. Charger: Fully automatic, solid-state, constant-current type.
 - e. Housing: NEMA 250, Type 1 enclosure.
 - f. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 - g. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
 - h. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
 - i. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and a flashing red LED.

E. Ballasts For HID Lamps

- 1. Electromagnetic Ballast for Metal-Halide Lamps: Comply with ANSI C82.4 and UL 1029. Include the following features unless otherwise indicated:
 - a. Ballast Circuit: Constant-wattage autotransformer or regulating high-power-factor type.
 - b. Minimum Starting Temperature: **Minus 22 deg F (Minus 30 deg C)** for single-lamp ballasts.
 - c. Rated Ambient Operating Temperature: **104 deg F (40 deg C)**.
 - d. Open-circuit operation that will not reduce average life.
 - e. Low-Noise Ballasts: Manufacturers' standard epoxy-encapsulated models designed to minimize audible fixture noise.
- 2. Electronic Ballast for Metal-Halide Lamps: Include the following features unless otherwise indicated:
 - a. Minimum Starting Temperature: **Minus 20 deg F (Minus 29 deg C)** for single-lamp ballasts.
 - b. Rated Ambient Operating Temperature: **130 deg F (54 deg C)**.
 - c. Lamp end-of-life detection and shutdown circuit.
 - d. Sound Rating: Class A.
 - e. Total Harmonic Distortion Rating: Less than 20 percent.
 - f. Transient Voltage Protection: IEEE C62.41.1 and IEEE C62.41.2, Category A or better.
 - g. Lamp Current Crest Factor: 1.5 or less.
 - h. Power Factor: 0.90 or higher.
 - i. Interference: Comply with 47 CFR 18, Ch. 1, Subpart C, for limitations on electromagnetic and radio-frequency interference for nonconsumer equipment.
 - j. Protection: Class P thermal cutout.
 - k. Bi-Level Dimming Ballast: Ballast circuit and leads provide for remote control of the light output of the associated fixture between high- and low-level and off.
 - 1) High-Level Operation: 100 percent of rated lamp lumens.
 - 2) Low-Level Operation: **35 OR 50, as directed**, percent of rated lamp lumens.
 - 3) Compatibility: Certified by ballast manufacturer for use with specific bi-level control system and lamp type indicated. Certified by lamp manufacturer that ballast operating modes are free from negative effect on lamp life and color-rendering capability.
 - l. Continuous Dimming Ballast: Dimming range shall be from 100 to 35 percent of rated lamp lumens without flicker.

- 1) Ballast Input Watts: Reduced to a maximum of 50 percent of normal at lowest dimming setting.
 3. High-Pressure Sodium Ballasts: Electromagnetic type, with solid-state igniter/starter. Igniter/starter shall have an average life in pulsing mode of 10,000 hours at an igniter/starter-case temperature of 90 deg C.
 - a. Instant-Restrike Device: Integral with ballast, or solid-state potted module, factory installed within fixture and compatible with lamps, ballasts, and mogul sockets up to 150 W.
 - b. Minimum Starting Temperature: **Minus 40 deg F (Minus 40 deg C)**.
- F. Quartz Lamp Lighting Controller
1. General Requirements for Controllers: Factory installed by lighting fixture manufacturer. Comply with UL 1598.
 2. Standby (Quartz Restrike): Automatically switches quartz lamp on when a HID lamp in the fixture is initially energized and during the HID lamp restrike period after brief power outages.
 3. Connections: Designed for a single branch -circuit connection.
 4. Switching Off: Automatically switches quartz lamp off when HID lamp strikes.
- OR**
- Switching Off: Automatically switches quartz lamp off when HID lamp reaches approximately 60 percent light output.
- G. Exit Signs
1. General Requirements for Exit Signs: Comply with UL 924; for sign colors, visibility, luminance, and lettering size, comply with authorities having jurisdiction.
 2. Internally Lighted Signs:
 - a. Lamps for AC Operation: Fluorescent, two for each fixture, 20,000 hours of rated lamp life.

OR

Lamps for AC Operation: LEDs, 50,000 hours minimum rated lamp life.
 - b. Self-Powered Exit Signs (Battery Type): Integral automatic charger in a self-contained power pack.
 - 1) Battery: Sealed, maintenance-free, nickel-cadmium type.
 - 2) Charger: Fully automatic, solid-state type with sealed transfer relay.
 - 3) Operation: Relay automatically energizes lamp from battery when circuit voltage drops to 80 percent of nominal voltage or below. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
 - 4) Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 - 5) LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
 - 6) Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
 - 7) Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and a flashing red LED.
 - c. Master/Remote Sign Configurations:
 - 1) Master Unit: Comply with requirements above for self-powered exit signs, and provide additional capacity in LED power supply **OR** ballast **OR** battery, **as directed**, for power connection to remote unit.
 - 2) Remote Unit: Comply with requirements above for self-powered exit signs, except omit power supply, battery, and test features. Arrange to receive full power requirements from master unit. Connect for testing concurrently with master unit as a unified system.

02 - Existing Conditions

3. Self-Luminous Signs: Powered by tritium gas, with universal bracket for flush-ceiling, wall, or end mounting. Signs shall be guaranteed by manufacturer to maintain the minimum brightness requirements in UL 924 for 10 **OR** 15 **OR** 20, **as directed**, years.

OR

Self-Luminous Signs: Using strontium oxide aluminate compound to store ambient light and release the stored energy when the light is removed. Provide with universal bracket for flush-ceiling, wall, or end mounting.

H. Emergency Lighting Units

1. General Requirements for Emergency Lighting Units: Self-contained units complying with UL 924.
 - a. Battery: Sealed, maintenance-free, lead-acid type.
 - b. Charger: Fully automatic, solid-state type with sealed transfer relay.
 - c. Operation: Relay automatically turns lamp on when power-supply circuit voltage drops to 80 percent of nominal voltage or below. Lamp automatically disconnects from battery when voltage approaches deep-discharge level. When normal voltage is restored, relay disconnects lamps from battery, and battery is automatically recharged and floated on charger.
 - d. Test Push Button: Push-to-test type, in unit housing, simulates loss of normal power and demonstrates unit operability.
 - e. LED Indicator Light: Indicates normal power on. Normal glow indicates trickle charge; bright glow indicates charging at end of discharge cycle.
 - f. Wire Guard: Heavy-chrome-plated wire guard protects lamp heads or fixtures.
 - g. Integral Time-Delay Relay: Holds unit on for fixed interval of 15 minutes when power is restored after an outage.
 - h. Remote Test: Switch in hand-held remote device aimed in direction of tested unit initiates coded infrared signal. Signal reception by factory-installed infrared receiver in tested unit triggers simulation of loss of its normal power supply, providing visual confirmation of either proper or failed emergency response.
 - i. Integral Self-Test: Factory-installed electronic device automatically initiates code-required test of unit emergency operation at required intervals. Test failure is annunciated by an integral audible alarm and a flashing red LED.

I. Fluorescent Lamps

1. T8 rapid-start lamps, rated 32 W maximum, nominal length of **48 inches (1220 mm)**, 2800 initial lumens (minimum), CRI 75 (minimum), color temperature 3500 K, and average rated life 20,000 hours unless otherwise indicated.
2. T8 rapid-start lamps, rated 17 W maximum, nominal length of **24 inches (610 mm)**, 1300 initial lumens (minimum), CRI 75 (minimum), color temperature 3500 K, and average rated life of 20,000 hours unless otherwise indicated.
3. T5 rapid-start lamps, rated 28 W maximum, nominal length of **45.2 inches (1150 mm)**, 2900 initial lumens (minimum), CRI 85 (minimum), color temperature 3000 K, and average rated life of 20,000 hours unless otherwise indicated.
4. T5HO rapid-start, high-output lamps, rated 54 W maximum, nominal length of **45.2 inches (1150 mm)**, 5000 initial lumens (minimum), CRI 85 (minimum), color temperature 4100 K, and average rated life of 20,000 hours unless otherwise indicated.
5. Compact Fluorescent Lamps: 4-Pin, CRI 80 (minimum), color temperature 3500 K, average rated life of 10,000 hours at three hours operation per start, and suitable for use with dimming ballasts, **as directed**.

J. HID Lamps

1. High-Pressure Sodium Lamps: ANSI C78.42, CRI 21 (minimum), color temperature 1900 K, and average rated life of 24,000 hours, minimum.

- a. Dual-Arc Tube Lamps: Arranged so only one of two arc tubes is lighted at one time and, when power is restored after an outage, the cooler arc tube, with lower internal pressure, lights instantly, providing an immediate 8 to 15 percent of normal light output.
 2. Metal-Halide Lamps: ANSI C78.43, with minimum CRI 65, and color temperature 4000 K.
 3. Pulse-Start, Metal-Halide Lamps: Minimum CRI 65, and color temperature 4000 K.
 4. Ceramic, Pulse-Start, Metal-Halide Lamps: Minimum CRI 80, and color temperature 4000 K.
 5. Low-Pressure Sodium Lamps: ANSI 78.41, CRI 0, and color temperature 1800 K.
- K. Lighting Fixture Support Components
1. Comply with Division 26 Section "Hangers And Supports For Electrical Systems" for channel- and angle-iron supports and nonmetallic channel and angle supports.
 2. Single-Stem Hangers: **1/2-inch (13-mm)** steel tubing with swivel ball fittings and ceiling canopy. Finish same as fixture.
 3. Twin-Stem Hangers: Two, **1/2-inch (13-mm)** steel tubes with single canopy designed to mount a single fixture. Finish same as fixture.
 4. Wires: ASTM A 641/A 641M, Class 3, soft temper, zinc-coated steel, **12 gage (2.68 mm)**.
 5. Wires for Humid Spaces: ASTM A 580/A 580M, Composition 302 or 304, annealed stainless steel, **12 gage (2.68 mm)**.
 6. Rod Hangers: **3/16-inch (5-mm)** minimum diameter, cadmium-plated, threaded steel rod.
 7. Hook Hangers: Integrated assembly matched to fixture and line voltage and equipped with threaded attachment, cord, and locking-type plug.
- L. Retrofit Kits For Fluorescent Lighting Fixtures
1. Reflector Kit: UL 1598, Type I. Suitable for two- to four-lamp, surface-mounted or recessed lighting fixtures by improving reflectivity of fixture surfaces.
 2. Ballast and Lamp Change Kit: UL 1598, Type II. Suitable for changing existing ballast, lamps, and sockets.

1.3 EXECUTION

- A. Installation
1. Lighting fixtures:
 - a. Set level, plumb, and square with ceilings and walls unless otherwise indicated.
 - b. Install lamps in each luminaire.
 2. Temporary Lighting: If it is necessary, and approved by the Owner, to use permanent luminaires for temporary lighting, install and energize the minimum number of luminaires necessary. When construction is sufficiently complete, remove the temporary luminaires, disassemble, clean thoroughly, install new lamps, and reinstall.
 3. Remote Mounting of Ballasts: Distance between the ballast and fixture shall not exceed that recommended by ballast manufacturer. Verify, with ballast manufacturers, maximum distance between ballast and luminaire.
 4. Lay-in Ceiling Lighting Fixtures Supports: Use grid as a support element.
 - a. Install ceiling support system rods or wires, independent of the ceiling suspension devices, **as directed**, for each fixture. Locate not more than **6 inches (150 mm)** from lighting fixture corners.
 - b. Support Clips: Fasten to lighting fixtures and to ceiling grid members at or near each fixture corner with clips that are UL listed for the application.
 - c. Fixtures of Sizes Less Than Ceiling Grid: Install as indicated on reflected ceiling plans or center in acoustical panel, and support fixtures independently with at least two **3/4-inch (20-mm)** metal channels spanning and secured to ceiling tees.
 - d. Install at least one independent support rod or wire from structure to a tab on lighting fixture. Wire or rod shall have breaking strength of the weight of fixture at a safety factor of 3.
 5. Suspended Lighting Fixture Support:
 - a. Pendants and Rods: Where longer than **48 inches (1200 mm)**, brace to limit swinging.

02 - Existing Conditions

- b. Stem-Mounted, Single-Unit Fixtures: Suspend with twin-stem hangers.
 - c. Continuous Rows: Use tubing or stem for wiring at one point and tubing or rod for suspension for each unit length of fixture chassis, including one at each end.
 - d. Do not use grid as support for pendant luminaires. Connect support wires or rods to building structure.
6. Air-Handling Lighting Fixtures: Install with dampers closed and ready for adjustment.
7. Connect wiring according to Division 26 Section "Low-voltage Electrical Power Conductors And Cables".
- B. Identification
- 1. Install labels with panel and circuit numbers on concealed junction and outlet boxes. Comply with requirements for identification specified in Division 26 Section "Identification For Electrical Systems".
- C. Field Quality Control
- 1. Test for Emergency Lighting: Interrupt power supply to demonstrate proper operation. Verify transfer from normal power to battery and retransfer to normal.
 - 2. Verify that self-luminous exit signs are installed according to their listing and the requirements in NFPA 101.
 - 3. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.
- D. Startup Service
- 1. Burn-in all lamps that require specific aging period to operate properly, prior to occupancy by the Owner. Burn-in fluorescent and compact fluorescent lamps intended to be dimmed, for at least 100 hours at full voltage.
- E. Adjusting
- 1. Occupancy Adjustments: When requested within 12 months of date of Final Completion, provide on-site assistance in adjusting aimable luminaires to suit actual occupied conditions. Provide up to two visits to Project during other-than-normal occupancy hours for this purpose. Some of this work may be required after dark.
 - a. Adjust aimable luminaires in the presence of the Owner.

END OF SECTION 02 84 16 00a

SECTION 02 84 16 00b - EXTERIOR LIGHTING

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for exterior lighting. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Exterior luminaires with lamps and ballasts.
 - b. Luminaire-mounted photoelectric relays.
 - c. Poles and accessories.
 - d. Luminaire lowering devices.

C. Definitions

1. CCT: Correlated color temperature.
2. CRI: Color-rendering index.
3. HID: High-intensity discharge.
4. LER: Luminaire efficacy rating.
5. Luminaire: Complete lighting fixture, including ballast housing if provided.
6. Pole: Luminaire support structure, including tower used for large area illumination.
7. Standard: Same definition as "Pole" above.

D. Structural Analysis Criteria For Pole Selection

1. Dead Load: Weight of luminaire and its horizontal and vertical supports, lowering devices, and supporting structure, applied as stated in AASHTO LTS-4-M.
2. Live Load: Single load of **500 lbf (2224 N)**, distributed as stated in AASHTO LTS-4-M.
3. Ice Load: Load of **3 lbf/sq. ft. (145 Pa)**, applied as stated in AASHTO LTS-4-M Ice Load Map.
4. Wind Load: Pressure of wind on pole and luminaire and banners and banner arms, calculated and applied as stated in AASHTO LTS-4-M.
 - a. Basic wind speed for calculating wind load for poles exceeding **49.2 feet (15 m)** in height is **100 mph (45 m/s) OR 90 mph (40 m/s), as directed.**
 - 1) Wind Importance Factor: 1.0.
 - 2) Minimum Design Life: 50 years.
 - 3) Velocity Conversion Factors: 1.0.
 - b. Basic wind speed for calculating wind load for poles **50 feet (15 m)** high or less is **100 mph (45 m/s) OR 90 mph (40 m/s).**
 - 1) Wind Importance Factor: 1.0.
 - 2) Minimum Design Life: 25 years.
 - 3) Velocity Conversion Factors: 1.0.

E. Submittals

1. Product Data: For each luminaire, pole, and support component, arranged in order of lighting unit designation. Include data on features, accessories, finishes, and the following:
 - a. Physical description of luminaire, including materials, dimensions, effective projected area, and verification of indicated parameters.
 - b. Details of attaching luminaires and accessories.
 - c. Details of installation and construction.
 - d. Luminaire materials.
 - e. Photometric data based on laboratory tests of each luminaire type, complete with indicated lamps, ballasts, and accessories.

- 1) Testing Agency Certified Data: For indicated luminaires, photometric data shall be certified by a qualified independent testing agency. Photometric data for remaining luminaires shall be certified by manufacturer.
OR
Manufacturer Certified Data: Photometric data shall be certified by manufacturer's laboratory with a current accreditation under the National Voluntary Laboratory Accreditation Program for Energy Efficient Lighting Products.
 - f. Photoelectric relays.
 - g. Ballasts, including energy-efficiency data.
 - h. Lamps, including life, output, CCT, CRI, lumens, and energy-efficiency data.
 - i. Materials, dimensions, and finishes of poles.
 - j. Means of attaching luminaires to supports, and indication that attachment is suitable for components involved.
 - k. Anchor bolts for poles.
 - l. Manufactured pole foundations.
 2. Shop Drawings: Include plans, elevations, sections, details, and attachments to other work.
 - a. Detail equipment assemblies and indicate dimensions, weights, loads, required clearances, method of field assembly, components, and location and size of each field connection.
 - b. Anchor-bolt templates keyed to specific poles and certified by manufacturer.
 - c. Design calculations, certified by a qualified professional engineer, indicating strength of screw foundations and soil conditions on which they are based.
 - d. Wiring Diagrams: For power, signal, and control wiring.
 3. Samples: For products designated for sample submission in the Exterior Lighting Device Schedule. Each Sample shall include lamps and ballasts.
 4. Pole and Support Component Certificates: Signed by manufacturers of poles, certifying that products are designed for indicated load requirements in AASHTO LTS-4-M and that load imposed by luminaire and attachments has been included in design. The certification shall be based on design calculations by a professional engineer.
 5. Qualification Data: For qualified agencies providing photometric data for lighting fixtures.
 6. Field quality-control reports.
 7. Operation and Maintenance Data: For luminaires and poles **OR** luminaire lowering devices, **as directed**, to include in emergency, operation, and maintenance manuals.
 8. Warranty: Sample of special warranty.
- F. Quality Assurance
1. Luminaire Photometric Data Testing Laboratory Qualifications: Provided by manufacturers' laboratories that are accredited under the National Volunteer Laboratory Accreditation Program for Energy Efficient Lighting Products.
OR
Luminaire Photometric Data Testing Laboratory Qualifications: Provided by an independent agency, with the experience and capability to conduct the testing indicated, that is an NRTL as defined by OSHA in 29 CFR 1910.
 2. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
 3. Comply with IEEE C2, "National Electrical Safety Code."
 4. Comply with NFPA 70.
- G. Delivery, Storage, And Handling
1. Package aluminum poles for shipping according to ASTM B 660.
 2. Store poles on decay-resistant-treated skids at least **12 inches (300 mm)** above grade and vegetation. Support poles to prevent distortion and arrange to provide free air circulation.
 3. Handle wood poles so they will not be damaged. Do not use pointed tools that can indent pole surface more than **1/4 inch (6 mm)** deep. Do not apply tools to section of pole to be installed below ground line.

4. Retain factory-applied pole wrappings on fiberglass and laminated wood poles until right before pole installation. Handle poles with web fabric straps.
5. Retain factory-applied pole wrappings on metal poles until right before pole installation. For poles with nonmetallic finishes, handle with web fabric straps.

H. Warranty

1. Special Warranty: Manufacturer's standard form in which manufacturer agrees to repair or replace products that fail in materials or workmanship; that corrode; or that fade, stain, perforate, erode, or chalk due to effects of weather or solar radiation within specified warranty period. Manufacturer may exclude lightning damage, hail damage, vandalism, abuse, or unauthorized repairs or alterations from special warranty coverage.
 - a. Warranty Period for Luminaires: Five years from date of Final Completion.
 - b. Warranty Period for Metal Corrosion: Five years from date of Final Completion.
 - c. Warranty Period for Color Retention: Five years from date of Final Completion.
 - d. Warranty Period for Poles: Repair or replace lighting poles and standards that fail in finish, materials, and workmanship within manufacturer's standard warranty period, but not less than three years from date of Final Completion.

1.2 PRODUCTS

A. General Requirements For Luminaires

1. Luminaires shall comply with UL 1598 and be listed and labeled for installation in wet locations by an NRTL acceptable to authorities having jurisdiction.
 - a. LER Tests Incandescent Fixtures: Where LER is specified, test according to NEMA LE 5A.
 - b. LER Tests Fluorescent Fixtures: Where LER is specified, test according to NEMA LE 5 and NEMA LE 5A as applicable.
 - c. LER Tests HID Fixtures: Where LER is specified, test according to NEMA LE 5B.
2. Lateral Light Distribution Patterns: Comply with IESNA RP-8 for parameters of lateral light distribution patterns indicated for luminaires.
3. Metal Parts: Free of burrs and sharp corners and edges.
4. Sheet Metal Components: Corrosion-resistant aluminum unless otherwise indicated. Form and support to prevent warping and sagging.
5. Housings: Rigidly formed, weather- and light-tight enclosures that will not warp, sag, or deform in use. Provide filter/breather for enclosed luminaires.
6. Doors, Frames, and Other Internal Access: Smooth operating, free of light leakage under operating conditions, and designed to permit relamping without use of tools. Designed to prevent doors, frames, lenses, diffusers, and other components from falling accidentally during relamping and when secured in operating position. Doors shall be removable for cleaning or replacing lenses. Designed to disconnect ballast when door opens.
7. Exposed Hardware Material: Stainless steel.
8. Plastic Parts: High resistance to yellowing and other changes due to aging, exposure to heat, and UV radiation.
9. Light Shields: Metal baffles, factory installed and field adjustable, arranged to block light distribution to indicated portion of normally illuminated area or field.
10. Reflecting surfaces shall have minimum reflectance as follows unless otherwise indicated:
 - a. White Surfaces: 85 percent.
 - b. Specular Surfaces: 83 percent.
 - c. Diffusing Specular Surfaces: 75 percent.
11. Lenses and Refractors Gaskets: Use heat- and aging-resistant resilient gaskets to seal and cushion lenses and refractors in luminaire doors.
12. Luminaire Finish: Manufacturer's standard paint applied to factory-assembled and -tested luminaire before shipping. Where indicated, match finish process and color of pole or support materials.
13. Factory-Applied Finish for Steel Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.

02 - Existing Conditions

- a. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning," to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning," or SSPC-SP 8, "Pickling."
 - b. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.
 - 1) Color: As selected from manufacturer's standard catalog of colors **OR** As selected from manufacturer's full range, **as directed**.
14. Factory-Applied Finish for Aluminum Luminaires: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
- a. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
 - b. Natural Satin Finish: Provide fine, directional, medium satin polish (AA-M32); buff complying with AA-M20; and seal aluminum surfaces with clear, hard-coat wax.
 - c. Class I, Clear Anodic Finish: AA-M32C22A41 (Mechanical Finish: medium satin; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.
 - d. Class I, Color Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: medium satin; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker) complying with AAMA 611.
 - 1) Color: Light bronze **OR** Medium bronze **OR** Dark bronze **OR** Black, **as directed**.
15. Factory-Applied Labels: Comply with UL 1598. Include recommended lamps and ballasts. Labels shall be located where they will be readily visible to service personnel, but not seen from normal viewing angles when lamps are in place.
- a. Label shall include the following lamp and ballast characteristics:
 - 1) "USES ONLY" and include specific lamp type.
 - 2) Lamp diameter code (T-4, T-5, T-8, T-12), tube configuration (twin, quad, triple), base type, and nominal wattage for fluorescent and compact fluorescent luminaires.
 - 3) Lamp type, wattage, bulb type (ED17, BD56, etc.) and coating (clear or coated) for HID luminaires.
 - 4) Start type (preheat, rapid start, instant start) for fluorescent and compact fluorescent luminaires.
 - 5) ANSI ballast type (M98, M57, etc.) for HID luminaires.
 - 6) CCT and CRI for all luminaires.
- B. Luminaire-Mounted Photoelectric Relays
1. Comply with UL 773 or UL 773A.
 2. Contact Relays: Factory mounted, single throw, designed to fail in the on position, and factory set to turn light unit on at **1.5 to 3 fc (16 to 32 lx)** and off at **4.5 to 10 fc (48 to 108 lx)** with 15-second minimum time delay. Relay shall have directional lens in front of photocell to prevent artificial light sources from causing false turnoff, **as directed**.
 - a. Relay with locking-type receptacle shall comply with ANSI C136.10.
 - b. Adjustable window slide for adjusting on-off set points.
- C. Fluorescent Ballasts And Lamps
1. Ballasts for Low-Temperature Environments:
 - a. Temperatures **0 Deg F (Minus 17 Deg C)** and Higher: Electronic or electromagnetic type rated for **0 deg F (minus 17 deg C)** starting and operating temperature with indicated lamp types.
 - b. Temperatures **Minus 20 Deg F (Minus 29 Deg C)** and Higher: Electromagnetic type designed for use with indicated lamp types.
 2. Ballast Characteristics:
 - a. Power Factor: 90 percent, minimum.

- b. Sound Rating: Class A **OR** Class A except Class B for T8/HO ballasts, **as directed**.
 - c. Total Harmonic Distortion Rating: Less than 10 **OR** 20, **as directed**, percent.
 - d. Electromagnetic Ballasts: Comply with ANSI C82.1, energy-saving, high power factor, Class P, automatic-reset thermal protection.
 - e. Case Temperature for Compact Lamp Ballasts: 65 deg C, maximum.
 - f. Transient-Voltage Protection: Comply with IEEE C62.41.1 and IEEE C62.41.2, Category A or better.
3. Low-Temperature Lamp Capability: Rated for reliable starting and operation with ballast provided at temperatures **0 deg F (minus 18 deg C) OR minus 20 deg F (minus 29 deg C)**, **as directed**, and higher.
- D. Ballasts For HID Lamps
1. Comply with ANSI C82.4 and UL 1029 and capable of open-circuit operation without reduction of average lamp life. Include the following features unless otherwise indicated:
 - a. Ballast Circuit: Constant-wattage autotransformer or regulating high-power-factor type.
 - b. Minimum Starting Temperature: **Minus 22 deg F (Minus 30 deg C)**.
 - c. Normal Ambient Operating Temperature: **104 deg F (40 deg C)**.
 - d. Ballast Fuses: One in each ungrounded power supply conductor. Voltage and current ratings as recommended by ballast manufacturer.
 2. Auxiliary, Instant-On, Quartz System: Factory-installed feature automatically switches quartz lamp on when fixture is initially energized and when momentary power outages occur. System automatically turns quartz lamp off when HID lamp reaches approximately 60 percent of light output.
 3. High-Pressure Sodium Ballasts: Electromagnetic type with solid-state igniter/starter and capable of open-circuit operation without reduction of average lamp life. Igniter/starter shall have an average life in pulsing mode of 10,000 hours at an igniter/starter-case temperature of 90 deg C.
 - a. Instant-Restrike Device: Integral with ballast, or solid-state potted module, factory installed within fixture and compatible with lamps, ballasts, and mogul sockets up to 150 W.
 - 1) Restrike Range: 105- to 130-V ac.
 - 2) Maximum Voltage: 250-V peak or 150-V ac rms.
 - b. Minimum Starting Temperature: **Minus 40 deg F (Minus 40 deg C)**.
- E. HID Lamps
1. High-Pressure Sodium Lamps: ANSI C78.42, CRI 21 (minimum), CCT color temperature 1900 K, and average rated life of 24,000 hours, minimum.
 - a. Dual-Arc Tube Lamp: Arranged so only one of two arc tubes is lighted at one time and, when power is restored after an outage, the cooler arc tube, with lower internal pressure, lights instantly, providing an immediate 8 to 15 percent of normal light output.
 2. Low-Pressure Sodium Lamps: ANSI C78.43.
 3. Metal-Halide Lamps: ANSI C78.43, with minimum CRI 65, and CCT color temperature 4000 K.
 4. Pulse-Start, Metal-Halide Lamps: Minimum CRI 65, and CCT color temperature 4000 K.
 5. Ceramic, Pulse-Start, Metal-Halide Lamps: Minimum CRI 80, and CCT color temperature 4000 K.
- F. General Requirements For Poles And Support Components
1. Structural Characteristics: Comply with AASHTO LTS-4-M.
 - a. Wind-Load Strength of Poles: Adequate at indicated heights above grade without failure, permanent deflection, or whipping in steady winds of speed indicated in "Structural Analysis Criteria for Pole Selection" Article.
 - b. Strength Analysis: For each pole, multiply the actual equivalent projected area of luminaires and brackets by a factor of 1.1 to obtain the equivalent projected area to be used in pole selection strength analysis.
 2. Luminaire Attachment Provisions: Comply with luminaire manufacturers' mounting requirements. Use stainless-steel fasteners and mounting bolts unless otherwise indicated.
 3. Mountings, Fasteners, and Appurtenances: Corrosion-resistant items compatible with support components.

02 - Existing Conditions

- a. Materials: Shall not cause galvanic action at contact points.
- b. Anchor Bolts, Leveling Nuts, Bolt Caps, and Washers: Hot-dip galvanized after fabrication unless otherwise indicated.
- c. Anchor-Bolt Template: Plywood or steel.
4. Handhole: Oval-shaped, with minimum clear opening of **2-1/2 by 5 inches (65 by 130 mm)**, with cover secured by stainless-steel captive screws. Provide on all, except wood poles.
5. Concrete Pole Foundations: Cast in place, with anchor bolts to match pole-base flange. Concrete, reinforcement, and formwork are specified in Division 3 Section "Cast-in-Place Concrete."
6. Power-Installed Screw Foundations: Factory fabricated by pole manufacturer, with structural steel complying with ASTM A 36/A 36M and hot-dip galvanized according to ASTM A 123/A 123M; and with top-plate and mounting bolts to match pole base flange and strength required to support pole, luminaire, and accessories.
7. Breakaway Supports: Frangible breakaway supports, tested by an independent testing agency acceptable to authorities having jurisdiction, according to AASHTO LTS-4-M.

G. Steel Poles

1. Poles: Comply with ASTM A 500, Grade B, carbon steel with a minimum yield of **46,000 psig (317 MPa)**; one-piece construction up to **40 feet (12 m)** in height with access handhole in pole wall.
 - a. Shape: Round, tapered **OR** Round, straight **OR** Square, tapered **OR** Square, straight, **as directed**.
 - b. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.
2. Steel Mast Arms: Single-arm **OR** Truss **OR** Davit, **as directed**, type, continuously welded to pole attachment plate. Material and finish same as pole.
3. Brackets for Luminaires: Detachable, cantilever, without underbrace.
 - a. Adapter fitting welded to pole, allowing the bracket to be bolted to the pole mounted adapter, then bolted together with stainless **OR** galvanized, **as directed**,-steel bolts.
 - b. Cross Section: Tapered oval, with straight tubular end section to accommodate luminaire.
 - c. Match pole material and finish.
4. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.
5. Steps: Fixed steel, with nonslip treads, positioned for **15-inch (381-mm)** vertical spacing, alternating on opposite sides of pole; first step at elevation **10 feet (3 m)** above finished grade.
6. Intermediate Handhole and Cable Support: Weathertight, **3-by-5-inch (76-by-127-mm)** handhole located at midpoint of pole with cover for access to internal welded attachment lug for electric cable support grip.
7. Grounding and Bonding Lugs: Welded **1/2-inch (13-mm)** threaded lug, complying with requirements in Division 26 Section "Grounding And Bonding For Electrical Systems", listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.
8. Cable Support Grip: Wire-mesh type with rotating attachment eye, sized for diameter of cable and rated for a minimum load equal to weight of supported cable times a 5.0 safety factor.
9. Platform for Lamp and Ballast Servicing: Factory fabricated of steel with finish matching that of pole.
10. Prime-Coat Finish: Manufacturer's standard prime-coat finish ready for field painting.
11. Galvanized Finish: After fabrication, hot-dip galvanize complying with ASTM A 123/A 123M.
12. Factory-Painted Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 - a. Surface Preparation: Clean surfaces to comply with SSPC-SP 1, "Solvent Cleaning," to remove dirt, oil, grease, and other contaminants that could impair paint bond. Grind welds and polish surfaces to a smooth, even finish. Remove mill scale and rust, if present, from uncoated steel, complying with SSPC-SP 5/NACE No. 1, "White Metal Blast Cleaning," or with SSPC-SP 8, "Pickling."

- b. Interior Surfaces of Pole: One coat of bituminous paint, or otherwise treat for equal corrosion protection.
 - c. Exterior Surfaces: Manufacturer's standard finish consisting of one or more coats of primer and two finish coats of high-gloss, high-build polyurethane enamel.
 - 1) Color: As indicated by manufacturer's designations **OR** As selected from manufacturer's full range, **as directed**.
- H. Aluminum Poles
- 1. Poles: Seamless, extruded structural tube complying with ASTM B 429/B 429M, Alloy 6063-T6 with access handhole in pole wall.
 - 2. Poles: **ASTM B 209 (ASTM B 209M)**, 5052-H34 marine sheet alloy with access handhole in pole wall.
 - a. Shape: Round, tapered **OR** Round, straight **OR** Square, tapered **OR** Square, straight, **as directed**.
 - b. Mounting Provisions: Butt flange for bolted mounting on foundation or breakaway support.
 - 3. Pole-Top Tenons: Fabricated to support luminaire or luminaires and brackets indicated, and securely fastened to pole top.
 - 4. Grounding and Bonding Lugs: Welded **1/2-inch (13-mm)** threaded lug, complying with requirements in Division 26 Section "Grounding And Bonding For Electrical Systems", listed for attaching grounding and bonding conductors of type and size listed in that Section, and accessible through handhole.
 - 5. Brackets for Luminaires: Detachable, with pole and adapter fittings of cast aluminum. Adapter fitting welded to pole and bracket, then bolted together with stainless-steel bolts.
 - a. Tapered oval cross section, with straight tubular end section to accommodate luminaire.
 - b. Finish: Same as pole **OR** luminaire, **as directed**.
 - 6. Prime-Coat Finish: Manufacturer's standard prime-coat finish ready for field painting.
 - 7. Aluminum Finish: Comply with NAAMM's "Metal Finishes Manual for Architectural and Metal Products" for recommendations for applying and designating finishes.
 - a. Finish designations prefixed by AA comply with the system established by the Aluminum Association for designating aluminum finishes.
 - b. Natural Satin Finish: Provide fine, directional, medium satin polish (AA-M32); buff complying with AA-M20; and seal aluminum surfaces with clear, hard-coat wax.
 - c. Class I, Clear Anodic Finish: AA-M32C22A41 (Mechanical Finish: medium satin; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, clear coating 0.018 mm or thicker) complying with AAMA 611.
 - d. Class I, Color Anodic Finish: AA-M32C22A42/A44 (Mechanical Finish: medium satin; Chemical Finish: etched, medium matte; Anodic Coating: Architectural Class I, integrally colored or electrolytically deposited color coating 0.018 mm or thicker) complying with AAMA 611.
 - 1) Color: Light bronze **OR** Medium bronze **OR** Dark bronze **OR** Black **OR** As selected from manufacturer's full range, **as directed**.
- I. Fiberglass Poles
- 1. Poles: Designed specifically for supporting luminaires, with factory-formed cable entrance and handhole. Not less than 65 percent fiberglass, with resin and pigment making up the remainder.
 - a. Resin Color: Dark bronze; provide uniform coloration throughout entire wall thickness.
 - b. Surface Finish: Pigmented polyurethane, with a minimum dry film thickness of **1.5 mils (0.04 mm)**. Polyurethane may be omitted if the surface layer of pole is inherently UV inhibited.
- J. Decorative Poles
- 1. Pole Material:
 - a. Cast ductile iron.
 - b. Cast gray iron, according to ASTM A 48/A 48M, Class 30.
 - c. Cast aluminum.
 - d. Cast concrete.

02 - Existing Conditions

- e. Spun concrete.
 - f. Steel tube, covered with closed-cell polyurethane foam, with a polyethylene exterior.
 2. Mounting Provisions:
 - a. Bolted to concrete foundation.
 - b. Embedded.
 3. Fixture Brackets:
 - a. Cast ductile iron.
 - b. Cast gray iron.
 - c. Cast aluminum.
 4. Pole Finish: as directed by the Owner .
- K. Laminated Wood Poles
1. Species and Grades for Structural Glulam Timber: Engineer and fabricate structural laminated wood poles, complying with ANSI A190.1. Use southern pine **OR** Douglas fir **OR** Alaska cedar **OR** any species listed in AITC 117, **as directed**, to withstand indicated structural loads without exceeding allowable design working stresses according to AITC 117.
 2. Features: Include wood bracket **OR** wood crossarm **OR** pole-top adapter, **as directed**, for mounting luminaire(s), metal pole cap, **as directed**, and concealed raceway path connected to access handhole.
 3. Mounting Provisions: Embedded.
 4. Appearance Grade: Architectural appearance grade complying with AITC 110.
 5. Preservative Treatment: Pressure treat lumber before gluing according to AWWA C28 for waterborne preservatives. After dressing and end-cutting each member to final size and shape, apply a field-treatment preservative to comply with AWWA M4 to surfaces cut to a depth of more than **1/16 inch (1.6 mm)**.
 6. Adhesive: Wet-use type complying with ASTM D 2559.
 7. End Sealer: Manufacturer's standard, transparent, colorless wood sealer that is effective in retarding the transmission of moisture at cross-grain cuts and is compatible with indicated finish.
 8. Penetrating Sealer: Manufacturer's standard, transparent, penetrating wood sealer that is compatible with indicated finish.
 9. Finish: Natural, unstained wood **OR** Semitransparent stain applied after erection **OR** Semitransparent stain applied at factory, **as directed**, color as selected.
- L. Wood Poles
1. Poles: Douglas fir **OR** Southern yellow pine, **as directed**, machine trimmed by turning, **as directed**, complying with ANSI O5.1 and with AWWA C4 for wood species used; and bored, roofed, and gabled before treatment.
 - a. Mounting Provisions: Embedded.
 2. Preservative Treatment: Pressure treat poles with creosote **OR** pentachlorophenol **OR** ammoniacal copper arsenate, **as directed**, according to AWWA C1 and AWWA C4.
 3. Luminaire Brackets: Comply with ANSI C136.13.
- M. Prestressed Concrete Poles
1. Poles: Manufactured by centrifugal spin-casting process **OR** of cast concrete, **as directed**.
 - a. Shape: Round, tapered **OR** Round, straight **OR** Square, tapered **OR** Square, straight, **as directed**.
 - b. Mounting Provisions: Steel butt flange for bolted mounting to foundation or breakaway support **OR** Embedded, **as directed**.
 - c. Finishing: Capped at top and plugged at bottom. Seat each steel reinforcing strand with epoxy adhesive.
 - d. Grounding: Continuous copper ground wire cast into pole. Terminate at top of pole and attach to **24-inch (610-mm)** lightning rod, **as directed**.
 2. Cure with wet steam and age for a minimum of 15 days before installation.
 3. Fabricate poles with a hard, nonporous surface that is resistant to water, frost, and road and soil chemicals and that has a maximum water-absorption rate of 3 percent.

4. Cast aluminum nameplate into pole wall at approximately **5 feet (1.5 m)** above ground line, listing name of manufacturer, Project identifier, overall height, and approximate weight.
5. Pole Brackets: Comply with ANSI C136.13.
6. Finish Color: Provided by color material complying with ASTM C 979, uniformly impregnated throughout the pole concrete. Color material shall provide a uniform, stable, permanent color and be as follows:
 - a. Inert, and carbon free.
 - b. Unaffected by environmental conditions and contaminants including, but not limited to, UV solar radiation, salts, and alkalis.
7. Finish Texture: Standard form **OR** Polished exposed aggregate **OR** Etched exposed aggregate, **as directed**.
 - a. Exposed aggregate shall be of **Aggregate type selected from manufacturers' lists** as directed by the Owner type.

N. Pole Accessories

1. Duplex Receptacle: 120 V, 20 A in a weatherproof assembly complying with Division 16 Section "Wiring Devices" for ground-fault circuit-interrupter type.
 - a. Surface mounted **OR** Recessed, **as directed**, **12 inches (300 mm)** above finished grade.
 - b. Nonmetallic polycarbonate plastic or reinforced fiberglass, weatherproof in use, cover, that when mounted results in NEMA 250, Type 3R **OR** Type 4X, **as directed**, enclosure.
 - c. With cord opening.
 - d. With lockable hasp and latch that complies with OSHA lockout and tag-out requirements.
2. Minimum 1800-W transformer, protected by replaceable fuses, mounted behind access cover.
3. Base Covers: Manufacturers' standard metal units, arranged to cover pole's mounting bolts and nuts. Finish same as pole.
4. Transformer Type Base: Same material and color as pole. Coordinate dimensions to suit pole's base flange and accept ballast(s) **OR** indicated accessories, **as directed**.
5. Decorative accessories, supplied by decorative pole manufacturer, include the following:
 - a. Banner Arms: as directed by the Owner .
 - b. Flag Holders: as directed by the Owner .
 - c. Ladder Rests: as directed by the Owner .

O. Lowering System For Luminaires

1. Arrange system to lower luminaire **OR** luminaire assembly, **as directed**, to a servicing position within **36 inches (900 mm)** of finished grade in winds up to **30 mph (49 km/h)** and to provide for manual plug connection to electrical power in the lowered position for testing.
2. Coordinate with luminaire and pole manufacturers for assembly details, wind-load and vibration analysis, and compatibility of materials for electrolysis-free attachment and connection for luminaire mounting assembly, lowering device, lowering cable, and portable winch.
3. Structural and Mechanical Design: Use a minimum safety factor of 5.0 for static and dynamic loads of load-bearing components, including cable.
4. Luminaire Mounting and Disconnect Arrangement: Multiple ring **OR** carriage, **as directed**, -mounted luminaires, arranged for lowering and rising as a group.
 - a. Electrical cable for normal operating power to luminaires manually disconnects inside pole base, using weatherproof multipin connector, and shall be arranged to move within the pole during lowering and rising of luminaire assembly.
OR
Electrical cable for normal operating power to luminaires automatically disconnects at a weatherproof multipin connector within the pole-top lowering head at the beginning of the lowering cycle and reconnects when luminaire or luminaire assembly is raised to the operating position.
5. Lowering Device: Weatherproof, cast-aluminum housing and multiple mechanical latches. Moving parts of latching assembly shall be located in the portion of the unit that is lowered to the servicing position. Positive latching in the operating position shall be indicated to the operator at the base of the pole by a clear visual signal, or by other means acceptable to the Owner or authorities having jurisdiction.

02 - Existing Conditions

6. Lowering Cable: Zinc-electroplated- or stainless-steel aircraft cable.
7. Portable Winch: Manual **OR** 120-V electric, **as directed**, type. One required.
 - a. Winch Power Connection: Cord and plug.
 - b. Winch Raise-Lower Control: Remote-control station with **15 feet (5 m)** of cable.
8. Winch Transformer: Portable, totally enclosed, encapsulated, single-phase, dry type. Primary rated at lighting-circuit voltage; secondary rated at 120 V. Permanent, primary and secondary, twist-locking plug connectors on pigtails shall match pole-base power outlet and winch plug.

1.3 EXECUTION

A. Luminaire Installation

1. Install lamps in each luminaire.
2. Fasten luminaire to indicated structural supports.
 - a. Use fastening methods and materials selected to resist seismic forces defined for the application and approved by manufacturer.
3. Adjust luminaires that require field adjustment or aiming. Include adjustment of photoelectric device to prevent false operation of relay by artificial light sources, favoring a north orientation, **as directed**.

B. Pole Installation

1. Alignment: Align pole foundations and poles for optimum directional alignment of luminaires and their mounting provisions on the pole.
2. Clearances: Maintain the following minimum horizontal distances of poles from surface and underground features unless otherwise indicated on Drawings:
 - a. Fire Hydrants and Storm Drainage Piping: **60 inches (1520 mm)**.
 - b. Water, Gas, Electric, Communication, and Sewer Lines: **10 feet (3 m)**.
 - c. Trees: **15 feet (5 m)** from tree trunk.
3. Concrete Pole Foundations: Set anchor bolts according to anchor-bolt templates furnished by pole manufacturer. Concrete materials, installation, and finishing requirements are specified in Division 03 Section "Cast-in-place Concrete".
4. Foundation-Mounted Poles: Mount pole with leveling nuts, and tighten top nuts to torque level recommended by pole manufacturer.
 - a. Use anchor bolts and nuts selected to resist seismic forces defined for the application and approved by manufacturer.
 - b. Grout void between pole base and foundation. Use nonshrink or expanding concrete grout firmly packed to fill space.
 - c. Install base covers unless otherwise indicated.
 - d. Use a short piece of **1/2-inch- (13-mm-)** diameter pipe to make a drain hole through grout. Arrange to drain condensation from interior of pole.
5. Embedded Poles with Tamped Earth Backfill: Set poles to depth below finished grade indicated on Drawings, but not less than one-sixth of pole height.
 - a. Dig holes large enough to permit use of tampers in the full depth of hole.
 - b. Backfill in **6-inch (150-mm)** layers and thoroughly tamp each layer so compaction of backfill is equal to or greater than that of undisturbed earth.
6. Embedded Poles with Concrete Backfill: Set poles in augered holes to depth below finished grade indicated on Drawings, but not less than one-sixth of pole height.
 - a. Make holes **6 inches (150 mm)** in diameter larger than pole diameter.
 - b. Fill augered hole around pole with air-entrained concrete having a minimum compressive strength of **3000 psi (20 MPa)** at 28 days, and finish in a dome above finished grade.
 - c. Use a short piece of **1/2-inch- (13-mm-)** diameter pipe to make a drain hole through concrete dome. Arrange to drain condensation from interior of pole.
 - d. Cure concrete a minimum of 72 hours before performing work on pole.
7. Poles and Pole Foundations Set in Concrete Paved Areas: Install poles with minimum of **6-inch- (150-mm-)** wide, unpaved gap between the pole or pole foundation and the edge of adjacent

- concrete slab. Fill unpaved ring with pea gravel to a level **1 inch (25 mm)** below top of concrete slab.
8. Raise and set poles using web fabric slings (not chain or cable).
- C. Bollard Luminaire Installation
1. Align units for optimum directional alignment of light distribution.
 2. Install on concrete base with top **4 inches (100 mm)** above finished grade or surface at bollard location. Cast conduit into base, and shape base to match shape of bollard base. Finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Division 03 Section "Cast-in-place Concrete".
- D. Installation Of Individual Ground-Mounting Luminaires
1. Install on concrete base with top **4 inches (100 mm)** above finished grade or surface at luminaire location. Cast conduit into base, and finish by troweling and rubbing smooth. Concrete materials, installation, and finishing are specified in Division 03 Section "Cast-in-place Concrete".
- E. Corrosion Prevention
1. Aluminum: Do not use in contact with earth or concrete. When in direct contact with a dissimilar metal, protect aluminum by insulating fittings or treatment.
 2. Steel Conduits: Comply with Division 26 Section "Raceway And Boxes For Electrical Systems". In concrete foundations, wrap conduit with **0.010-inch- (0.254-mm-)** thick, pipe-wrapping plastic tape applied with a 50 percent overlap.
- F. Grounding
1. Ground metal poles and support structures according to Division 26 Section "Grounding And Bonding For Electrical Systems".
 - a. Install grounding electrode for each pole unless otherwise indicated.
 - b. Install grounding conductor pigtail in the base for connecting luminaire to grounding system.
 2. Ground nonmetallic poles and support structures according to Division 26 Section "Grounding And Bonding For Electrical Systems".
 - a. Install grounding electrode for each pole.
 - b. Install grounding conductor and conductor protector.
 - c. Ground metallic components of pole accessories and foundations.
- G. Field Quality Control
1. Inspect each installed fixture for damage. Replace damaged fixtures and components.
 2. Illumination Observations: Verify normal operation of lighting units after installing luminaires and energizing circuits with normal power source.
 - a. Verify operation of photoelectric controls.
 3. Illumination Tests:
 - a. Measure light intensities at night. Use photometers with calibration referenced to NIST standards. Comply with the following IESNA testing guide(s):
 - 1) IESNA LM-5, "Photometric Measurements of Area and Sports Lighting Installations."
 - 2) IESNA LM-50, "Photometric Measurements of Roadway Lighting Installations."
 - 3) IESNA LM-52, "Photometric Measurements of Roadway Sign Installations."
 - 4) IESNA LM-64, "Photometric Measurements of Parking Areas."
 - 5) IESNA LM-72, "Directional Positioning of Photometric Data."
 4. Prepare a written report of tests, inspections, observations, and verifications indicating and interpreting results. If adjustments are made to lighting system, retest to demonstrate compliance with standards.
- H. Demonstration
1. Train the Owner's maintenance personnel to adjust, operate, and maintain luminaire lowering devices.

END OF SECTION 02 84 16 00b

SECTION 02 84 33 00 - OVERHEAD ELECTRICAL DISTRIBUTION

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for overhead electrical distribution. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Conductors, connectors, and splices.
 - b. Poles and crossarms.
 - c. Hardware and accessories.
 - d. Surge arresters.
 - e. Cutouts, switches, and fuses.
 - f. Pole-mounted distribution transformers.
 - g. Primary metering equipment.

C. Definitions

1. BIL: Basic impulse level, stated in kilovolts.
2. RUS: Department of Agriculture, Rural Utilities Service.
3. Sag: The distance measured vertically from a conductor to the straight line joining its two points of support, measured at the midpoint of the span, unless otherwise indicated.
 - a. Final Sag: The sag of a conductor under specified conditions of loading and temperature applied after it has been subjected, for an appreciable period, to the loading prescribed for the loading district in which it is situated, or equivalent loading, and the loading removed. Final sag includes the effect of inelastic deformation (creep).
 - b. Initial Unloaded Sag: The sag of a conductor before the application of an external load.
4. Secondary: Conductors and components for circuits operating at the utilization voltage of 600 V or less.
5. Service: Set of insulated conductors extending from a pole to the metering point or service entrance connection at the location of utilization of electricity.

D. Submittals

1. Product Data: For each type of product indicated. Include construction details, material descriptions, dimensions of individual components and profiles, and finishes.
2. Qualification Data: For qualified manufacturer **OR** testing agency, **as directed**.
3. Material Certificates: For the following items, from manufacturers:
 - a. Wood poles.
 - b. Concrete poles.
 - c. Wood crossarms.
4. Listing Documentation: Indicate that products comply with RUS listing requirements specified in "Quality Assurance" Article.
 - a. Time-Current Coordination Curves: Illustrate optimum coordination of protective devices involved in the Work of this Section.
 - b. Source quality-control test reports.
5. Field quality-control reports.
6. Operation and Maintenance Data: For switches **OR** transformers, **as directed**, to include in emergency, operation, and maintenance manuals.
7. Survey records for locations of pole, anchors, and other features for inclusion in Project Record Documents.

02 - Existing Conditions

E. Quality Assurance

1. Concrete Pole Manufacturer Qualifications: Certified by PCI as a qualified manufacturer of concrete utility poles of type and size indicated for this Project.
2. Inspection Agency Qualifications for Pole and Crossarm Inspection: An independent agency, acceptable to authorities having jurisdiction, qualified to conduct inspections indicated.
3. Testing Agency Qualifications: Member company of NETA or an NRTL.
4. Testing Agency's Field Supervisor: Currently certified by NETA or an NRTL.
5. Treatment Technician Qualifications for Field Treatment of Wood Poles and Crossarms: Certified by authorities having jurisdiction over environmental protection at the location of Project for field application of chemicals required.
6. Electrical Components, Devices, and Accessories: Listed and labeled as defined in NFPA 70, by a qualified testing agency, and marked for intended location and application.
7. Overhead-Line Components, Devices, and Accessories: Currently listed in RUS Informational Publication 202-1 without restriction for the intended application.
8. Comply with IEEE C2 **OR** CPUC General Order 95, **as directed**, except where stricter requirements are indicated or where local requirements that are stricter apply.
9. Strength of Line and Line Components Selected by Contractor: Provide grades of construction and strength required by IEEE C2 for conditions encountered at Project site for heavy **OR** medium **OR** light, **as directed**, line loading unless otherwise indicated.

F. Delivery, Storage, And Handling

1. Wood Pole Storage and Handling: Comply with ATIS O5.1. Do not use pointed handling tools capable of producing indentations greater than **1 inch (25 mm)**.

G. Project Conditions

1. Interruption of Existing Service: Do not interrupt service to facilities occupied by Owner or others unless permitted under the following conditions and then only after arranging to provide temporary service according to requirements indicated:
 - a. Notify Owner no fewer than two days in advance of proposed interruption of service.
 - b. Do not proceed with interruption of service without Owner's written permission.

H. Coordination

1. Coordinate with utility supplying electricity to lines specified in this Section, and make final connections **OR** arrangements for final connections by utility, **as directed**.
2. Coordinate with those responsible for voice **OR** data **OR** video, **as directed**, systems that will have cables supported by poles installed according to this Section.

1.2 PRODUCTS

A. Conductors, Connectors, And Splices

1. Conductor Type AAC: Bare **OR** Bare and covered, **as directed**, all-aluminum, Alloy 1350-H19, complying with ASTM B 230/B 230M and ASTM B 231/B 231M.
OR
Conductor Type AAAC: Bare **OR** Bare and covered, **as directed**, all-aluminum-alloy, Alloy 6201-T81, complying with ASTM B 398/B 398M and ASTM B 399/B 399M.
OR
Conductor Type ACSR: Bare **OR** Bare and covered, **as directed**, aluminum conductor, steel reinforced, complying with ASTM B 232/B 232M.
OR
Conductor Type CU: Bare **OR** Bare and covered, **as directed**, hard-drawn copper, complying with ASTM B 1 and ASTM B 8.
2. Conductor Covering: UV resistant, complying with ICEA-S-70-547. HDPE **OR** XLP, **as directed**, **150 mils (3.81 mm)** thick.

3. Self-Supported, Multiconductor, Insulated Medium-Voltage Wiring: Factory-assembled, messenger-supported type, listed under UL 1072 as sunlight-resistant Type MV cable for cable tray use.
 - a. Conductors: Aluminum, Alloy 1350, complying with ASTM B 230/B 230M and ASTM B 231/B 231M **OR** Hard-drawn copper, complying with ASTM B 1 and ASTM B 8, **as directed**; stranded for No. 2 AWG and larger.
 - b. Conductor Insulation: XLP, complying with NEMA WC 70/ICEA S-95-658 **OR** EPR, complying with NEMA WC 70/ICEA S-95-658, **as directed**.
 - c. Insulation Level: 100 **OR** 133, **as directed**, percent of rated circuit line-to-line voltage.
 - d. Conductor Shield: Extruded, nonconducting, thermoset material, complying with NEMA WC 70/ICEA S-95-658; **18-mil (0.046-mm)** minimum thickness.
 - e. Insulation Shield: Include the following two components:
 - 1) Nonmetallic conducting, material complying with NEMA WC 70/ICEA S-95-658 and UL 1072, extruded over, and free stripping from the insulation.
 - 2) Metallic Tape Shield: Bare copper, **5-mil (0.127-mm)** minimum thickness, helically applied with a 15 percent minimum overlap.
 - f. Conductor Jacket: Extruded, chlorosulfonated-polyethylene-based material, complying with NEMA WC 70/ICEA S-95-658.
 - g. Messenger: Copper **OR** Composite copper and copper, **as directed**, -clad steel.
 - h. Conductor Support Strap: Copper strap, wound around conductors and messenger the full length of the cable.
4. Secondary-Voltage Line Conductors: Aluminum conductor, steel **reinforced**, complying with ASTM B 232/B 232M **OR** Covered aluminum conductor, steel reinforced, complying with ICEA S-70-547, with HDPE or XLP covering, **as directed**, **60 mils (1.52 mm)** thick.

OR

Secondary-Voltage Line Conductors: Bare hard-drawn copper, complying with ASTM B 1 and ASTM B 8 **OR** Covered hard-drawn copper, complying with ICEA S-70-547, with HDPE or XLP covering, **as directed**, **60 mils (1.52 mm)** thick. Neutral-supported, secondary service-drop cable, **as directed**.

OR

Racked Secondary Conductors, 600 V and Less: Copper, insulated with XLP, complying with NEMA WC 70/ICEA S-95-658, **as directed**.
5. Neutral-Supported, Secondary Service-Drop Cable, 600 V and Less: Insulated conductors with bare neutral, complying with ICEA S-76-474, and using the following combination of materials:
 - a. Conductors and Neutral: Copper with copper-clad-steel neutral **OR** Aluminum with bare Alloy 1350 aluminum neutral **OR** Aluminum with ACSR neutral, **as directed**.
 - b. Insulation: XLP, complying with NEMA WC 70/ICEA S-95-658 **OR** High-modular-weight, low-density polyethylene **OR** Weather-resistant polyolefin, complying with ICEA S-70-547, **as directed**.
6. Connectors, Splices, and Conductor Securing and Protecting Components: Items include wire clamps, ties, conductor armor, fittings, connectors, and terminals. Listed for the specific applications and conductor types and combinations of materials used. Descriptions as follows for various applications:
 - a. Copper to Copper: Copper alloy, complying with UL 486A-486B.
 - b. Aluminum Composition to Aluminum Composition: Aluminum alloy, complying with UL 486A-486B.
 - c. Copper to Aluminum Composition: Type suitable for this purpose, complying with UL 486A-486B.
 - d. Connectors and Splices for Secondary Conductors: Listed and labeled for the conditions and materials involved in each application.
 - e. Taps for Medium-Voltage Line Conductors: Hot-line clamps, screw type, with concealed threads and bare, hard-drawn copper stirrups. Listed for the combination of materials being connected.
 - f. Splices under Tension: Compression type with strength exceeding the conductors spliced.

02 - Existing Conditions

- g. Splices and Terminations for Covered Conductors: As recommended by conductor manufacturer for conductor and covering combination and for specific materials and physical arrangement of each splice.
 - h. Splices and Terminations for Insulated Medium-Voltage Conductors: Comply with requirements in Division 26 Section "Medium-voltage Cables".
- B. Wood Poles
- 1. Comply with ATIS O5.1 and RUS Bulletin 1728F-700, for wood poles pressure treated with creosote **OR** pentachlorophenol, **as directed**, **OR** ammoniacal copper arsenate, **OR** ammoniacal copper zinc arsenate **OR** chromated copper arsenate, **as directed**.
 - 2. Wood Species: Douglas fir **OR** Lodgepole pine **OR** Western larch **OR** Southern yellow pine, **as directed**.
 - 3. Pole Marking:
 - a. Manufacturer's Mark: Comply with ATIS O5.1; locate **10 feet (3 m)** from the pole butt for poles **50 feet (15 m)** long or less.
 - b. Pole Number: Machine-embossed aluminum, alphanumeric characters not less than **2-1/2 inches (65 mm)** high, with aluminum nails.
 - 4. Factory Operations: Machine trim poles by turning smooth, full length. Roof, gain, and bore poles before pressure treatment.
- C. Concrete Poles
- 1. Description: Spun-cast prestressed concrete, complying with requirements of ASTM C 1089.
 - a. Comply with requirements of RUS Bulletin 1724E-216.
 - 2. Design: Base design on calculation of strength required by IEEE C2 or indicated on Drawings, whichever is greater. Design shall be suitable for installation at a location where annual temperature range is between **minus 4 deg F and plus 100 deg F (minus 20 deg C and plus 38 deg C)**. Include pole design for embedded attachments matching fittings, brackets, and other items installed in the field.
 - 3. Shaft: Hollow, for poles at overhead-to-underground connections. Provide **3-1/2-inch- (89-mm-)** minimum cable raceway capacity, with conduit elbow **OR** cable entry port, **as directed**, at base.
 - 4. Water Absorption: Not more than 3 percent.
 - 5. Surface: Smooth, hard, nonporous, and resistant to soil acids **OR** road salts **OR** frost and freezing damage, **as directed**.
 - 6. Pole Marking:
 - a. Manufacturer's Mark: Comply with ATIS O5.1; locate **10 feet (3 m)** from the pole butt for poles **50 feet (15 m)** long or less.
 - b. Pole Number: Machine-embossed aluminum, alphanumeric characters not less than **2-1/2 inches (65 mm)** high.
- D. Crossarms
- 1. Description: Solid-wood distribution type, complying with RUS Bulletin 1728H-701 for specified construction grade **OR** Galvanized, steel angles, **as directed**, and complying with IEEE C2 for required climbing space and wire clearances.
 - 2. Braces: Galvanized, flat, ferrous-metal units; **1/4 inch (6 mm)** thick by **1-1/4 inches (30 mm)** wide, minimum, with length to suit crossarm dimensions.
- E. Guys And Anchors
- 1. Guy Strand Assemblies: Cable and attachment assemblies shall have uniform minimum breaking strength of the cable.
 - 2. Cable: Seven strands. Zinc-coated steel, complying with ASTM A 475 **OR** Aluminum-clad steel, complying with ASTM B 416 **OR** Copper-clad steel, complying with ASTM B 228, **as directed**. Breaking strength shall be not less than 10,000 lb (45 kN).
 - 3. Cable Termination:
 - 1) Thimble eye.**OR**

- 2) Hooks and guy strain plates, complying with IEEE C135.1.
 - 2) Preformed galvanized-steel guy grips, matching material, galvanizing, and strength of the guy strand assembly.
 4. Anchor and Anchor-Rod Assemblies: Hot-dip galvanized steel.
 - a. Power-installed screw-type anchors.
 - 1) 15-inch (380-mm) screw; with rod 96 inches (2400 mm) long by 1-1/2 inches (38 mm) in diameter. Rated at 10,000 lb (45 kN) when installed.
 - 2) Guy anchors shall have strength and holding area as required for anchor load and soil conditions at location of that anchor.
 5. Strain Insulators: Epoxy-bonded fiberglass of length to meet clearance requirements specified in "Guy Installation" Article.
 6. Guy Markers: Round, of vinyl or PVC material, white **OR** yellow, **as directed**, color, 96 inches (2440 mm) long. Shatter resistant at temperatures below 0 deg F (minus 18 deg C).
- F. Hardware And Accessories
1. Description: Ferrous-metal items include, but are not limited to, bolts, nuts, washers, crossarm gains and braces, insulator pins, anchor rods, anchors, eyebolts, staples, and transformer brackets.
 - a. Comply with IEEE C135.1, IEEE C135.2, ANSI C135.4, ANSI C135.22, and RUS Informational Publication 202-1 listings with the exception that base material shall be malleable iron or ductile iron, and finish shall be hot-dip galvanized, **as directed**.
 2. Insulator Brackets: Hot-dip galvanized steel, style as indicated, designed to hold vertical-post-type or pin-type insulators, with one **OR** two, **as directed**, -bolt attachment to pole.
 3. Secondary Insulator Racks: Hot-dip galvanized steel, style as indicated, with smooth, rounded 12-gage struts designed to support two **OR** three **OR** four, **as directed**, spool insulators for attachment of secondary drop conductors. Spool spacing of 4 inches (100 mm) **OR** 8 inches (200 mm) **OR** 12 inches (300 mm), **as directed**.
 4. Pole Riser Shields: Galvanized steel with boot **OR** backplate **OR** vent, **as directed**.
 5. Padlocks: ASTM F 883.
 - a. Class: PO1 **OR** PO2, **as directed**.
 - b. Grade: 1 **OR** 2 **OR** 3 **OR** 4 **OR** 5 **OR** 6, **as directed**.
 - c. Option: A **OR** B **OR** C **OR** D **OR** E **OR** F **OR** G, **as directed**.
 6. Insulators: Units rated 6 kV and above shall be free from radio interference.
 - a. Porcelain insulators shall be wet-process type, complying with the following:
 - 1) Pin: ANSI C29.5.
 - 2) Line Post: ANSI C29.7. Include mounting stud of length suitable for each mounting arrangement used.
 - 3) Suspension: ANSI C29.2.
 - 4) Guy Strain: ANSI C29.4.
 - 5) Secondary Spool: ANSI C29.3, Class 53-2.
 - b. Polymer-composite, fiberglass-reinforced insulators shall comply with the following:
 - 1) Line Post: CEA LWIWG-02.
 - 2) Dead End/Suspension: CEA LWIWG-01.
 - 3) Guy Strain: Fiberglass reinforced, epoxy finished. Designed specifically for use in guy assemblies.
 7. Grounding Materials: Comply with Division 26 Section "Grounding And Bonding For Electrical Systems", using materials listed by RUS for the intended purpose without restriction.
 - a. Conductors: No. 4 AWG, minimum; bare, solid, annealed copper, complying with ASTM B 8 unless otherwise indicated.
 - b. Ground Conductor Protectors: PVC or half-round wood molding, fir, pressure treated according to AWWA C25 **OR** cypress **OR** cedar, **as directed**.
- G. Surge Arresters
1. Distribution-Class Surge Arresters: Porcelain **OR** Polymer, **as directed**, -enclosed, gapless, metal-oxide type with automatic-indicating type, ground-lead disconnection feature, **as directed**, complying with IEEE C62.11 and NEMA LA 1.

02 - Existing Conditions

2. Intermediate-Class Surge Arresters: Porcelain **OR** Polymer, **as directed**, -enclosed, gapless, metal-oxide type, complying with IEEE C62.11 and NEMA LA 1.
 - a. Voltage Rating: 3 **OR** 6 **OR** 9 **OR** 10 **OR** 12 **OR** 15 **OR** 27 **OR** 30 **OR** 36, **as directed**, kV, at the altitude of Project, unless otherwise indicated.
- H. Cutouts, Switches, And Fuses
 1. Description: Medium-voltage disconnect, protective, and bypass, **as directed**, units shall be rated for the line-to-line voltage of the systems in which installed, unless higher ratings are indicated. BIL ratings are 45 **OR** 60 **OR** 75 **OR** 95 **OR** 150 **OR** 200, **as directed**, kV.
 - a. Momentary Current Rating of Switching Devices: 20 **OR** 40, **as directed**, kA, asymmetrical at nominal system operating voltage.
 - b. Fuse Characteristics: Time-current characteristics for each set of fuses selected according to written recommendations of manufacturer of component protected by the fuses and coordinated with upstream and downstream protective devices. Prepare time-current coordination curves according to IEEE 242 that illustrate optimum coordination of devices in this Project.
 - c. Interrupting Rating of Fuses: **Value** as directed by the Owner symmetrical A at nominal system operating voltage.
 2. Fuse Cutouts: Open **OR** enclosed, **as directed**, type, rated 100 **OR** 200, **as directed**, A, continuous, complying with ANSI C37.42.
 - a. Fuses: Enclosed link, Type K **OR** Type T, **as directed**, complying with ANSI C37.42.
 - b. Fuse Current Rating: 150 percent of the transformer full-load current unless otherwise indicated.
 - c. Switching Application: Include switch link instead of fuse.
 - d. Switch Current Interrupting Rating: Transformer magnetizing current.
 3. Fused Switches: Single-pole, manual units.
 - a. Switch Rating: 400 **OR** 600, **as directed**, -A rms continuous and load-current interrupting.
 - b. Fuses: Dropout-type power fuses.
 4. Nonfused Switches: Single-pole, manual units, rated 100 **OR** 200 **OR** 400 **OR** 600, **as directed**, -A rms continuous.
 5. Group-Operated, Load-Interrupter Switches: Fused **OR** Nonfused, **as directed**, three-pole, single-throw units, manually operated by handle through insulated mechanical linkage.
 - a. High-pressure contact type, complying with ANSI C37.32.
 - b. Factory assembled to suit specific configuration and mounting conditions for this Project.
 - c. Operating Handle: Padlock equipped.
 - d. Current Interrupting Rating: Equal to continuous current rating of switch.
 - e. Fuses: Nondropout power type.
 6. Group-Operated, Air-Break (Nonloadbreak) Switches: Three-pole, single-throw units, manually operated by handle through insulated mechanical linkage.
 - a. Comply with ANSI C37.32.
 - b. Factory assembled to suit specific configuration and mounting conditions for this Project.
 - c. Operating Handle: Padlock equipped.
 - d. Suitable for field conversion to load-interrupter switch by adding interrupter modules.
- I. Distribution Transformers
 1. Description: Single-phase, two-winding, single **OR** two, **as directed**, -bushing, liquid-filled, self-cooled, pole-mounting distribution type, suitable for external fuse and surge suppressor protection; complying with IEEE C 57.12.00, and tested according to IEEE C 57.12.90 and with the following additional requirements, **as directed**:
 - a. Cooling Class: OA.
 - b. Temperature Rise: 65 deg C.
 - c. Insulating Liquid: Mineral oil, ASTM D 3487, Type II.
OR
Insulating Liquid: High molecular weight, mineral oil based, and UL listed as less-flammable type.

OR

Insulating Liquid: Biodegradable insulating and cooling liquid, UL listed as less flammable type.

- d. Identification: Label the transformer as "non-PCB" and place manufacturer's name and type of fluid on the nameplate.
 2. BIL: 95 **OR** 75 **OR** 60, **as directed**, kV.
 3. Taps: Two, 2.5 percent above and below **OR** Four, 2.5 percent below, **as directed**, high-voltage and full-load rated. Tap changer shall have an external operating handle, **as directed**.
 4. Mounting Brackets: Single **OR** Double, **as directed**, integral; suitable for pole mounting, individually or in cluster, or on crossarm.
 5. Minimum Efficiency: Class 1, as defined by NEMA TP 1, based on test results that comply with requirements of NEMA TP 2.
 6. Bushings: Creepage distance shall exceed nominal value standard for unit rating by at least 75 percent.
 7. Hardware: Stainless steel.
 8. Tank and Cover: Stainless steel, complying with ASTM A 167, Type 304 or 304L, with paint coating exterior finish system complying with IEEE C57.12.28, including manufacturer's standard color finish coat.
 9. Show transformer kiloampere capacity using 2-1/2-inch (65-mm) numerals placed near the low-voltage bushings.
- J. Primary Metering Equipment
1. Metering Transformers: Outdoor current and potential transformers, designed for crossarm mounting, complying with IEEE C57.13, and having the following features:
 - a. BIL: 45 **OR** 60 **OR** 75 **OR** 95 **OR** 150 **OR** 200, **as directed**, kV.
 - b. Secondary connection box arranged for conduit connection.
 - c. Potential-Transformer Voltage Rating: 2.4 **OR** 4.16 **OR** 7.2 **OR** 12.0 **OR** 12.47, **as directed**, kV to 120-V ac, 60 Hz.
 - d. Potential-Transformer Accuracy Class: Minimum 0.3 at 75-VA burden.
 - e. Voltage Rating: 2.4 **OR** 4.16 **OR** 7.2 **OR** 12.0 **OR** 12.47, **as directed**, kV.
 - f. Current Rating: as directed by the Owner to 5 A.
 - g. Accuracy Class: Minimum 0.2 at 50-VA burden.
 2. Watt-Hour Meter: Outdoor solid-state unit, with demand register, **OR** arranged for pulse initiation, **as directed**, complying with ANSI C12.10, and including the following ratings and features:
 - a. Form: 8S **OR** 9S, **as directed**.
 - b. Element: 2 **OR** 2-1/2 **OR** 3, **as directed**.
 - c. Voltage: 120 V.
 - d. Current: 2-1/2 A.
 - e. Frequency: 60 Hz.
 - f. Kilowatt-Hour Register: Five-digit type.
 - g. Demand-Register Multiplier: A quantity in even hundreds, indicated on meter face.
 - h. Demand-Register Interval: 15 **OR** 30, **as directed**, minutes.
 - i. Mounting: On matching socket, complying with ANSI C12.7, and complete with automatic current short-circuiting device.
 - j. Meter Test Block: Matched to meter, and furnished and equipped with open knife switches designed to isolate each metering component for test.
 - k. Meter Cabinet: Galvanized steel; weatherproof enclosure with pole-mounting bracket and the following features:
 - 1) Hinged Door: Arranged for padlocking in closed position.
 - 2) Size: Adequate to house meter and other equipment indicated, but not less than **20 by 30 by 11 inches (510 by 760 by 280 mm)** deep.
- K. Source Quality Control
1. Factory Tests: Conduct routine tests of transformers **OR** medium-voltage switches **OR** metering equipment, **as directed**, according to referenced standards.

02 - Existing Conditions

2. Testing Agency: Engage a qualified testing agency to inspect poles and crossarms before and after preservative treatment for compliance of wood poles and crossarms with requirements indicated. RUS quality mark "WQC" on each item is acceptable in place of inspection as evidence of compliance.
3. Poles and crossarms will be considered defective if they do not pass tests and inspections.
4. Prepare test and inspection reports.

1.3 EXECUTION

A. Right-Of-Way Clearance And Tree Trimming

1. Clear right of way according to Division 01 Section(s) "Temporary Tree And Plant Protection" AND Division 31 Section(s) "Site Clearing".
2. Clear right of way to maintain minimum clearances required by IEEE C2, unless Drawings indicate greater clearances or greater clearances are required by state or local codes or regulations. If no minimum requirements are mandated, maintain a minimum of **15 feet (4.5 m)** on both sides horizontally and below medium-voltage conductors and **60 inches (1500 mm)** on both sides horizontally and below secondary-voltage conductors. Remove overhanging branches.

B. General Installation Requirements

1. Install underground power and metering circuits and those circuits indicated to be in raceways according to Division 26 Section "Underground Ducts And Raceways For Electrical Systems" and Division 26 Section "Medium-voltage Cables", and make splices and terminations for those circuits according to the applicable Sections.
2. Engage the services of a licensed surveyor to verify dimensions by field measurement, to identify locations of poles, anchors, and other features, and to verify all clearances. The survey document shall also identify locations of connections to new and existing supply lines and to primary and secondary services. Notify the Owner of discrepancies and field conditions that are not indicated and that will affect installation.
3. Ground equipment according to Division 26 Section "Grounding And Bonding For Electrical Systems".
4. Apply warning signs and equipment labels according to Division 26 Section "Identification For Electrical Systems".

C. Conductor Installation, General

1. Handle and string conductors to prevent cuts, gouges, scratches, kinks, flattening, or deformation. Remove damaged sections and splice conductors.
 - a. String new conductors to "initial" sag values recommended by manufacturer for type and size of conductor except as otherwise indicated.
 - b. Conductors Reinstalled or Resagged: String to "final" sag values recommended by manufacturer for type and size of conductor except as otherwise indicated.
2. Connections, Splices, and Terminations: Use kits listed for the specific type of connection and combination of materials in the connection or recommended for the specific use by manufacturer of material on which applied.
 - a. Splice Location: Do not install within **10 feet (3 m)** of a support.
 - b. Line Conductors and Service Drops: Install so strength exceeds ultimate rated strength of conductor.
 - c. Splices and Terminations of Covered Conductors: Comply with manufacturer's written instructions.
 - d. Splices and Terminations of Insulated Conductors of Self-Supported, Medium-Voltage Cable: Comply with manufacturer's written instructions.

D. Medium-Voltage Line Conductor Installation

1. Application: Install bare conductors unless otherwise indicated.

2. Armor Rod: Install to protect conductors if line conductors are supported by insulators.
 3. Flat Aluminum Armor Wire: Install to protect conductors if they are supported by, or attached to, galvanized or coated iron or steel clamps or fittings.
 4. Support line conductors and taps as follows:
 - a. Use wire ties for conductor attachment to pin and vertical post insulators unless otherwise indicated.
 - b. Install wire ties tight against conductor and insulator, and turn ends back and flat against conductor, to eliminate exposed wire ends.
 - c. Use wire clamps on horizontal post, dead end, and suspension insulators unless otherwise indicated.
- E. Pole And Crossarm Installation
1. Pole Orientation: Align curve of curved wood poles with straight-line runs of three or more poles. Align gained surfaces perpendicular to runs.
 2. Elevation of Line above Grade: Install poles with top at same elevation, unless grade changes dictate elevation change in poles, and according to the following:
 - a. On level ground, set poles so tops of consecutive poles vary not more than **60 inches (1500 mm)** in elevation.
 - b. Shorten wood poles by cutting off the top and make cuts to shed water. Apply preservative to cuts.
 3. Set poles according to the following:
 - a. Make pole holes vertical, uniform in diameter, and large enough to permit effective use of tamping bars all around. Bore or excavate holes with an average diameter at grade less than twice the diameter of the pole at the same grade.
 - b. Use minimum depths indicated, except at locations where hole is partly or entirely in rock and if hole is not vertical or has a diameter at grade more than two times the pole diameter at the same level; in these conditions, increase the depth of the hole by the following increments before setting the pole:
 - 1) Poles up to **35 Feet (10.6 m)** Long: **24 inches (600 mm)**.
 - 2) Poles **36 to 60 Feet (11 to 18.3 m)** Long: **30 inches (760 mm)**.
 - 3) Poles **61 to 75 Feet (18.6 to 22.9 m)** Long: **36 inches (900 mm)**.
 - c. For poles on slopes, indicated hole depth is from finished grade at lowest side of hole.
 - d. Set poles in alignment and plumb except at dead ends, angles, and points of extra strain; rake poles against conductor strain **1 inch (25 mm)** minimum, **2 inches (51 mm)** maximum, (after conductors are installed at required tension) for each **10 feet (3 m)** of pole length. Rake poles so they will not lean or bend in direction of strain when loaded.
 - e. Backfill holes in **6-inch (150-mm)** maximum lifts, and thoroughly tamp each layer before starting the next.
 - f. Place surplus earth around pole in a conical shape, and tamp thoroughly to provide drainage away from pole.
 - g. Set poles so alternate crossarm gains face in alternate directions, except at terminals and dead ends; place gains on last two poles on side facing terminal or dead end.
 - h. Poles Set in Concrete Paved Areas: Install poles with minimum of **6-inch- (150-mm-)** wide, unpaved gap between the pole and the edge of adjacent concrete slab. Fill unpaved ring with pea gravel to a level **1 inch (25 mm)** below top of concrete slab.
 4. Field treat factory-treated poles and crossarms as follows:
 - a. Poles Treated More Than One Year before Installation: Treat portion from **24 inches (600 mm)** above ground line to butt.
 - b. Field-Bored Holes and Field-Cut Gains and Pole Tops: Treat cut portions.
 - c. Unused Holes: Treat and plug with treated-wood-dowel drive pins.
 - d. Engage the services of a technician certified according to "Quality Assurance" Article to apply treatment. Comply with requirements in AWPA standards that govern original factory treatment for field-applied treatment and application of chemicals.
 5. Crossarm Installation: Set line crossarms at right angle to line for straight runs and for angles 45 degrees and more. Bisect angles less than 45 degrees.
 - a. Buck Arms: Install at corners and junction poles unless otherwise indicated.

02 - Existing Conditions

- b. Double Crossarms: Install at dead ends, corners, angles, and line crossings.
 - c. Equipment Arms: Locate below lines and set parallel or at right angles to them, whichever provides best climbing space.
 - d. Gains: Install factory-cut or metal-pole gains only. Do not cut gains in field without specific written approval.
6. Locate pole numbers to provide maximum visibility from the road or patrol route.

F. Guy Installation

1. Install guys to resist unbalanced loads, including those developed at angles, corners, and dead ends. Install two or more guys if a single guy will not provide adequate strength. Install separate guys if unbalanced loads are separated by **36 inches (900 mm)** or more. Comply with IEEE C2.
 - a. Unless a thimble eye is used, at the pole end, install a minimum of two guy hooks and two guy strain plates.
 - b. At the anchor end, attach guy strand assembly with preformed grips.
2. Protect guy strands from damage. Replace damaged guy strands. Install guy insulators where required to comply with IEEE C2 clearance requirements.
3. Install guys with a lead-to-height ratio of 1 to 1 unless otherwise indicated. The minimum lead-to-height ratio shall be 1/2 to 1. When less than 1 to 1, increase guy strength by the ratio of the sine of the lead angle indicated to the sine of the lead angle provided.
4. Install screw-type guy anchors aligned in soil with guy. Set with anchor rod pointing at guy attachment on pole and rod projecting **6 to 9 inches (150 to 230 mm)** from ground.
5. Install strain insulators to provide a minimum of **12 inches (300 mm)** of clearance between the nearest energized surface and the strain insulator fitting farthest from the pole. When loaded to the tension indicated, fiberglass strain insulators shall be loaded to not more than two-thirds of manufacturer's published rating.
6. Guy Markers: Install at anchor end of guys to visually mark the guy wire at all accessible locations. Clamp to guy strand or anchor at top and bottom of marker.

G. Hardware And Accessories Installation

1. Install washers against wood and under nuts, including eyenuts and locknuts.
2. Install nuts and locknuts wrench-tight on threaded connections.

H. Insulator Installation

1. Medium-Voltage Line Application: Install pin **OR** post, **as directed**, type, except install suspension type at corners, angles, dead ends, and other locations where horizontal forces exceed rated values for pin or line-post-type units.
 - a. Install suspension insulators and hardware that have mechanical strength exceeding rated breaking strength of attached conductors.
 - b. Install horizontal line-post insulators for armless construction.
2. Post-Insulator Conductor Support: Where installed horizontally and for line angles more than 15 degrees, install clamp-top conductor clamps.
3. Install spool-type insulators for secondary lines mounted on clevis attachments or secondary racks.
4. Guy Strain Type: Install porcelain **OR** fiberglass-reinforced, **as directed**, units.

I. Surge Arresters

1. Install surge arresters to protect distribution **OR** metering equipment **OR** reclosers, **as directed**, group-operated, load-interrupter switches, **as directed**, aerial-to-underground transitions, **as directed**, and other items indicated.
 - a. Units Installed **6000 Feet (1800 m)** or More above Sea Level: Use arresters specifically rated for this service.

J. Cutout, Switch, And Fuse Installation

1. Hook-Stick-Operated Switches: Install to maximize safe operating access.

2. Group-Operated, Load-Interrupter Switches and Air-Break Switches: Install operating handle **42 inches (1067 mm)** above finished grade.
 - a. Locking Provisions: Install padlock at hasp.
- K. Metering Component Installation
 1. Current and Voltage Transformers: Install secondary conductors between transformers and cabinet in sleeves made of galvanized rigid steel **OR** intermediate metal **OR** PVC, **as directed**, conduit. Install to prevent collection of moisture in raceway and cabinet system.
 2. Meter Cabinet: Mount on pole, **72 inches (1825 mm)** above finished grade to center of cabinet.
 - a. Make conduit connections with raintight hubs.
 - b. Install metering transformer secondary leads without splices. Train leads at sides and bottom of enclosure, and secure with wire ties.
 - c. Install meter and meter test block within cabinet.
 - d. Install identical phase sequence, and color-code for both potential and current leads.
 - e. Identify leads using designations consistent with marking on transformer terminals.
- L. Field Quality Control
 1. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
 2. Perform tests and inspections.
 3. Tests and Inspections:
 - a. Furnish instruments and equipment required for tests that comply with NETA Acceptance Testing Specification.
 - b. Guy Anchors: Test one of each type and capacity installed, plus additional units specifically indicated for testing, **as directed**. Apply rated pull-out force in the same pull direction applied by the guy at the test location.
 - 1) Acceptable Test Results: Denoted by movement of less than **3/8 inch (10 mm)** by the holding component of the anchor in the earth or other medium in which it is installed.
 - 2) Replace or reinstall, at the Owner 's option, all anchors of same type and capacity as anchor type that fails this test.
 - c. Ground Resistance: Comply with Division 26 Section "Grounding And Bonding For Electrical Systems". Measure resistance of each separate grounding electrode, including pole grounds. Also measure resistance of separate grounding electrode systems before bonding together.
 - 1) Perform tests and obtain acceptable results before energizing any portion of overhead electrical distribution system.
 - 2) Results and Follow-up: If ground resistance for a single ground electrode or pole ground, tested individually, exceeds 25 ohms, add a ground electrode not less than **10 feet (3 m)** away and interconnect with No. 2 AWG, minimum, bare conductor buried at least **12 inches (300 mm)** below furnished grade.
 - d. Aerial Conductor Sag and Tension: Observe procedures used by Contractor to verify that initial stringing sags and tensions comply with IEEE C2 and conductor manufacturer's product data and written recommendations.
 - e. Self-Supported, Medium-Voltage Cable: After installation, while cable is isolated, and after terminations are installed and before connecting or energizing, apply dc voltage between each phase conductor and grounding connections of sheath or metallic shield. Comply with NEMA WC 70/ICEA S-95-658 for method, voltage, duration, pass-fail performance, and other test criteria. Perform other field inspections and tests recommended by manufacturer.
 - f. Neutral-Supported, Secondary Service-Drop Cable: Test for insulation resistance while cable is isolated, before connecting or energizing. Minimum acceptable resistance is 100 megohms.
 - g. Existing Surge Arresters: Disconnect and measure resistance between line and ground terminals with a megger test rated 600 V or more. Acceptable resistance values are 300 megohms and more.

02 - Existing Conditions

- h. New Surge Arresters, Cutouts, and Switches: Inspect after installation and connection to wiring. Verify that ratings and characteristics match approved submittals and comply with system requirements. Verify that installation complies with requirements and that clearances of units and connecting wiring comply with IEEE C2 requirements.
 - 1) Verify proper grounding of metallic equipment parts.
 - 2) Fuses and Disconnect Links: Verify that ratings and characteristics match submittals and comply with system requirements.
 - 3) Switches:
 - a) Manually operate each cutout and switch at least three times, to verify proper operation.
 - b) Verify correct contact alignment, blade penetration, travel stops, and arc interrupter operation.
 - 4) Group-Operated, Load-Interrupter Switches and Air-Break Switches:
 - a) Perform mechanical operator tests according to manufacturer's written instructions.
 - b) Test resistance to ground of parts to be energized. Acceptable value is 200,000 megohms.
 - c) Perform contact-resistance test across all switch blade contacts. Refer to manufacturer's data for acceptable contact resistance.
 - 5) Verify that clearances of energized parts and connecting wires comply with IEEE C2 requirements.
 - i. Distribution Transformers: Inspect after installation and connection to wiring and verify that ratings and characteristics match approved submittals and comply with system requirements. Verify the integrity and good condition of unit.
 - 1) Inspect for physical damage, cracked insulators, leaks, tightness of connections, and overall mechanical and electrical integrity.
 - 2) Perform preenergizing inspections and tests recommended by manufacturer.
 - 3) Verify proper equipment grounding.
 - 4) Verify that clearances of terminals and connecting wires comply with IEEE C2.
 - j. Metering Transformers: Inspect after installation and connection to wires, and verify that ratings and characteristics match approved submittals and comply with system requirements. Verify the integrity and good condition of unit.
 - 1) Verify proper connections, tightness of bolted connections, and integrity of mounting provisions.
 - 2) Verify that required grounding and shorting connections provide good contact.
 - 3) Verify that clearances of terminals and connecting wires comply with IEEE C2.
 - 4) Perform electrical tests according to manufacturer's written instructions, including insulation-resistance tests, polarity tests, and turns-ratio and ratio-verification tests.
 - k. Meters: Inspect after installation and connection to wiring and verify that ratings and characteristics match approved submittals and comply with system requirements. Verify the integrity and good condition of unit.
 - 1) Verify tightness of electrical connections.
 - 2) Verify accuracy at 25, 50, 75, and 100 percent of full-rated load and verify all instrument multipliers according to manufacturer's written instructions.
4. Prepare test and inspection reports.
- M. Adjusting
- 1. Distribution Transformers: Set voltage taps as directed by the Owner.
- N. Cleaning
- 1. After completing equipment installation, inspect equipment. Remove spots, dirt, and debris. Repair damaged finish to match original finish. For distribution transformer, use tank touchup paint provided by manufacturer.
 - a. Clean enclosures internally, on completion of installation, according to manufacturer's written instructions.

- O. Demonstration
 - 1. Train Owner's maintenance personnel to adjust, operate, and maintain overhead electrical distribution.

END OF SECTION 02 84 33 00

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 02 87 13 33 - MOLD REMEDIATION

1.1 GENERAL

A. Description Of Work

1. This specification covers the removal and disposal of mold. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. List of all personnel to be involved in the work with their training and certifications.
2. List of all products and procedures proposed for use in performance of the work.
3. Test reports.
4. Certificates.

C. References

1. U.S. EPA "Mold Remediation in Schools and Commercial Buildings"
2. U.S. EPA "A Brief Guide to Mold, Moisture, and Your Home"

D. Quality Assurance

1. Conform to all Federal, State, and Local regulations which govern the handling and disposal of mold materials.

1.2 PRODUCT - (Not Used)

1.3 EXECUTION

- A. Environmental Assessment: The presence of mold, water damage, or musty odors shall be addressed immediately. In all instances, any source(s) of water must be stopped and the extent of water damaged determined. Water damaged materials shall be dried and repaired. Mold damaged materials shall be remediated in accordance with this document.

1. Visual Inspection: A visual inspection is the most important initial step in identifying a possible contamination problem. The extent of any water damage and mold growth shall be visually assessed. This assessment is important in determining remedial strategies. Ventilation systems shall also be visually checked, particularly for damp filters but also for damp conditions elsewhere in the system and overall cleanliness. Ceiling tiles, gypsum wallboard (sheetrock), cardboard, paper, and other cellulosic surfaces shall be given careful attention during a visual inspection. The use of equipment such as a boroscope, to view spaces in ductwork or behind walls, or a moisture meter, to detect moisture in building materials, may be helpful in identifying hidden sources of fungal growth and the extent of water damage.
2. Bulk/Surface Sampling
 - a. Bulk or surface sampling is not required to undertake a remediation. Remediation of visually identified fungal contamination shall proceed without further evaluation.
 - b. Bulk or surface samples may need to be collected to identify specific fungal contaminants as part of a medical evaluation if occupants are experiencing symptoms which may be related to fungal exposure or to identify the presence or absence of mold if a visual inspection is equivocal (e.g., discoloration, and staining).
 - c. An individual trained in appropriate sampling methodology shall perform bulk or surface sampling. Bulk samples shall be collected from visibly moldy surfaces by scraping or cutting materials with a clean tool into a clean plastic bag. Surface samples shall be collected by wiping a measured area with a sterile swab or by stripping the suspect surface

02 - Existing Conditions

with clear tape. Surface sampling is less destructive than bulk sampling. Other sampling methods may also be available. A laboratory specializing in mycology shall be consulted for specific sampling and delivery instructions.

3. Air Monitoring
 - a. Air sampling for fungi shall not be part of a routine assessment. This is because decisions about appropriate remediation strategies can usually be made on the basis of a visual inspection. In addition, air-sampling methods for some fungi are prone to false negative results and therefore cannot be used to definitively rule out contamination.
 - b. Air monitoring may be necessary if an individual(s) has been diagnosed with a disease that is or may be associated with a fungal exposure (e.g., pulmonary hemorrhage/hemosiderosis, and aspergillosis).
 - c. Air monitoring may be necessary if there is evidence from a visual inspection or bulk sampling that ventilation systems may be contaminated. The purpose of such air monitoring is to assess the extent of contamination throughout a building. It is preferable to conduct sampling while ventilation systems are operating.
 - d. Air monitoring may be necessary if the presence of mold is suspected (e.g., musty odors) but cannot be identified by a visual inspection or bulk sampling (e.g., mold growth behind walls). The purpose of such air monitoring is to determine the location and/or extent of contamination.
 - e. If air monitoring is performed, for comparative purposes, outdoor air samples shall be collected concurrently at an air intake, if possible, and at a location representative of outdoor air. For additional information on air sampling, refer to the American Conference of Governmental Industrial Hygienists' document, "Bioaerosols: Assessment and Control."
 - f. Personnel conducting the sampling shall be trained in proper air sampling methods for microbial contaminants. A laboratory specializing in mycology shall be consulted for specific sampling and shipping instructions.
4. Analysis of Environmental Samples
 - a. Microscopic identification of the spores/colonies requires considerable expertise. These services are not routinely available from commercial laboratories. Documented quality control in the laboratories used for analysis of the bulk/surface and air samples is necessary. The American Industrial Hygiene Association (AIHA) offers accreditation to microbial laboratories (Environmental Microbiology Laboratory Accreditation Program (EMLAP)). Accredited laboratories must participate in quarterly proficiency testing (Environmental Microbiology Proficiency Analytical Testing Program (EMPAT)).
5. Evaluation of bulk/surface and air sampling data shall be performed by an experienced health professional. The presence of few or trace amounts of fungal spores in bulk/surface sampling shall be considered background. Amounts greater than this or the presence of fungal fragments (e.g., hyphae, and conidiophores) may suggest fungal colonization, growth, and/or accumulation at or near the sampled location. Air samples shall be evaluated by means of comparison (i.e., indoors to outdoors) and by fungal type (e.g., genera, and species). In general, the levels and types of fungi found should be similar indoors (in non-problem buildings) as compared to the outdoor air. Differences in the levels or types of fungi found in air samples may indicate that moisture sources and resultant fungal growth may be problematic.

B. Remediation

1. General
 - a. **In all situations, the underlying cause of water accumulation must be rectified or fungal growth will recur.** Any initial water infiltration shall be stopped and cleaned immediately. An immediate response (within 24 to 48 hours) and thorough clean up, drying, and/or removal of water damaged materials will prevent or limit mold growth. If the source of water is elevated humidity, relative humidity shall be maintained at levels below 60% to inhibit mold growth. Emphasis shall be on ensuring proper repairs of the building infrastructure, so that water damage and moisture buildup does not recur.
 - b. Five different levels of abatement are described below. The size of the area impacted by fungal contamination primarily determines the type of remediation. The sizing levels below

are based on professional judgment and practicality; currently there is not adequate data to relate the extent of contamination to frequency or severity of health effects. **The goal of remediation is to remove or clean contaminated materials in a way that prevents the emission of fungi and dust contaminated with fungi from leaving a work area and entering an occupied or non-abatement area, while protecting the health of workers performing the abatement.** The listed remediation methods were designed to achieve this goal, however, due to the general nature of these methods it is the responsibility of the people conducting remediation to ensure the methods enacted are adequate. The listed remediation methods are not meant to exclude other similarly effective methods. Any changes to the remediation methods listed in these guidelines, however, shall be carefully considered prior to implementation.

- c. Non-porous (e.g., metals, glass, and hard plastics) and semi-porous (e.g., wood, and concrete) materials that are structurally sound and are visibly moldy can be cleaned and reused. Cleaning shall be done using a detergent solution. Porous materials such as ceiling tiles and insulation, and wallboards with more than a small area of contamination shall be removed and discarded. Porous materials (e.g., wallboard, and fabrics) that can be cleaned, can be reused, but should be discarded if possible. A professional restoration consultant shall be contacted when restoring porous materials with more than a small area of fungal contamination. All materials to be reused shall be dry and visibly free from mold. Routine inspections shall be conducted to confirm the effectiveness of remediation work.
 - d. The use of gaseous, vapor-phase, or aerosolized biocides for remedial purposes is **not** recommended. The use of biocides in this manner can pose health concerns for people in occupied spaces of the building and for people returning to the treated space if used improperly. Furthermore, the effectiveness of these treatments is unproven and does not address the possible health concerns from the presence of the remaining non-viable mold. For additional information on the use of biocides for remedial purposes, refer to the American Conference of Governmental Industrial Hygienists' document, "Bioaerosols: Assessment and Control."
2. **Level I: Small Isolated Areas** (10 sq. ft or less) - e.g., ceiling tiles, small areas on walls
 - a. Remediation can be conducted by regular building maintenance staff. Such persons shall receive training on proper clean up methods, personal protection, and potential health hazards. This training can be performed as part of a program to comply with the requirements of the OSHA Hazard Communication Standard (29 CFR 1910.1200).
 - b. Respiratory protection (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended. Gloves and eye protection shall be worn.
 - c. The work area shall be unoccupied. Vacating people from spaces adjacent to the work area is not necessary but is recommended in the presence of infants (less than 12 months old), persons recovering from recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity, pneumonitis, and severe allergies).
 - d. Containment of the work area is not necessary. Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.
 - e. Contaminated materials that cannot be cleaned shall be removed from the building in a sealed plastic bag. There are no special requirements for the disposal of moldy materials.
 - f. The work area and areas used by remedial workers for egress shall be cleaned with a damp cloth and/or mop and a detergent solution.
 - g. All areas shall be left dry and visibly free from contamination and debris.
 3. **Level II: Mid-Sized Isolated Areas** (10 - 30 sq. ft.) - e.g., individual wallboard panels.
 - a. Remediation can be conducted by regular building maintenance staff. Such persons shall receive training on proper clean up methods, personal protection, and potential health hazards. This training can be performed as part of a program to comply with the requirements of the OSHA Hazard Communication Standard (29 CFR 1910.1200).
 - b. Respiratory protection (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended. Gloves and eye protection shall be worn.

- c. The work area shall be unoccupied. Vacating people from spaces adjacent to the work area is not necessary but is recommended in the presence of infants (less than 12 months old), persons having undergone recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity, pneumonitis, and severe allergies).
- d. The work area shall be covered with a plastic sheet(s) and sealed with tape before remediation, to contain dust/debris.
- e. Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.
- f. Contaminated materials that cannot be cleaned shall be removed from the building in sealed plastic bags. There are no special requirements for the disposal of moldy materials.
- g. The work area and areas used by remedial workers for egress shall be HEPA vacuumed (a vacuum equipped with a High-Efficiency Particulate Air filter) and cleaned with a damp cloth and/or mop and a detergent solution.
- h. All areas shall be left dry and visibly free from contamination and debris.
- 4. **Level III: Large Isolated Areas** (30 - 100 square feet) - e.g., several wallboard panels.
 - a. A health and safety professional with experience performing microbial investigations shall be consulted prior to remediation activities to provide oversight for the project.
 - b. The following procedures *at a minimum* are recommended:
 - 1) Personnel trained in the handling of hazardous materials and equipped with respiratory protection, (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended. Gloves and eye protection shall be worn.
 - 2) The work area and areas directly adjacent shall be covered with a plastic sheet(s) and taped before remediation, to contain dust/debris.
 - 3) Seal ventilation ducts/grills in the work area and areas directly adjacent with plastic sheeting.
 - 4) The work area and areas directly adjacent shall be unoccupied. Further vacating of people from spaces near the work area is recommended in the presence of infants (less than 12 months old), persons having undergone recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity, pneumonitis, and severe allergies).
 - 5) Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.
 - 6) Contaminated materials that cannot be cleaned shall be removed from the building in sealed plastic bags. There are no special requirements for the disposal of moldy materials.
 - 7) The work area and surrounding areas shall be HEPA vacuumed and cleaned with a damp cloth and/or mop and a detergent solution.
 - 8) All areas shall be left dry and visibly free from contamination and debris.
 - c. If abatement procedures are expected to generate a lot of dust (e.g., abrasive cleaning of contaminated surfaces, demolition of plaster walls) or the visible concentration of the fungi is heavy (blanket coverage as opposed to patchy), then it is recommended that the remediation procedures for Level IV are followed.
- 5. **Level IV: Extensive Contamination** (greater than 100 contiguous square feet in an area)
 - a. A health and safety professional with experience performing microbial investigations shall be consulted prior to remediation activities to provide oversight for the project. The following procedures are recommended:
 - 1) Personnel trained in the handling of hazardous materials equipped with:
 - a) Full-face respirators with high efficiency particulate air (HEPA) cartridges
 - b) Disposable protective clothing covering both head and shoes
 - c) Gloves
 - 2) Containment of the affected area:

- a) Complete isolation of work area from occupied spaces using plastic sheeting sealed with duct tape (including ventilation ducts/grills, fixtures, and any other openings)
 - b) The use of an exhaust fan with a HEPA filter to generate negative pressurization
 - c) Airlocks and decontamination room
 - 3) Vacating people from spaces adjacent to the work area is not necessary but is recommended in the presence of infants (less than 12 months old), persons having undergone recent surgery, immune suppressed people, or people with chronic inflammatory lung diseases (e.g., asthma, hypersensitivity, pneumonitis, and severe allergies).
 - 4) Contaminated materials that cannot be cleaned shall be removed from the building in sealed plastic bags. The outside of the bags shall be cleaned with a damp cloth and a detergent solution or HEPA vacuumed in the decontamination chamber prior to their transport to uncontaminated areas of the building. There are no special requirements for the disposal of moldy materials.
 - 5) The contained area and decontamination room shall be HEPA vacuumed and cleaned with a damp cloth and/or mop with a detergent solution and be visibly clean prior to the removal of isolation barriers.
 - 6) Air monitoring shall be conducted prior to occupancy to determine if the area is fit to reoccupy.
6. **Level V: Remediation of HVAC Systems**
- a. A Small Isolated Area of Contamination (<10 square feet) in the HVAC System
 - 1) Remediation can be conducted by regular building maintenance staff. Such persons shall receive training on proper clean up methods, personal protection, and potential health hazards. This training can be performed as part of a program to comply with the requirements of the OSHA Hazard Communication Standard (29 CFR 1910.1200).
 - 2) Respiratory protection (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended. Gloves and eye protection shall be worn.
 - 3) The HVAC system shall be shut down prior to any remedial activities.
 - 4) The work area shall be covered with a plastic sheet(s) and sealed with tape before remediation, to contain dust/debris.
 - 5) Dust suppression methods, such as misting (not soaking) surfaces prior to remediation, are recommended.
 - 6) Growth supporting materials that are contaminated, such as the paper on the insulation of interior lined ducts and filters, shall be removed. Other contaminated materials that cannot be cleaned shall be removed in sealed plastic bags. There are no special requirements for the disposal of moldy materials.
 - 7) The work area and areas immediately surrounding the work area shall be HEPA vacuumed and cleaned with a damp cloth and/or mop and a detergent solution.
 - 8) All areas shall be left dry and visibly free from contamination and debris.
 - 9) A variety of biocides are recommended by HVAC manufacturers for use with HVAC components, such as, cooling coils and condensation pans. HVAC manufacturers shall be consulted for the products they recommend for use in their systems.
 - b. Areas of Contamination (>10 square feet) in the HVAC System: A health and safety professional with experience performing microbial investigations shall be consulted prior to remediation activities to provide oversight for remediation projects involving more than a small isolated area in an HVAC system. The following procedures are recommended:
 - 1) Personnel trained in the handling of hazardous materials equipped with:
 - a) Respiratory protection (e.g., N95 disposable respirator), in accordance with the OSHA respiratory protection standard (29 CFR 1910.134), is recommended.
 - b) Gloves and eye protection

02 - Existing Conditions

- c) Full-face respirators with HEPA cartridges and disposable protective clothing covering both head and shoes shall be worn if contamination is greater than 30 square feet.
 - 2) The HVAC system shall be shut down prior to any remedial activities.
 - 3) Containment of the affected area:
 - a) Complete isolation of work area from the other areas of the HVAC system using plastic sheeting sealed with duct tape.
 - b) The use of an exhaust fan with a HEPA filter to generate negative pressurization.
 - c) Airlocks and decontamination room if contamination is greater than 30 square feet.
 - 4) Growth supporting materials that are contaminated, such as the paper on the insulation of interior lined ducts and filters, shall be removed. Other contaminated materials that cannot be cleaned should be removed in sealed plastic bags. When a decontamination chamber is present, the outside of the bags shall be cleaned with a damp cloth and a detergent solution or HEPA vacuumed prior to their transport to uncontaminated areas of the building. There are no special requirements for the disposal of moldy materials.
 - 5) The contained area and decontamination room shall be HEPA vacuumed and cleaned with a damp cloth and/or mop and a detergent solution prior to the removal of isolation barriers.
 - 6) All areas shall be left dry and visibly free from contamination and debris.
 - 7) Air monitoring shall be conducted prior to re-occupancy with the HVAC system in operation to determine if the area(s) served by the system are fit to reoccupy.
 - 8) A variety of biocides are recommended by HVAC manufacturers for use with HVAC components, such as, cooling coils and condensation pans. HVAC manufacturers shall be consulted for the products they recommend for use in their systems.
7. Hazard Communication: When fungal growth requiring large-scale remediation is found, the building owner, management, and/or employer shall notify occupants in the affected area(s) of its presence. Notification shall include a description of the remedial measures to be taken and a timetable for completion. Group meetings held before and after remediation with full disclosure of plans and results can be an effective communication mechanism. Individuals with persistent health problems that appear to be related to bioaerosol exposure should see their physicians for a referral to practitioners who are trained in occupational/environmental medicine or related specialties and are knowledgeable about these types of exposures. Individuals seeking medical attention shall be provided with a copy of all inspection results and interpretation to give to their medical practitioners.

END OF SECTION 02 87 13 33

SECTION 02 87 16 13 - EXCREMENT REMOVAL

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for bird and bird waste abatement. Products shall be as follows or as directed by the the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary Of Work

1. Work Included - Conventional Enclosure for Removal of Birds and Bird Waste
 - a. Seal off penetrations on perimeter walls into the work area (critical barriers) and establish a decontamination facility for workers.
 - b. Coordinate activities with the demolition and well capping activities.
2. Work Included - Removal and disposal of birds and bird waste.
 - a. Establish work area by installing construction barrier tape around removal area.
 - b. Remove and properly dispose of bulk contamination debris.
 - c. Mist bird waste and contaminated material with Biocide or the equivalent (i.e. Sanogene, Oxine, or Envirocon).
 - d. Remove and properly dispose of contaminated waste material from all building components.
 - e. Utilize low pressure washers or scrub brushes to clean all wall surfaces of bird waste.

C. Quality Criteria

1. Qualifications for Performance of Work
 - a. Contractor (or subcontractor engaged to perform the Work of this Section) shall:
 - 1) Be a licensed bird waste abatement contractor in accordance with the Statutes of the State in which the work is to be performed. Submit notarized documentation confirming current licensure.
 - 2) Have a record of not less than five years successful experience in bird waste removal or asbestos removal.
2. Reference Standards
 - a. Acknowledge, by the executing of the Contract, awareness and familiarity with the contents and requirements of the following regulations, codes, and standards, and assume responsibility for the performance of the Work in strict compliance therewith and for every instance of failure to comply therewith.
 - b. Where conflict among requirements or with the Contract Documents exists, the more stringent requirements shall apply.
 - 1) USEPA Regional National Emissions Standards for Hazardous Air Pollutants (NESHAPS)
 - 2) U.S. Occupational and Safety and Health Administration (OSHA)
 - 3) U.S. EPA Office of Pesticide and Toxic Substances Guidance Document
 - 4) U.S. Department of Transportation, Hazardous Substances: Final Rule (49 CFR 171 and 172), Federal Register November 21, 1986 and corrected February 17, 1987.
 - 5) Statutes of the State in which the Work is to be Performed: Licensure for Asbestos Consultants and Contractors.
 - 6) All state, county, and city codes and ordinances as applicable. Make available for review at the site one copy of EPA, OSHA, and applicable State, County, and City Regulations governing the Work.
3. Patent/Copyright Compliance: Contractor shall determine the applicability of any process patents that may be employed and shall be responsible for the payment of all fees, royalties and licenses that may be required for the use of any patented or licensed process. Contractor shall hold the Owner, Engineer and Testing Laboratory harmless for failure to obtain any licenses and to pay any applicable fees and royalties.

02 - Existing Conditions

- D. Product Handling
1. Deliver all materials in the original packages, containers, or bundles bearing the name of the manufacturer and the brand name.
 2. Store all materials subject to damage off the ground, away from wet or damp surfaces, and under cover sufficient to prevent damage or contamination.
 3. Remove from the premises all damaged or deteriorating materials. Dispose of materials that become contaminated with waste in accordance with applicable regulatory standards.
- E. Worksite Conditions
1. Worker and Visitor Procedures: The Contractor is hereby advised that the birds and bird wastes have been determined to cause diseases by inhalation and Contractor shall provide workers and qualified visitors with respirators that, as a minimum, shall meet the requirements of current applicable OSHA regulations, and protective clothing during preparation of system of enclosures, prior to commencing, during actual removal, and until final clean-up is completed. Also all personnel assigned to work on this project shall attend a training/awareness class for the purpose of explaining the hazards of improperly handling these materials and proper control measures to take in order to protect themselves.
- F. Personnel Protection
1. General
 - a. Provide respiratory protection in accordance with OSHA regulations 29 CFR 1910-134 and in accordance with the following paragraphs.
 - 1) Prior to commencement of work, all workers shall be instructed by the Contractor and shall be knowledgeable in the appropriate procedures of personnel protection and waste removal.
 - 2) Where respirators with disposable filters are used, provide sufficient filters for replacement as necessary by the workers, or as required by applicable regulations.
 - 3) Permit no visitors, except for governmental inspectors having jurisdiction, or as authorized by Engineer or the Owner, in the work areas after commencement of waste disturbance or removal. Provide authorized visitors with suitable respirators.
 - 4) Provide workers with sufficient sets of protective disposable clothing, consisting of full-body coveralls, head covers, gloves, and foot covers, of sizes to properly fit individual workers.
 - 5) Provide authorized visitors with a set of suitable protective disposable clothing, headgear, eye protection, and/or footwear of sizes to properly fit visitors whenever they are required to enter the work area, to a maximum of six sets per day.
 - 6) Provide, in addition to respirators and protective clothing provided for authorized visitors, protective clothing and respirators for use by Testing Laboratory's representative. Furnish protective clothing in as many sets as required for full-time monitoring by Testing Laboratory.
 - 7) Provide and post the decontamination and work procedures to be followed by workers.
 2. Respiratory Protection Program
 - a. Maintain a respiratory protection program that contains all the elements of the OSHA regulations. Provide a copy to the Engineer for approval.
 - b. Appoint a respiratory protection program administrator, who shall be responsible for the program, maintaining all documentation, instructing workers and providing fit tests. Respiratory protection administrator is to be qualified under OSHA requirements and to have attended and passed, as a minimum, OSHA training institute 2-week course on respiratory protection or NIOSH course "Occupational Respiratory Protection." Respiratory protection program administrator is to be on-site daily during abatement activities. All written programs and directions are to be in English and/or the language of the abatement workers if they are not fluent in English.
 - c. The Contractor is advised that the minimum respiratory requirements as called for in this section and on any drawings/sketches shall be applied unless reported measures indicate

that a lower form of respiratory protection is acceptable according to the appropriate OSHA regulations and the more strict sections of the specification.

3. Respiratory Protection Requirements
 - a. Workers shall be provided with respiratory protection equipment. The respirators are to be sanitized and maintained in accordance with the manufacturer's specification. Appropriate respirator selection will be dependent upon the work to be performed and the level of exposure, as given below.
 - b. For the clean-up, as a minimum, the use of full-faced air-purifying respirators is required for all preparation, removal and cleaning work.
 - c. This specification requires that workers shall wear suitable respiratory protection at all times whenever a potential for exposure to bird and bird waste exists.

1.2 PRODUCTS

A. Materials

1. Polyethylene/Plastic sheeting shall be of the thicknesses specified, not less than 6 mil, in sizes to minimize the frequency of joints. Utilize reinforced plastic sheeting in specified thicknesses on floors.
2. Tape shall be glass fiber or other type capable of sealing joints of adjacent sheets of plastic and for attachment of plastic sheet to finished or unfinished surfaces of dissimilar materials under both dry and wet conditions.
3. Sodium Hypochlorite ("bleach")
4. Impermeable Containers shall be suitable to receive and retain contaminated materials until disposal at an approved site and shall be labeled in accordance with U.S. DOT 49 CFR 171 and 172, and containers shall be both air- and water-tight. Use a minimum of two types of impermeable containers: 1) six millimeter-thick (mil) plastic bags sized to fit within the drum; and 2) metal or fiber drums with tightly fitting lids.
5. Other Materials: Provide all other materials, such as lumber, nails, and hardware, that may be required to construct and dismantle the decontamination area and the barriers that isolate the work area(s).
6. Caulking shall be non-shrinking caulk to be used where insulated pipes continue through areas such as walls and ceilings. Contractor shall determine and submit proof that caulk proposed for use is compatible with the temperature conditions of the surfaces to which it is to be applied.
 - a. Tools And Equipment
 - 1) Water Sprayer - utilize airless or other low pressure sprayer for amended water application.
 - 2) Air Purifying Equipment (for internal recirculation in the work area) shall be HEPA Filtration Systems or Electronic Precipitators. Ensure that no internal air movement system or purification equipment exhausts contaminated air from the work area(s) outside the work area.
 - 3) Diminished Air Pressure Equipment shall comply with ANSI 29.2-7, local exhaust ventilation.
 - 4) Scaffolding shall be as required to accomplish the specified work and shall meet all applicable safety regulations.
 - 5) Transportation - as required for loading, temporary storage, transit, and unloading of contaminated waste without exposure to persons or property.

1.3 EXECUTION

A. Procedures

1. All personnel assigned to perform the work shall attend a training/awareness class for the purpose of explaining the hazards of improperly handling the waste and the proper control measures to take in order to protect themselves. These work procedures shall be discussed with

02 - Existing Conditions

- each individual followed by the individual acknowledging receipt of this training by completing the pertinent information on a Hazardous Awareness Training Form
2. The majority of diseases related to bird waste is related to the inhalation of the airborne dust released by the waste. All personnel performing removal/decontamination waste shall therefore wear Powered Air Purifying Respirators (PAPR) equipped with combination Organic Vapor and High Efficiency Particulate Air (HEPA) filters while handling the waste.
 3. Workers shall wear non-porous gloves and boots during all preparatory and removal operations.
 4. When entering the building, the removal/decontamination personnel shall mist all surfaces having visible remnants of waste, using a diluted sodium hypochlorite ("bleach") and water solution. This solution shall be diluted at a ratio of 10 parts water to 1 part bleach for a 10 to 1 ration (10:1). The waste shall be continuously misted during occupancy in order to keep airborne dust emissions from the waste to a minimum.
 5. Remove all birds from the building and seal all openings into the building. The main purpose of this is to eliminate the availability for future bird access into the building. The openings may be temporarily sealed or closed up in many ways, including boarding up windows/doors, polyethylene sheeting, or other convenient and cost effective means. It is not the intention of this task to completely seal the building airtight.
 6. Designate an area of the facility for the purpose of storing the waste prior to loading for transportation to the appropriate landfill. The area designated shall have easy access to the door which will be utilized as the waste load-out.

SECTION 03 01 30 71 - MAINTENANCE OF CAST-IN-PLACE CONCRETE

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for concrete rehabilitation. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Removal of deteriorated concrete and reinforcement and subsequent replacement and patching.
 - b. Floor joint repair.
 - c. Epoxy crack injection.
 - d. Corrosion-inhibiting treatment.
 - e. Polymer overlays.
 - f. Polymer sealers.
 - g. Steel structural reinforcement.
 - h. Composite structural reinforcement.

C. Submittals

1. Product Data: For each type of product indicated. Include material descriptions, chemical composition, physical properties, test data, and mixing, preparation, and application instructions.
2. Formwork and Shoring Drawings: Prepared by or under the supervision of a qualified professional engineer detailing formwork and temporary shoring and supports. Include schedule and sequence for erection and removal relative to removal of deteriorated concrete and reinforcement and subsequent repair and reinforcement.
3. Samples: Cured Samples of overlay and patching materials.
4. Rehabilitation Program: For each phase of rehabilitation process, including protection of surrounding materials and Project site during operations. Describe in detail materials, methods, equipment, and sequence of operations to be used for each phase of the Work.
 - a. If alternative materials and methods to those indicated are proposed for any phase of rehabilitation work, submit substitution request and provide a written description of proposed materials and methods, including evidence of successful use on other comparable projects, and a testing program to demonstrate their effectiveness for this Project.

D. Delivery, Storage, And Handling

1. Deliver materials to Project site in manufacturer's original and unopened containers, labeled with type and name of products and manufacturers.
2. Comply with manufacturer's written instructions for minimum and maximum temperature requirements and other conditions for storage.
3. Store cementitious materials off the ground, under cover, and in a dry location.
4. Store aggregates, covered and in a dry location, where grading and other required characteristics can be maintained and contamination avoided.

E. Project Conditions

1. Environmental Limitations for Epoxies: Do not apply when air and substrate temperatures are outside limits permitted by manufacturer. During hot weather, cool epoxy components before mixing, store mixed products in shade, and cool unused mixed products to retard setting. Do not apply to wet substrates unless approved by manufacturer.

- a. Use only Class A epoxies when substrate temperatures are below or are expected to go below **40 deg F (5 deg C)** within 8 hours.
 - b. Use only Class A or B epoxies when substrate temperatures are below or are expected to go below **60 deg F (16 deg C)** within 8 hours.
 - c. Use only Class C epoxies when substrate temperatures are above and are expected to stay above **60 deg F (16 deg C)** for 8 hours.
2. Cold-Weather Requirements for Cementitious Materials:
- a. Do not apply unless air temperature is above **40 deg F (5 deg C)** and will remain so for at least 48 hours after completion of Work.
OR
Comply with the following procedures:
 - 1) When air temperature is below **40 deg F (5 deg C)**, heat patching material ingredients and existing concrete to produce temperatures between **40 and 90 deg F (5 and 32 deg C)**.
 - 2) When mean daily air temperature is between **25 and 40 deg F (minus 4 and plus 5 deg C)**, cover completed Work with weather-resistant insulating blankets for 48 hours after repair or provide enclosure and heat to maintain temperatures above **32 deg F (0 deg C)** within the enclosure for 48 hours after repair.
 - 3) When mean daily air temperature is below **25 deg F (minus 4 deg C)**, provide enclosure and heat to maintain temperatures above **32 deg F (0 deg C)** within the enclosure for 48 hours after repair.
3. Hot-Weather Requirements for Cementitious Materials: Protect repair work when temperature and humidity conditions produce excessive evaporation of water from patching materials. Provide artificial shade and wind breaks, and use cooled materials as required. Do not apply to substrates with temperatures of **90 deg F (32 deg C)** and above.
4. Environmental Limitations for High-Molecular-Weight Methacrylate Sealers: Do not apply when concrete surface temperature is below **55 deg F (13 deg C)** or above **75 deg F (24 deg C) OR 90 deg F (32 deg C)**, **as directed**. Apply only to dry substrates **OR** substrates that have been dry for at least 72 hours.

1.2 PRODUCTS

A. Bonding Agents

1. Epoxy-Modified, Cementitious Bonding and Anticorrosion Agent: Product that consists of water-insensitive epoxy adhesive, portland cement, and water-based solution of corrosion-inhibiting chemicals that forms a protective film on steel reinforcement.
2. Epoxy Bonding Agent: ASTM C 881/C 881M, Type II **OR** V, **as directed**.
 - a. Thin Film Open Time: Not less than two **OR** six **OR** 24, **as directed**, hours.
3. Latex Bonding Agent: ASTM C 1059, Type I **OR** II **OR** II at exterior locations and where indicated, Type I at other locations, **as directed**.
4. Mortar Scrub-Coat: 1 part portland cement complying with ASTM C 150, Type I, II, or III and 1 part fine aggregate complying with ASTM C 144, except 100 percent passing a **No. 16 (1.18-mm)** sieve.

B. Patching Mortar

1. Patching Mortar, General:
 - a. Overhead Patching Mortar: For overhead repairs, use patching mortar recommended by manufacturer for overhead use and as specified in this Article.
 - b. Coarse Aggregate for Adding to Patching Mortar: Washed aggregate complying with ASTM C 33, Size No. 8, Class 5S. Add only as permitted by patching mortar manufacturer.
2. Job-Mixed Patching Mortar: 1 part portland cement complying with ASTM C 150, Type I, II, or III and 2-1/2 parts fine aggregate complying with ASTM C 144, except 100 percent passing a **No. 16 (1.18-mm)** sieve.

3. Cementitious Patching Mortar: Packaged, dry mix complying with ASTM C 928.
 4. Polymer-Modified, Cementitious Patching Mortar: Packaged, dry mix complying with ASTM C 928, that contains a non-redispersible latex additive as either a dry powder or a separate liquid that is added during mixing.
 5. Polymer-Modified, Silica-Fume-Enhanced, Cementitious Patching Mortar: Packaged, dry mix complying with ASTM C 928, that contains silica fume complying with ASTM C 1240 and a non-redispersible latex additive as either a dry powder or a separate liquid that is added during mixing.
- C. Concrete
1. Concrete Materials and Admixtures: Comply with Division 03 Section "Cast-in-place Concrete".
 2. Steel and Fiber Reinforcement and Reinforcement Accessories: Comply with Division 03 Section "Cast-in-place Concrete".
 3. Form-Facing Materials: Comply with Division 03 Section "Cast-in-place Concrete".
 4. Shotcrete: Comply with Division 03 Section "Shotcrete".
 5. Preplaced Aggregate: Washed aggregate complying with ASTM C 33, Class 5S, with 95 to 100 percent passing a 1-1/2-inch (37.5-mm) sieve, 40 to 80 percent passing a 1-inch (25-mm) sieve, 20 to 45 percent passing a 3/4-inch (19-mm) sieve, 0 to 10 percent passing a 1/2-inch (12.5-mm) sieve, and 0 to 2 percent passing a 3/8-inch (9.5-mm) sieve **OR** 100 percent passing a 1-1/2-inch (37.5-mm) sieve, 95 to 100 percent passing a 1-inch (25-mm) sieve, 40 to 80 percent passing a 3/4-inch (19-mm) sieve, 0 to 15 percent passing a 1/2-inch (12.5-mm) sieve, and 0 to 2 percent passing a 3/8-inch (9.5-mm) sieve, **as directed**.
 6. Fine Aggregate for Grout Used with Preplaced Aggregate: Fine aggregate complying with ASTM C 33, but with 100 percent passing a No. 8 (2.36-mm) sieve, 95 to 100 percent passing a No. 16 (1.18-mm) sieve, 55 to 80 percent passing a No. 30 (0.6-mm) sieve, 30 to 55 percent passing a No. 50 (0.3-mm) sieve, 10 to 30 percent passing a No. 100 (0.15-mm) sieve, 0 to 10 percent passing a No. 200 (0.075-mm) sieve, and having a fineness modulus of 1.30 to 2.10.
 7. Grout Fluidifier for Grout Used with Preplaced Aggregate: ASTM C 937.
 8. Portland Cement for Grout Used with Preplaced Aggregate: ASTM C 150.
 9. Pozzolans for Grout Used with Preplaced Aggregate: ASTM C 618.
- D. Miscellaneous Materials
1. Epoxy Joint Filler: 2-component, semirigid, 100 percent solids, epoxy resin with a Type A Shore durometer hardness of at least 80 per ASTM D 2240.
 2. Polyurea Joint Filler: 2-component, semirigid, 100 percent solids, polyurea resin with a Type A Shore durometer hardness of at least 80 per ASTM D 2240.
 3. Epoxy Crack Injection Adhesive: ASTM C 881/C 881M, Type I **OR** IV, **as directed**, Grade 1, except for gel time **OR** solvent free, **as directed**.
 4. Capping Adhesive: Product manufactured for use with crack injection adhesive by same manufacturer.
 5. Corrosion-Inhibiting Treatment Materials: Water-based solution of alkaline corrosion-inhibiting chemicals that penetrates concrete by diffusion and forms a protective film on steel reinforcement.
 6. Polymer Overlay: Epoxy adhesive complying with ASTM C 881/C 881M, Type III.
 7. Aggregate for Use with Polymer Overlay: Oven-dried, washed silica sand complying with ACI 503.3.
 8. Polymer Sealer: Low-viscosity epoxy or high-molecular-weight methacrylate penetrating sealer recommended by manufacturer for application to exterior concrete traffic surfaces.
 9. Methylmethacrylate Sealer/Brighteners: Clear low-viscosity sealer recommended by manufacturer for sealing exterior exposed-aggregate concrete, and formulated to bring out color of aggregates and give concrete a wet look.
 10. Steel Plates, Shapes, and Bars: ASTM A 36/A 36M.
 - a. After fabricating, prepare surfaces to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."

- b. For minimum protection to steel after preparation, apply one coat of lead- and chromate-free, modified-alkyd primer complying with MPI#76 and one coat of alkyd-gloss enamel complying with MPI#96.
- c. After preparation, apply two-coat high-performance coating system consisting of organic zinc-rich primer, complying with SSPC-Paint 20 or SSPC-Paint 29 and topcoat of high-build, urethane or epoxy coating recommended by manufacturer for application over specified zinc-rich primer. Comply with coating manufacturer's written directions and with requirements in SSPC-PA 1, "Paint Application Specification No. 1: Shop, Field, and Maintenance Painting of Steel," for shop painting.
- 11. Bolts, Nuts, and Washers: Carbon steel; **ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6)**, for bolts; **ASTM A 563 (ASTM A 563M)**, Grade A, for nuts; and **ASTM F 436 (ASTM F 436M)** for washers; hot-dip or mechanically zinc coated.
- 12. Postinstalled Anchors: Chemical or expansion anchors, made from stainless-steel components complying with **ASTM F 593 and ASTM F 594, Alloy Group 1 or 2 (ASTM F 738M and ASTM F 836M, Alloy Group A1 or A4)** for bolts and nuts; ASTM A 666 or ASTM A 276, Type 304 or 316, for anchors, with capability to sustain, without failure, a load equal to four times the load imposed, as determined by testing per ASTM E 488, conducted by a qualified independent testing agency.
- 13. Composite Structural Reinforcement: Manufacturer's system consisting of carbon **OR** glass, **as directed**,-fiber reinforcement in the form of preimpregnated sheets or tow sheet with field-applied saturant, and epoxy primers, fillers, adhesives, saturants, and topcoats, designed for use as external structural reinforcement for concrete.

E. Mixes

- 1. Mix products, in clean containers, according to manufacturer's written instructions.
 - a. Add clean silica sand and coarse aggregates to products only as recommended by manufacturer.
 - b. Do not add water, thinners, or additives unless recommended by manufacturer.
 - c. When practical, use manufacturer's premeasured packages to ensure that materials are mixed in proper proportions. When premeasured packages are not used, measure ingredients using graduated measuring containers; do not estimate quantities or use shovel or trowel as unit of measure.
 - d. Do not mix more materials than can be used within recommended open time. Discard materials that have begun to set.
- 2. Mortar Scrub-Coat: Mix with enough water to provide consistency of thick cream.
- 3. Dry-Pack Mortar: Mix with just enough liquid to form damp cohesive mixture that can be squeezed by hand into a ball but is not plastic.
- 4. Concrete: Comply with Division 03 Section "Cast-in-place Concrete".
- 5. Shotcrete: Comply with Division 03 Section "Shotcrete".
- 6. Grout for Use with Preplaced Aggregate: Proportion according to ASTM C 938. Add grout fluidifier to mixing water followed by cementitious materials and then fine aggregate.

1.3 EXECUTION

A. Examination

- 1. Notify the Owner seven days in advance of dates when areas of deteriorated or delaminated concrete and deteriorated reinforcing bars will be located.
- 2. Locate areas of deteriorated or delaminated concrete using hammer or chain drag sounding and mark boundaries. Mark areas for removal by simplifying and squaring off boundaries. At columns and walls make boundaries level and plumb, unless otherwise indicated.
- 3. Locate at least three reinforcing bars using a pachometer, and drill test holes to determine depth of cover. Calibrate pachometer, using depth of cover measurements, and verify depth of cover in removal areas using pachometer.

B. Preparation

1. Protect people, motor vehicles, equipment, surrounding construction, Project site, plants, and surrounding buildings from injury resulting from concrete rehabilitation work.
 - a. Erect and maintain temporary protective covers over pedestrian walkways and at points of entrance and exit for people and vehicles, unless such areas are made inaccessible during the course of concrete rehabilitation work. Construct covers of tightly fitted, **3/4-inch (19-mm)** exterior-grade plywood supported at **16 inches (405 mm)** o.c. and covered with asphalt roll roofing.
 - b. Protect adjacent equipment and surfaces by covering them with heavy polyethylene film and waterproof masking tape or a liquid strippable masking agent. If practical, remove items, store, and reinstall after potentially damaging operations are complete.
 - c. Neutralize and collect alkaline and acid wastes according to requirements of authorities having jurisdiction, and dispose of by legal means off the Owner's property.
 - d. Dispose of runoff from wet operations by legal means and in a manner that prevents soil erosion, undermining of paving and foundations, damage to landscaping, and water penetration into building interiors.
 - e. Collect runoff from wet operations and dispose of by legal means off the Owner's property.
2. Shoring: Install temporary supports before beginning concrete removal.
3. Concrete Removal:
 - a. Saw-cut perimeter of areas indicated for removal to a depth of at least **1/2 inch (13 mm)**. Make cuts perpendicular to concrete surfaces and no deeper than cover on reinforcement.
 - b. Remove deteriorated and delaminated concrete by breaking up and dislodging from reinforcement.
 - c. Remove additional concrete, if necessary, to provide a depth of removal of at least **1/2 inch (13 mm)** over entire removal area.
 - d. Where half or more of the perimeter of reinforcing bar is exposed, bond between reinforcing bar and surrounding concrete is broken, or reinforcing bar is corroded, remove concrete from entire perimeter of bar and to provide at least a **3/4-inch (19-mm)** clearance around bar.
 - e. Test areas where concrete has been removed by tapping with hammer, and remove additional concrete until unsound and disbonded concrete is completely removed.
 - f. Provide fractured aggregate surfaces with a profile of at least **1/8 inch (3 mm)** that are approximately perpendicular or parallel to original concrete surfaces. At columns and walls, make top and bottom surfaces level, unless otherwise directed.
 - g. Thoroughly clean removal areas of loose concrete, dust, and debris.
4. Reinforcing Bar Preparation: Remove loose and flaking rust from reinforcing bars by high-pressure water cleaning **OR** abrasive blast cleaning **OR** needle scaling **OR** wire brushing, **as directed**, until only tightly bonded light rust remains.
 - a. Where section loss of reinforcing bar is more than 25 percent, or 20 percent in 2 or more adjacent bars, cut bars and remove and replace. Remove additional concrete as necessary to provide at least **3/4-inch (19-mm)** clearance at existing and replacement bars. Splice replacement bars to existing bars according to **ACI 318 (ACI 318M)**, by lapping, welding, or using mechanical couplings.
5. Preparation of Floor Joints for Repair: Saw-cut joints full width to edges and depth of spalls, but not less than **3/4 inch (19 mm) OR 1 inch (25 mm) OR 2 inches (50 mm)**, **as directed**, deep. Clean out debris and loose concrete; vacuum or blow clear with compressed air.
6. Surface Preparation for Corrosion-Inhibiting Treatment: Clean concrete by low-pressure water cleaning **OR** detergent scrubbing **OR** sand blasting, **as directed**, to remove dirt, oils, films, and other materials detrimental to treatment application. Allow surface to dry before applying corrosion-inhibiting treatment.
7. Surface Preparation for Overlays: Remove delaminated material and deteriorated concrete surface material. Roughen surface of concrete by sand blasting **OR** shot blasting **OR** scarifying **OR** needle scaling **OR** high-pressure water jetting **OR** scabbling **OR** flame blasting **OR** milling, **as directed**, to produce a surface profile matching **CSP 3 OR 4 OR 5 OR 6 OR 7 OR 8 OR 9**, **as directed**, per ICRI 03732. Sweep and vacuum roughened surface to remove debris followed by low-pressure water cleaning.

8. Surface Preparation for Sealers: Clean concrete by shot blasting **OR** low-pressure water cleaning **OR** detergent scrubbing, **as directed**, to remove dirt, oils, films, and other materials detrimental to sealer application.
9. Surface Preparation for Sealers: Acid etch surface of concrete to produce a surface profile matching CSP 1 per ICRI 03732. Prepare surface for acid etching by detergent scrubbing to remove oils and films that may prevent acid penetration.
 - a. Remove excess acid solution, reaction products, and debris by squeegeeing or vacuuming.
 - b. Scrub surface with an alkaline detergent, rinse, and squeegee or vacuum.
 - c. Check acidity of surface with pH test paper and continue rinsing until pH is acceptable.
 - d. When pH is acceptable and surface is clean, vacuum dry.
10. Surface Preparation for Composite Structural Reinforcement: Remove delaminated material and deteriorated concrete surface material. Clean concrete where reinforcement and epoxy patching mortar is to be applied by low-pressure water cleaning **OR** detergent scrubbing, **as directed**, to remove dirt, oils, films, and other materials detrimental to epoxy application. Roughen surface of concrete by sand blasting.

C. Application

1. General: Comply with manufacturer's written instructions and recommendations for application of products, including surface preparation.
2. Epoxy-Modified, Cementitious Bonding and Anticorrosion Agent: Apply to reinforcing bars and concrete by stiff brush or hopper spray according to manufacturer's written instructions. Apply to reinforcing bars in two coats, allowing first coat to dry two to three hours before applying second coat. Allow to dry before placing patching mortar or concrete.
3. Epoxy Bonding Agent: Apply to reinforcing bars and concrete by brush, roller, or spray according to manufacturer's written instructions, leaving no pinholes or other uncoated areas. Apply to reinforcing bars in at least two coats, allowing first coat to dry before applying second coat. Apply patching mortar or concrete while epoxy is still tacky. If epoxy dries, recoat before placing patching mortar or concrete.
4. Latex Bonding Agent, Type II: Mix with portland cement and scrub into concrete surface according to manufacturer's written instructions. Apply patching mortar or concrete while bonding agent is still wet. If bonding agent dries, recoat before placing patching mortar or concrete.
5. Latex Bonding Agent, Type I: Apply to concrete by brush roller or spray. Allow to dry before placing patching mortar or concrete.
6. Mortar Scrub-Coat: Dampen repair area and surrounding concrete **6 inches (150 mm)** beyond repair area. Remove standing water and apply scrub-coat with a brush, scrubbing it into surface and thoroughly coating repair area. If scrub-coat dries, recoat before applying patching mortar or concrete.
7. Patching Mortar: Unless otherwise recommended by manufacturer, apply as follows:
 - a. Wet substrate thoroughly and then remove standing water. Scrub a slurry of neat patching mortar mixed with latex bonding agent into substrate, filling pores and voids.
 - b. Place patching mortar by troweling toward edges of patch to force intimate contact with edge surfaces. For large patches, fill edges first and then work toward center, always troweling toward edges of patch. At fully exposed reinforcing bars, force patching mortar to fill space behind bars by compacting with trowel from sides of bars.
 - c. For vertical patching, place material in lifts of not more than **1 inch (25 mm) OR 1-1/2 inches (38 mm) OR 2 inches (50 mm) OR 3 inches (75 mm)**, **as directed**, nor less than **1/8 inch (3 mm) OR 1/4 inch (6 mm)**, **as directed**. Do not feather edge.
 - d. For overhead patching, place material in lifts of not more than **1 inch (25 mm) OR 1-1/2 inches (38 mm) OR 2 inches (50 mm)**, **as directed**, nor less than **1/8 inch (3 mm) OR 1/4 inch (6 mm)**, **as directed**. Do not feather edge.
 - e. After each lift is placed, consolidate material and screed surface.
 - f. Where multiple lifts are used, score surface of lifts to provide a rough surface for application of subsequent lifts. Allow each lift to reach final set before placing subsequent lifts.

- g. Allow surfaces of lifts that are to remain exposed to become firm and then finish to a smooth **OR** rough, **as directed**, surface with a wood or sponge float **OR** broom or burlap drag, **as directed**.
- h. Wet-cure cementitious patching materials, including polymer-modified, cementitious patching materials, for not less than seven days by water-fog spray or water-saturated absorptive cover.
- 8. Dry-Pack Mortar: Use for deep cavities and where indicated. Unless otherwise recommended by manufacturer, apply as follows:
 - a. Provide forms where necessary to confine patch to required shape.
 - b. Wet substrate and forms thoroughly and then remove standing water.
 - c. Place dry-pack mortar into cavity by hand, and compact into place with a hardwood drive stick and mallet or hammer. Do not place more material at a time than can be properly compacted. Continue placing and compacting until patch is approximately level with surrounding surface.
 - d. After cavity is filled and patch is compacted, trowel surface to match profile and finish of surrounding concrete. A thin coat of patching mortar may be troweled into the surface of patch to help obtain required finish.
 - e. Wet-cure patch for not less than seven days by water-fog spray or water-saturated absorptive cover.
- 9. Concrete: Place according to Division 03 Section "Cast-in-place Concrete" and as follows:
 - a. Apply epoxy-modified, cementitious bonding and anticorrosion agent **OR** epoxy bonding agent, **as directed**, to reinforcement and concrete substrate.
 - b. Apply latex bonding agent **OR** Type I, latex bonding agent **OR** mortar scrub-coat, **as directed**, to concrete substrate.
 - c. Use vibrators to consolidate concrete as it is placed.
 - d. At unformed surfaces, screed concrete to produce a surface that when finished with patching mortar will match required profile and surrounding concrete.
 - e. Where indicated place concrete by form and pump method.
 - 1) Design and construct forms to resist pumping pressure in addition to weight of wet concrete. Seal joints and seams in forms and junctions of forms with existing concrete.
 - 2) Pump concrete into place, releasing air from forms as concrete is introduced. When formed space is full, close air vents and pressurize to **14 psi (96 kPa)**.
 - f. Wet-cure concrete for not less than seven days by leaving forms in place or keeping surfaces continuously wet by water-fog spray or water-saturated absorptive cover.
 - g. Fill placement cavities with dry-pack mortar and repair voids with patching mortar. Finish to match surrounding concrete.
- 10. Shotcrete: Place according to Division 03 Section "Shotcrete" and as follows:
 - a. Apply epoxy-modified, cementitious bonding and anticorrosion agent **OR** epoxy bonding agent, **as directed**, to reinforcement and concrete substrate.
 - b. Apply latex bonding agent **OR** Type I, latex bonding agent **OR** mortar scrub-coat, **as directed**, to concrete substrate.
 - c. Screed and finish shotcrete to produce a surface matching required profile and surrounding concrete.
- 11. Grouted Preplaced Aggregate Concrete: Use for column and wall repairs **OR** where indicated, **as directed**. Place as follows:
 - a. Design and construct forms to resist pumping pressure in addition to weight of wet grout. Seal joints and seams in forms and junctions of forms with existing concrete.
 - b. Apply epoxy-modified, cementitious bonding and anticorrosion agent **OR** epoxy bonding agent, **as directed**, to reinforcement and concrete substrate.
 - c. Place aggregate in forms, consolidating aggregate as it is placed. Pack aggregate into upper areas of forms to achieve intimate contact with concrete surfaces.
 - d. Fill forms with water to thoroughly dampen aggregate and substrates. Drain water from forms before placing grout.

- e. Pump grout into place at bottom of preplaced aggregate, forcing grout upward. Release air from forms at top as grout is introduced. When formed space is full and grout flows from air vents, close vents and pressurize to **14 psi (96 kPa)**.
 - f. Wet-cure concrete for not less than seven days by leaving forms in place or keeping surfaces continuously wet by water-fog spray or water-saturated absorptive cover.
 - g. Repair voids with patching mortar and finish to match surrounding concrete.
12. Joint Filler: Install in nonmoving floor joints where indicated.
- a. Install filler to a depth of at least **3/4 inch (19 mm) OR 1 inch (25 mm) OR 2 inches (50 mm)**, **as directed**. Use fine silica sand no more than **1/4 inch (6 mm)** deep to close base of joint. Do not use sealant backer rods or compressible fillers below joint filler.
 - b. Install filler so that when cured, it is flush at top surface of adjacent concrete. If necessary, overfill joint and remove excess when filler has cured.
13. Epoxy Crack Injection: Comply with manufacturer's written instructions and the following:
- a. Clean areas to receive capping adhesive of oil, dirt, and other substances that would interfere with bond, and clean cracks with oil-free compressed air or low-pressure water to remove loose particles.
 - b. Place injection ports as recommended by epoxy manufacturer, spacing no farther apart than thickness of member being injected. Seal injection ports in place with capping adhesive.
 - c. Seal cracks at exposed surfaces with a ribbon of capping adhesive at least **1/4 inch (6 mm)** thick by **1 inch (25 mm)** wider than crack.
 - d. Inject cracks wider than **0.003 inch (0.075 mm)** to a depth of **8 inches (200 mm)** or to a width of less than **0.003 inch (0.075 mm)**, whichever is less.
 - e. Inject epoxy adhesive, beginning at widest part of crack and working toward narrower parts. Inject adhesive into ports to refusal, capping adjacent ports when they extrude epoxy. Cap injected ports and inject through adjacent ports until crack is filled.
 - f. After epoxy adhesive has set, remove injection ports and grind surfaces smooth.
14. Corrosion-Inhibiting Treatment: Apply by brush, roller, or airless spray in two coats at manufacturer's recommended application rate. Remove film of excess treatment by high-pressure washing before patching treated concrete or applying a sealer or overlay.
15. Polymer Overlay: Apply according to ACI 503.3.
- a. Apply to traffic-bearing surfaces, including parking areas and walks.
16. Polymer Sealer: Apply by brush, roller, or airless spray at manufacturer's recommended application rate.
- a. Apply to traffic-bearing surfaces, including parking areas and walks.
17. Methylmethacrylate Sealer/Brighteners: Apply by brush, roller, or airless spray at manufacturer's recommended application rate.
- a. Apply to exterior concrete surfaces that are exposed to view, excluding traffic-bearing surfaces.
18. Composite Structural Reinforcement Using Preimpregnated Fiber Sheet: Unless otherwise recommended by manufacturer, apply as follows:
- a. Patch surface defects with epoxy mortar and allow to set before beginning reinforcement application.
 - b. Apply epoxy adhesive to a thickness of **1/16 inch (1.6 mm)** to prepared concrete surfaces in areas where composite structural reinforcement will be applied.
 - c. Clean preimpregnated fiber sheet with acetone or other suitable solvent, and apply epoxy adhesive to a thickness of **1/16 inch (1.6 mm)**.
 - d. Apply adhesive-coated fiber sheet to adhesive-coated concrete within open time of epoxy adhesive, and roll with a hard rubber roller until fiber sheet is fully embedded in adhesive, air pockets are removed, and adhesive is forced out from beneath fiber sheet at edges.
 - e. Apply additional layers as indicated using same procedure.
19. Composite Structural Reinforcement Using Fiber Tow Sheet and Saturant: Unless otherwise recommended by manufacturer, apply as follows:
- a. Apply epoxy primer using brush or short nap roller to prepared concrete surfaces in areas where composite structural reinforcement will be applied.

- b. After primer has set, patch surface defects with epoxy filler and allow to set before beginning reinforcement application.
 - c. Apply epoxy saturant to fiber tow sheet or primed and patched surface with **3/8-inch- (10-mm-)** nap roller. Apply fiber tow sheet to primed and patched surface while saturant is still wet, using pressure roller to remove air pockets. Remove paper backing from fiber tow sheet and apply additional epoxy as needed to fully saturate tow sheet.
 - d. Apply additional layers as indicated, fully saturating each with epoxy.
 - e. After saturant has cured, apply protective topcoat by brush, roller or spray.
- D. Field Quality Control
- 1. Testing Agency: Engage a qualified testing agency to sample materials and perform tests as follows:
 - a. Patching Mortar, Packaged Mixes: **<Insert number>** randomly selected samples tested according to ASTM C 928.
 - b. Patching Mortar, Field Mixed: **<Insert number>** randomly selected samples tested for compressive strength according to ASTM C 109/C 109M.
 - c. Concrete: As specified in Division 03 Section "Cast-in-place Concrete".
 - d. Shotcrete: As specified in Division 03 Section "Shotcrete".
 - e. Grouted Preplaced Aggregate: Tested for compressive strength of grout according to ASTM C 942.
 - 1) Testing Frequency: One sample for each **25 cu. yd. (19 cu. m)** of grout or fraction thereof, but not less than one sample for each day's work.
 - f. Joint Filler: Core drilled samples to verify proper installation.
 - 1) Testing Frequency: One sample for each **100 feet (30 m)** of joint filled.
 - 2) Where samples are taken, fill holes with joint filler.
 - g. Epoxy Crack Injection: Core drilled samples to verify proper installation.
 - 1) Testing Frequency: 3 samples from mockup and 1 sample for each **100 feet (30 m)** of crack injected.
 - 2) Where samples are taken, fill holes with epoxy mortar.

END OF SECTION 03 01 30 71

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 01 30 71a - SELF-ADHERING SHEET WATERPROOFING

1.1 GENERAL

A. Description Of Work:

1. This specification covers the furnishing and installation of materials for self-adhering sheet waterproofing. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Modified bituminous sheet waterproofing.
 - b. Modified bituminous sheet waterproofing, fabric reinforced.
 - c. Modified bituminous deck paving sheet waterproofing.
 - d. Modified bituminous composite panel waterproofing.
 - e. Adhesive-coated HDPE sheet waterproofing.
 - f. Molded-sheet drainage panels.
 - g. Insulation.
 - h. Plaza deck pavers and paver pedestals.

C. Submittals

1. Product Data: Include manufacturer's written instructions for evaluating, preparing, and treating substrate, technical data, and tested physical and performance properties of waterproofing.
2. Shop Drawings: Show locations and extent of waterproofing. Include details for substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.
3. Product Test Reports: Based on evaluation of comprehensive tests performed by a qualified testing agency, for waterproofing.
4. Special warranties.
5. LEED Submittals:
 - a. Product Certificates for Credit MR 5: For products and materials required to comply with requirements for regional materials, certificates indicating location of material manufacturer and point of extraction, harvest, or recovery for each raw material. Include statement indicating distance to Project, cost for each regional material, and fraction by weight that is considered regional.
 - b. Shop Drawings: Show locations and extent of waterproofing and details of substrate joints and cracks, sheet flashings, penetrations, inside and outside corners, tie-ins with adjoining waterproofing, and other termination conditions.
 - 1) Include setting drawings showing layout, sizes, sections, profiles, and joint details of pedestal-supported concrete pavers.
 - c. Samples: For each exposed product and for each color and texture specified, including the following products:
 - 1) 8-by-8-inch (200-by-200-mm) square of waterproofing and flashing sheet.
 - 2) 8-by-8-inch (200-by-200-mm) square of insulation.
 - 3) 4-by-4-inch (100-by-100-mm) square of drainage panel.
 - 4) Plaza-deck paver, 4-by-4-inch (100-by-100-mm) square **OR** full sized, **as directed**, in each color and texture required.
 - 5) Paver pedestal assembly.

D. Quality Assurance

1. Installer Qualifications: A firm that is approved or licensed by **OR** acceptable to, **as directed**, waterproofing manufacturer for installation of waterproofing required for this Project.
2. Preinstallation Conference: Conduct conference at Project site.

- a. Review waterproofing requirements including surface preparation, substrate condition and pretreatment, minimum curing period, forecasted weather conditions, special details and sheet flashings, installation procedures, testing and inspection procedures, and protection and repairs.

E. Delivery, Storage, And Handling

1. Deliver liquid materials to Project site in original packages with seals unbroken, labeled with manufacturer's name, product brand name and type, date of manufacture, and directions for storing and mixing with other components.
2. Store liquid materials in their original undamaged packages in a clean, dry, protected location and within temperature range required by waterproofing manufacturer.
3. Remove and replace liquid materials that cannot be applied within their stated shelf life.
4. Store rolls according to manufacturer's written instructions.
5. Protect stored materials from direct sunlight.

F. Project Conditions

1. Environmental Limitations: Apply waterproofing within the range of ambient and substrate temperatures recommended by waterproofing manufacturer. Do not apply waterproofing to a damp or wet substrate.

G. Warranty

1. Special Manufacturer's Warranty: Manufacturer's standard form in which manufacturer agrees to replace waterproofing material that does not comply with requirements or that fails to remain watertight within specified warranty period.
 - a. Warranty Period: Three **OR** Five, **as directed**, years from date of Final Completion.

1.2 PRODUCTS

A. Modified Bituminous Sheet Waterproofing

1. Modified Bituminous Sheet: Not less than **60-mil- (1.5-mm-)** thick, self-adhering sheet consisting of **56 mils (1.4 mm)** of rubberized asphalt laminated to a **4-mil- (0.10-mm-)** thick, polyethylene film with release liner on adhesive side and formulated for application with primer or surface conditioner that complies with VOC limits of authorities having jurisdiction.
 - a. Physical Properties:
 - 1) Tensile Strength: **250 psi (1.7 MPa)** minimum; ASTM D 412, Die C, modified.
 - 2) Ultimate Elongation: 300 percent minimum; ASTM D 412, Die C, modified.
 - 3) Low-Temperature Flexibility: Pass at **minus 20 deg F (minus 29 deg C)**; ASTM D 1970.
 - 4) Crack Cycling: Unaffected after 100 cycles of **1/8-inch (3-mm)** movement; ASTM C 836.
 - 5) Puncture Resistance: **40 lbf (180 N)** minimum; ASTM E 154.
 - 6) Hydrostatic-Head Resistance: **150 feet (45 m)** minimum; ASTM D 5385.
 - 7) Water Absorption: 0.15 percent weight-gain maximum after 48-hour immersion at **70 deg F (21 deg C)**; ASTM D 570.
 - 8) Vapor Permeance: **0.05 perms (2.9 ng/Pa x s x sq. m)**; ASTM E 96, Water Method.
2. Modified Bituminous Sheet, Fabric Reinforced: **60-mil- (1.5-mm-)** thick, self-adhering sheet consisting of rubberized-asphalt membrane embedded in spun-bonded polyester or fiberglass nonwoven fabric reinforcement laminated to a **0.50-mil- (0.01-mm-)** thick polyester film with release liner on adhesive side.
 - a. Physical Properties:
 - 1) Pliability: No cracks when bent 180 degrees over a **1-inch (25-mm)** mandrel at **minus 25 deg F (minus 32 deg C)**; ASTM D 146.
 - 2) Hydrostatic-Head Resistance: **150 feet (45 m)** minimum.
 - 3) Vapor Permeance: **0.05 perms (2.9 ng/Pa x s x sq. m)**; ASTM E 96, Water Method.

- B. Modified Bituminous Deck Paving Sheet Waterproofing
1. Modified Bituminous Deck Paving Sheet: Provide one of the products described below, **as directed**:
 - a. **65-mil- (1.6-mm-)** thick, self-adhering sheets consisting of **53 to 56 mils (1.3 to 1.4 mm)** of rubberized asphalt laminated to a heat-resisting, **9- to 12-mil- (0.2- to 0.3-mm-)** thick, woven polypropylene geotextile reinforcement with release liner on adhesive side.
 - b. **70-mil- (1.8-mm-)** thick, self-adhering sheets consisting of rubberized asphalt embedded in inert fabric reinforcement laminated to a reflective geotextile protective topping with release liner on adhesive side.
 - c. **60-mil- (1.5-mm-)** thick, self-adhering sheets consisting of rubberized asphalt embedded in nonwoven **OR** woven, **as directed**, fiberglass fabric reinforcement laminated to a **0.50-mil- (0.01-mm-)** thick polyester mat with release liner on adhesive side.
 - d. Physical Properties:
 - 1) Tensile Strength, Membrane: **50 lbf/in (8.75 kN/m)** minimum; ASTM D 882.
 - 2) Pliability: Unaffected when bent 180 degrees over a **1/4-inch (6.4-mm)** mandrel at **minus 15 deg F (minus 26 deg C)**; ASTM D 146.
 - 3) Puncture Resistance, Mesh: **200 lbf (890 N)** minimum; ASTM E 154.
- C. Modified Bituminous Composite Panel Waterproofing
1. Modified Bituminous Composite Panel: **90-mil- (2.2-mm-)** thick, multilaminated panel consisting of a protection course bonded to an asphalt saturated carrier sheet bonded to a rubberized asphalt waterproofing self-adhering membrane with release liner.
- D. Adhesive-Coated HDPE Sheet Waterproofing
1. Adhesive-Coated HDPE Sheet for Vertical Applications: **32-mil- (0.8-mm-)** thick, uniform, flexible sheets consisting of **16-mil- (0.4-mm-)** thick, HDPE sheet coated with a pressure-sensitive rubber adhesive, a protective adhesive coating, and a release liner with the following physical properties:
 - a. Tensile Strength, Film: **4000 psi (27.6 MPa)** minimum; ASTM D 412.
 - b. Low-Temperature Flexibility: Pass at **minus 10 deg F (minus 23 deg C)**; ASTM D 1970.
 - c. Peel Adhesion to Concrete: **5 lbf/in. (875 N/m)**; ASTM D 903, modified.
 - d. Lap Adhesion: **2.5 lbf/in. (440 N/m)**; ASTM D 1876, modified.
 - e. Hydrostatic-Head Resistance: **231 feet (70 m)**; ASTM D 5385, modified.
 - f. Vapor Permeance: **0.01 perms (0.6 ng/Pa x s x sq. m)**; ASTM E 96, Water Method.
 - g. Water Absorption: 0.5 percent; ASTM D 570.
 2. Adhesive-Coated HDPE Sheet for Horizontal Applications: **46-mil- (1.2-mm-)** thick, uniform, flexible sheets consisting of **30-mil- (0.76-mm-)** thick, HDPE sheet coated with a pressure-sensitive rubber adhesive, a protective adhesive coating, a detackifying surface treatment, an uncoated self-adhering side lap strip, and a release liner with the following physical properties:
 - a. Tensile Strength, Film: **4000 psi (27.6 MPa)** minimum; ASTM D 412.
 - b. Low-Temperature Flexibility: Pass at **minus 10 deg F (minus 23 deg C)**; ASTM D 1970.
 - c. Peel Adhesion to Concrete: **5 lbf/in. (875 N/m)**; ASTM D 903, modified.
 - d. Lap Adhesion: **2.5 lbf/in. (440 N/m)**; ASTM D 1876, modified.
 - e. Hydrostatic-Head Resistance: **231 feet (70 m)**; ASTM D 5385, modified.
 - f. Vapor Permeance: **0.01 perms (0.6 ng/Pa x s x sq. m)**; ASTM E 96, Water Method.
 - g. Water Absorption: 0.5 percent; ASTM D 570.
- E. Auxiliary Materials
1. General: Furnish auxiliary materials recommended by waterproofing manufacturer for intended use and compatible with sheet waterproofing.
 - a. Furnish liquid-type auxiliary materials that comply with VOC limits of authorities having jurisdiction.
 2. Primer: Liquid waterborne **OR** solvent-borne, **as directed**, primer recommended for substrate by manufacturer of sheet waterproofing material.
 3. Surface Conditioner: Liquid, waterborne surface conditioner recommended for substrate by manufacturer of sheet waterproofing material.

4. Liquid Membrane: Elastomeric, two-component liquid, cold fluid applied, trowel grade or low viscosity.
 5. Substrate Patching Membrane: Low-viscosity, two-component, asphalt-modified coating.
 6. Sheet Strips: Self-adhering, rubberized-asphalt sheet strips of same material and thickness as sheet waterproofing.
 7. Mastic, Adhesives, and Tape: Liquid mastic and adhesives, and adhesive tapes recommended by waterproofing manufacturer.
 - a. Detail Tape: Two-sided, pressure-sensitive, self-adhering reinforced tape, 4-1/2 inches (114 mm) wide, with a tack-free protective adhesive coating on one side and release film on self-adhering side.
 - b. Detail Strips: 62.5-mil- (1.58-mm-) thick, felt-reinforced self-adhesive strip, 9 inches (229 mm) wide, with release film on adhesive side.
 8. Metal Termination Bars: Aluminum bars, approximately 1 by 1/8 inch (25 by 3 mm) thick, predrilled at 9-inch (229-mm) centers.
 9. Protection Course: ASTM D 6506, semirigid sheets of fiberglass or mineral-reinforced-asphaltic core, pressure laminated between two asphalt-saturated fibrous liners and as follows:
 - a. Thickness: 1/8 inch (3 mm), nominal, for vertical applications; 1/4 inch (6 mm), nominal, elsewhere.
 - b. Adhesive: Rubber-based solvent type recommended by waterproofing manufacturer for type of protection course.
 10. Protection Course: Fan folded, with a core of extruded-polystyrene board insulation faced one side or both sides with plastic film, nominal thickness 1/4 inch (6 mm), with compressive strength of not less than 8 psi (55 kPa) per ASTM D 1621, and maximum water absorption by volume of 0.6 percent per ASTM C 272.
 11. Protection Course: Unfaced, fan-folded, extruded-polystyrene board insulation, nominal thickness 1/4 inch (6 mm) with compressive strength of not less than 8 psi (55 kPa) per ASTM D 1621.
 12. Protection Course: Extruded-polystyrene board insulation, unfaced, ASTM C 578, Type X, 1/2 inch (13 mm) thick.
 13. Protection Course: Molded-polystyrene board insulation, ASTM C 578, Type I, 0.90-lb/cu. ft. (15-kg/cu. m) minimum density, 1-inch (25-mm) minimum thickness.
- F. Molded-Sheet Drainage Panels
1. Molded-Sheet Drainage Panel: Comply with Division 33 Section "Subdrainage".
 2. Nonwoven-Geotextile-Faced, Molded-Sheet Drainage Panel: Manufactured composite subsurface drainage panels consisting of a nonwoven, needle-punched geotextile facing with an apparent opening size not exceeding No. 70 (0.21-mm) sieve laminated to one side with or without a polymeric film bonded to the other side of a studded, nonbiodegradable, molded-plastic-sheet drainage core, with a vertical flow rate of 9 to 15 gpm per ft. (112 to 188 L/min. per m).
 3. Woven-Geotextile-Faced, Molded-Sheet Drainage Panel: Manufactured composite subsurface drainage panels consisting of a woven-geotextile facing with an apparent opening size not exceeding No. 40 (0.425-mm) sieve laminated to one side with or without a polymeric film bonded to the other side of a studded, nonbiodegradable, molded-plastic-sheet drainage core, with a horizontal flow rate not less than 2.8 gpm per ft. (35 L/min. per m).
- G. Insulation
1. Board Insulation: Extruded-polystyrene board insulation complying with ASTM C 578, square or shiplap edged.
 - a. Type IV, 25-psi (173-kPa) minimum compressive strength.
 - b. Type VI, 40-psi (276-kPa) minimum compressive strength.
 - c. Type VII, 60-psi (414-kPa) minimum compressive strength.
 - d. Type V, 100-psi (690-kPa) minimum compressive strength.
 2. Unfaced Wall Insulation Drainage Panels: Extruded-polystyrene board insulation complying with ASTM C 578, Type IV, 25-psi (173-kPa) or Type VI, 40-psi (276-kPa) minimum compressive

- strength; unfaced; fabricated with shiplap or channel edges and with 1 side having grooved drainage channels.
3. Geotextile-Faced Wall Insulation Drainage Panels: Extruded-polystyrene board insulation complying with ASTM C 578, Type IV, **25-psi (173-kPa)** or Type VI, **40-psi (276-kPa)** minimum compressive strength; fabricated with tongue-and-groove edges and with 1 side having grooved drainage channels faced with nonwoven geotextile filter fabric.
 4. Unfaced Plaza Deck Insulation Drainage Panels: Extruded-polystyrene board insulation complying with ASTM C 578, Type VI, **40-psi (276-kPa)** OR Type VII, **60-psi (414-kPa)**, **as directed**, minimum compressive strength; unfaced; fabricated with shiplapped or channel edges and with 1 side having ribbed drainage channels.
 5. Geotextile-Faced Plaza Deck Insulation Drainage Panels: Extruded-polystyrene board insulation complying with ASTM C 578, Type VII, **60-psi (414-kPa)** minimum compressive strength; fabricated with tongue-and-groove edges and with 1 side having grooved drainage channels faced with manufacturer's standard, nonwoven geotextile filter fabric.
- H. Plaza Deck Pavers
1. Plaza Deck Pavers: Brick **OR** Concrete **OR** Asphalt-Block, **as directed**, pavers specified in Division 32 Section "Unit Paving".
 2. Plaza Deck Pavers: Granite **OR** Limestone **OR** Marble **OR** Quartz-Based Stone **OR** Slate, **as directed**, pavers specified in Division 09 Section "Stone Flooring".
 3. Plaza Deck Pavers: Heavyweight, hydraulically pressed, concrete units, square edged **OR** with top edges beveled **3/16 inch (5 mm)**, **as directed**, manufactured for use as plaza deck pavers; minimum compressive strength **7500 psi (52 mpa)** or **6500 psi (45 mpa)**, **as directed**, ASTM C 140; absorption not greater than 5 percent, ASTM C 140; no breakage and maximum 1 percent mass loss when tested for freeze-thaw resistance according to ASTM C 67.
 - a. Thickness: **1-5/8 inches (41 mm)** **OR** **1-3/4 inches (45 mm)** **OR** **2 inches (51 mm)** **OR** **2-3/8 inches (60 mm)**, **as directed**.
 - b. Face Size: **8-7/8 inches (225 mm)** square **OR** **9 inches (229 mm)** square **OR** **9 by 18 inches (229 by 457 mm)** **OR** **12 inches (305 mm)** square **OR** **12 by 24 inches (305 by 610 mm)** **OR** **18 inches (457 mm)** square **OR** **24 inches (610 mm)** square **OR** As indicated, **as directed**.
 - c. Color: As indicated by manufacturer's designations **OR** Match sample **OR** As selected from manufacturer's full range, **as directed**.
 4. Setting Bed: Provide aggregate **OR** mortar **OR** bituminous, **as directed**, setting-bed materials specified in Division 32 Section "Unit Paving".
 5. Paver Pedestals: Paver manufacturer's standard SBR rubber, HDPE, or polyurethane paver support assembly, including fixed-height **OR** adjustable or stackable, **as directed**, pedestals, shims, and spacer tabs for joint spacing of **1/8 inch (3 mm)** **OR** **3/16 inch (5 mm)** **OR** **1/8 to 3/16 inch (3 to 5 mm)**, **as directed**.
 - a. Concrete Fill: ACI 301, compressive strength of **5000 psi (34 MPa)** at 28 days and air content of 6 percent.

1.3 EXECUTION

- A. Surface Preparation
1. Clean, prepare, and treat substrates according to manufacturer's written instructions. Provide clean, dust-free, and dry substrates for waterproofing application.
 2. Mask off adjoining surfaces not receiving waterproofing to prevent spillage and overspray affecting other construction.
 3. Remove grease, oil, bitumen, form-release agents, paints, curing compounds, and other penetrating contaminants or film-forming coatings from concrete.
 4. Remove fins, ridges, mortar, and other projections and fill honeycomb, aggregate pockets, holes, and other voids.
 5. Prepare, fill, prime, and treat joints and cracks in substrates. Remove dust and dirt from joints and cracks according to ASTM D 4258.

- a. Install sheet strips and center over treated construction and contraction joints and cracks exceeding a width of **1/16 inch (1.6 mm)** or **1/8 inch (3 mm)** for modified bituminous deck paving waterproofing.
 6. Bridge and cover isolation joints, expansion joints, and discontinuous deck-to-wall and deck-to-deck joints with overlapping sheet strips.
 - a. Invert and loosely lay first sheet strip over center of joint. Firmly adhere second sheet strip to first and overlap to substrate.
 7. Corners: Prepare, prime, and treat inside and outside corners according to ASTM D 6135.
 - a. Install membrane strips centered over vertical inside corners. Install **3/4-inch (19-mm)** fillets of liquid membrane on horizontal inside corners and as follows:
 - 1) At footing-to-wall intersections, extend liquid membrane each direction from corner or install membrane strip centered over corner.
 - 2) At plaza deck-to-wall intersections, extend liquid membrane or sheet strips onto deck waterproofing and to finished height of sheet flashing.
 8. Prepare, treat, and seal vertical and horizontal surfaces at terminations and penetrations through waterproofing and at drains and protrusions according to ASTM D 6135.
- B. Modified Bituminous Sheet Waterproofing Application
1. Install modified bituminous sheets according to waterproofing manufacturer's written instructions and according to recommendations in ASTM D 6135.
 2. Apply primer to substrates at required rate and allow to dry. Limit priming to areas that will be covered by sheet waterproofing in same day. Reprime areas exposed for more than 24 hours.
 3. Apply and firmly adhere sheets over area to receive waterproofing. Accurately align sheets and maintain uniform **2-1/2-inch- (64-mm-)** minimum lap widths and end laps. Overlap and seal seams and stagger end laps to ensure watertight installation.
 - a. When ambient and substrate temperatures range between **25 and 40 deg F (minus 4 and plus 5 deg C)**, install self-adhering, modified bituminous sheets produced for low-temperature application. Do not use low-temperature sheets if ambient or substrate temperature is higher than **60 deg F (16 deg C)**.
 4. Two-Ply Application: Install sheets to form a membrane with lap widths not less than 50 percent of sheet widths to provide a minimum of 2 thicknesses of sheet membrane over areas to receive waterproofing.
 5. Horizontal Application: Apply sheets from low point to high point of decks to ensure that side laps shed water.
 6. Apply continuous sheets over sheet strips bridging substrate cracks, construction, and contraction joints.
 7. Seal exposed edges of sheets at terminations not concealed by metal counterflashings or ending in reglets with mastic.
 8. Install sheet waterproofing and auxiliary materials to tie into adjacent waterproofing.
 9. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Slit and flatten fishmouths and blisters. Patch with sheet waterproofing extending **6 inches (150 mm)** beyond repaired areas in all directions.
 10. Install protection course with butted joints over waterproofing membrane immediately.
 - a. Molded-sheet drainage panels **OR** Insulation drainage panels **OR** Board insulation, **as directed**, may be used in place of a separate protection course to vertical applications when approved by waterproofing manufacturer and installed immediately.
 11. Correct deficiencies in or remove sheet waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair sheet flashings.
- C. Modified Bituminous Deck Paving Sheet Waterproofing Application
1. Install modified bituminous deck paving sheets according to waterproofing manufacturer's written instructions.
 2. Apply primer to substrates at required rate and allow to dry. Limit priming to areas that will be covered by sheet waterproofing in same day. Reprime areas exposed for more than 24 hours.

3. Apply and firmly adhere sheets over areas to receive waterproofing. Accurately align sheets and maintain uniform **2-1/2-inch- (64-mm-)** minimum lap widths and **6-inch (150-mm)** end laps. Overlap and seal seams and stagger end laps to ensure watertight installation.
 4. Apply sheet waterproofing from low point to high point of decks to ensure that side laps shed water.
 5. Apply continuous sheets over sheet strips bridging substrate cracks, construction, and contraction joints.
 6. Seal edges of sheet waterproofing terminations with mastic.
 7. Install sheet waterproofing and auxiliary materials to tie into adjacent waterproofing.
 8. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Slit and flatten fishmouths and blisters. Patch with sheet waterproofing extending **6 inches (150 mm)** beyond repaired areas in all directions.
 9. Correct deficiencies in or remove sheet waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair sheet flashings.
- D. Modified Bituminous Composite Panel Waterproofing Application
1. Install modified bituminous composite panels according to waterproofing manufacturer's written instructions.
 2. Apply primer to substrate at required rate and allow to dry. Limit priming to areas that will be covered by waterproofing in same day. Reprime areas exposed for more than 24 hours.
 3. Install and firmly adhere composite panels over area to receive waterproofing. Accurately align and butt vertical and horizontal joints.
 4. Seal vertical and horizontal butt joints and exposed top, side, and bottom edges at composite panel waterproofing terminations with detail strips.
 5. Correct deficiencies in or remove composite panel waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair detail strips.
- E. Adhesive-Coated HDPE Sheet Waterproofing Application
1. Install adhesive-coated HDPE sheets according to manufacturer's written instructions.
 2. Place and secure molded-sheet drainage panels over substrate. Lap edges and ends of geotextile to maintain continuity.
 3. Vertical Applications: Install adhesive-coated HDPE sheet with HDPE face against substrate. Accurately align sheets and maintain uniform **3-inch- (75-mm-)** minimum lap widths and end laps. Overlap and seal seams and stagger and tape end laps to ensure watertight installation. Mechanically fasten to substrate.
 - a. Securely fasten top termination of membrane with continuous metal termination bar anchored into substrate and cover with detailing tape.
 4. Horizontal Applications: Install adhesive-coated HDPE sheet with HDPE face against substrate. Accurately align sheets and maintain uniform **3-inch- (75-mm-)** minimum lap widths and end laps. Overlap and seal seams. Overlap, stagger, and seal end laps with detail tape to ensure watertight installation.
 5. Corners: Seal lapped terminations and cut edges of sheet waterproofing at inside and outside corners with detail tape.
 6. Seal penetrations through sheet waterproofing to provide watertight seal with detail tape patches or wraps and a liquid-membrane troweling.
 7. Install sheet waterproofing and auxiliary materials to produce a continuous watertight tie into adjacent waterproofing.
 8. Repair tears, voids, and lapped seams in waterproofing not complying with requirements. Tape perimeter of damaged or nonconforming area extending **6 inches (150 mm)** beyond repaired areas in all directions. Apply a patch of sheet waterproofing and firmly secure with detail tape.
 9. Correct deficiencies in or remove waterproofing that does not comply with requirements; repair substrates, reapply waterproofing, and repair sheet flashings.
- F. Molded-Sheet Drainage Panel Installation
1. Place and secure molded-sheet drainage panels, with geotextile facing away from wall or deck substrate, according to manufacturer's written instructions. Use adhesives or mechanical

fasteners that do not penetrate waterproofing. Lap edges and ends of geotextile to maintain continuity. Protect installed molded-sheet drainage panels during subsequent construction.

- a. For vertical applications, install board insulation **OR** protection course, **as directed**, before installing drainage panels.

G. Insulation Installation

1. Install one or more layers of board insulation to achieve required thickness and insulation drainage panels over waterproofed surfaces. Cut and fit to within **3/4 inch (19 mm)** of projections and penetrations.
2. On vertical surfaces, set insulation units in adhesive or tape applied according to manufacturer's written instructions.
3. On horizontal surfaces, loosely lay insulation units according to manufacturer's written instructions. Stagger end joints and tightly abut insulation units.

H. Plaza Deck Paver Installation

1. Setting Bed: Install setting bed in locations and of thickness indicated to comply with requirements in Division 32 Section(s) "Unit Paving" OR Division 09 Section(s) "Stone Flooring", **as directed**.
2. Install concrete pavers in locations indicated according to manufacturer's written instructions.
3. Accurately install fixed **OR** adjustable, **as directed**, -height paver pedestals and accessories in locations and to elevations required. Adjust for final level and slope with shims.
 - a. Fill paver pedestal with concrete mix, strike smooth with top of pedestal, and cure according to ACI 301.
4. Loosely lay pavers on pedestals, maintaining a uniform open joint width. Tightly seat pavers against spacers to eliminate lateral movement or drift of paving assembly. Align joint patterns parallel in each direction.
 - a. Lay out pavers to avoid less-than-half-width pavers at perimeter or other terminations.
5. Install pavers to not vary more than **1/16 inch (1.6 mm)** in elevation between adjacent pavers or more than **1/16 inch (1.6 mm)** from surface plane elevation of individual paver.
6. Maintain tolerances of paving installation within **1/4 inch in 10 feet (1:48)** of surface plane in any direction.

I. Field Quality Control

1. Flood Testing: Flood test each deck area for leaks, according to recommendations in ASTM D 5957, after completing waterproofing but before overlying construction is placed. Install temporary containment assemblies, plug or dam drains, and flood with potable water.
 - a. Flood to an average depth of **2-1/2 inches (64 mm)** with a minimum depth of **1 inch (25 mm)** and not exceeding a depth of **4 inches (100 mm)**. Maintain **2 inches (51 mm)** of clearance from top of sheet flashings.
 - b. Flood each area for 24 **OR** 48 **OR** 72, **as directed**, hours.
 - c. After flood testing, repair leaks, repeat flood tests, and make further repairs until waterproofing installation is watertight.
2. Engage an independent testing agency to observe flood testing and examine underside of decks and terminations for evidence of leaks during flood testing.

J. Protection And Cleaning

1. Do not permit foot or vehicular traffic on unprotected membrane.
2. Protect waterproofing from damage and wear during remainder of construction period.
3. Protect installed board insulation **OR** insulation drainage panels, **as directed**, from damage due to UV light, harmful weather exposures, physical abuse, and other causes. Provide temporary coverings where insulation will be subject to abuse and cannot be concealed and protected by permanent construction immediately after installation.
4. Clean spillage and soiling from adjacent construction using cleaning agents and procedures recommended by manufacturer of affected construction.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 05 13 00 - ARCHITECTURAL CONCRETE

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for cast-in-place architectural concrete. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section specifies cast-in-place architectural concrete including form facings, reinforcement accessories, concrete materials, concrete mixture design, placement procedures, and finishes.

C. Definitions

1. Cast-in-Place Architectural Concrete: Formed concrete that is exposed to view on surfaces of completed structure or building and that requires special concrete materials, formwork, placement, or finishes to obtain specified architectural appearance.
2. Cementitious Materials: Portland cement alone or in combination with one or more of the following: blended hydraulic cement, fly ash and other pozzolans, ground granulated blast-furnace slag, and silica fume; subject to compliance with requirements.
3. Design Reference Sample: Sample designated by the Owner in the Contract Documents that reflects acceptable surface quality and appearance of cast-in-place architectural concrete.
4. Reveal: Projection of coarse aggregate from matrix or mortar after completion of exposure operations.

D. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittals:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - 1) Include statement indicating costs for each product having recycled content.
 - b. Design Mixtures for Credit ID 1.1: For each concrete mixture containing fly ash as a replacement for portland cement or other portland cement replacements and for equivalent concrete mixtures that do not contain portland cement replacements.
3. Design Mixtures: For each concrete mixture. Submit alternate design mixtures when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant adjustments.
 - a. Indicate amounts of mixing water to be withheld for later addition at Project site.
4. Formwork Shop Drawings: Show formwork construction including form-facing joints, rustications, construction and contraction joints, form joint-sealant details, form tie locations and patterns, inserts and embedments, cutouts, cleanout panels, and other items that visually affect cast-in-place architectural concrete.
5. Placement Schedule: Submit concrete placement schedule before start of placement operations. Include locations of all joints including construction joints.
6. Samples: For each of the following materials:
 - a. Form-facing panel.
 - b. Form ties.
 - c. Form liners.
 - d. Coarse- and fine-aggregate gradations.
 - e. Chamfers and rustications.
7. Material test reports **OR** certificates, **as directed**.

E. Quality Assurance

1. Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.
 - a. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities."
2. Testing Agency Qualifications: An independent agency qualified according to ASTM C 1077 and ASTM E 329 for testing indicated, as documented according to ASTM E 548.
 - a. Personnel conducting field tests shall be qualified as ACI Concrete Field Testing Technician, Grade 1, according to ACI CP-01 or an equivalent certification program.
 - b. Personnel performing laboratory tests shall be an ACI-certified Concrete Strength Testing Technician and Concrete Laboratory Testing Technician - Grade I. Testing Agency laboratory supervisor shall be an ACI-certified Concrete Laboratory Testing Technician - Grade II.
3. ACI Publications: Comply with the following unless modified by requirements in the Contract Documents:
 - a. ACI 301, "Specification for Structural Concrete," Sections 1 through 5 **OR** Sections 1 through 5 and Section 6, "Architectural Concrete", **as directed**.
 - b. ACI 303.1, "Specification for Cast-in-Place Architectural Concrete."
4. Field Sample Panels: After approval of verification sample and before casting architectural concrete, produce field sample panels to demonstrate the approved range of selections made under sample submittals. Produce a minimum of 3 sets of full-scale panels, cast vertically, approximately **48 by 48 by 6 inches (1200 by 1200 by 150 mm)** minimum, to demonstrate the expected range of finish, color, and texture variations.
5. Preinstallation Conference: Conduct conference at Project site.

1.2 PRODUCTS

A. Form-Facing Materials

1. General: Comply with Division 03 Section "Cast-in-place Concrete" for formwork and other form-facing material requirements.
2. Form-Facing Panels for As-Cast **OR** Exposed-Aggregate, **as directed**, Finishes: Steel, glass-fiber-reinforced plastic, or other approved nonabsorptive panel materials that will provide continuous, true, and smooth architectural concrete surfaces. Furnish in largest practicable sizes to minimize number of joints.
3. Forms for Cylindrical Columns, Pedestals, and Supports: Metal, glass-fiber-reinforced plastic, paper, or fiber tubes that will provide surfaces with gradual or abrupt irregularities not exceeding specified formwork surface class. Provide units with sufficient wall thickness to resist plastic concrete loads without detrimental deformation.
4. Pan-Type Forms: Glass-fiber-reinforced plastic or formed steel, stiffened to resist plastic concrete loads without detrimental deformation.
5. Form Liners: Units of face design, texture, arrangement, and configuration indicated **OR** to match design reference sample, **as directed**. Furnish with manufacturer's recommended liquid-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent surface treatments of concrete.
6. Rustication Strips: Metal, rigid plastic, or dressed wood with sides beveled and back kerfed; nonstaining; in longest practicable lengths.
7. Chamfer Strips: Metal, rigid plastic, elastomeric rubber, or dressed wood, **3/4 by 3/4 inch (19 by 19 mm)**, minimum; nonstaining; in longest practicable lengths.
8. Form Joint Tape: Compressible foam tape; pressure sensitive; AAMA 800, "Specification 810.1, Expanded Cellular Glazing Tape"; minimum **1/4 inch (6 mm)** thick.
9. Form Joint Sealant: Elastomeric sealant complying with ASTM C 920, Type M or S, Grade NS, that adheres to form joint substrates.
10. Sealer: Penetrating, clear, polyurethane wood form sealer formulated to reduce absorption of bleed water and prevent migration of set-retarding chemicals from wood.

11. Form-Release Agent: Commercially formulated colorless form-release agent that will not bond with, stain, or adversely affect architectural concrete surfaces and will not impair subsequent treatments of those surfaces.
 - a. Formulate form-release agent with rust inhibitor for steel form-facing materials.
 12. Surface Retarder: Chemical liquid set retarder, for application on form-facing materials, capable of temporarily delaying final hardening of newly placed concrete surface to depth of reveal specified.
 13. Form Ties: Factory-fabricated, glass-fiber-reinforced plastic **OR** internally disconnecting **OR** removable, **as directed**, ties designed to resist lateral pressure of fresh concrete on forms and to prevent spalling of concrete on removal.
 - a. Furnish ties with tapered tie cone spreaders, **as directed**, that, when removed, will leave holes **3/4 inch (19 mm) OR 1 inch (25 mm) OR 1-1/4 inches (32 mm) OR 1-1/2 inches (38 mm)**, **as directed**, in diameter on concrete surface.
 - b. Furnish internally disconnecting ties that will leave no metal closer than **1-1/2 inches (38 mm)**, after exposing aggregate, **as directed**, from the architectural concrete surface.
 - c. Furnish glass-fiber-reinforced plastic ties, not less than **1/2 inch (13 mm)** in diameter, of color to match the Owner's sample **OR** selected by the Owner from manufacturer's full range, **as directed**.
 - d. Furnish ties with integral water-barrier plates to walls indicated to receive dampproofing or waterproofing.
- B. Steel Reinforcement And Accessories
1. General: Comply with Division 03 Section "Cast-in-place Concrete" for steel reinforcement and other requirements for reinforcement accessories.
 2. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than **25 OR 60, as directed**, percent.
 3. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded-wire fabric in place; manufacture according to CRSI's "Manual of Standard Practice."
 - a. Where legs of wire bar supports contact forms, use gray, all-plastic **OR** CRSI Class 1, gray, plastic-protected **OR** CRSI Class 2, stainless-steel, **as directed**, bar supports.
- C. Concrete Materials
1. Cementitious Material: Use the following cementitious materials, of the same type, brand, and source, throughout Project:
 - a. Portland Cement: ASTM C 150, Type I **OR** II **OR** I/II **OR** III, **as directed**, gray **OR** white, **as directed**. Supplement with the following:
 - 1) Fly Ash: ASTM C 618, Class C **OR** F, **as directed**.
 - 2) Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
 - 3) Silica Fume: ASTM C 1240, amorphous silica.
 - b. Blended Hydraulic Cement: ASTM C 595, Type IS, portland blast-furnace slag **OR** IP, portland-pozzolan **OR** (PM), pozzolan-modified Portland **OR** I (SM), slag-modified Portland, **as directed**, cement.
 2. Normal-Weight Aggregates: ASTM C 33, Class 5S **OR** 5M **OR** 1N, **as directed**, coarse aggregate or better, graded. Provide aggregates from a single source with documented service record data of at least 10 years' satisfactory service in similar applications and service conditions using similar aggregates and cementitious materials, **as directed**.
 - a. Maximum Coarse Aggregate Size: **1 inch (25 mm) OR 3/4 inch (19 mm) OR 1/2 inch (13 mm) OR 3/8 inch (10 mm)**, **as directed**.
 - b. Gradation: Uniformly **OR** Gap, **as directed**, graded.
 3. Normal-Weight Fine Aggregate: ASTM C 33 **OR** ASTM C 144, **as directed**, manufactured or natural sand, from same source for entire Project.
 4. Water: Potable, complying with ASTM C 94/C 94M except free of wash water from mixer washout operations.

D. Admixtures

1. Air-Entraining Admixture: ASTM C 260.
2. Chemical Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures and that will not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.
 - a. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 - b. Retarding Admixture: ASTM C 494/C 494M, Type B.
 - c. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 - d. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
 - e. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
 - f. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.
3. Color Pigment: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures; color stable, free of carbon black, **as directed**, nonfading, and resistant to lime and other alkalis.
 - a. Color: As indicated by manufacturer's designation **OR** Match the Owner's sample **OR** As selected by the Owner from manufacturer's full range, **as directed**.

E. Curing Materials

1. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately **9 oz./sq. yd. (305 g/sq. m)** when dry.
2. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
3. Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B.
 - a. For integrally colored concrete, curing compound shall be pigmented type, **as directed**, approved by color pigment manufacturer.
 - b. For concrete indicated to be sealed, curing compound shall be compatible with sealer.

F. Repair Materials

1. Bonding Agent: ASTM C 1059, Type II, nonredispersible, acrylic emulsion or styrene butadiene.
2. Epoxy Bonding Adhesive: ASTM C 881, two-component epoxy resin, capable of humid curing and bonding to damp surfaces, of class suitable for application temperature and of grade to suit requirements.
 - a. Types I and II, non-load bearing **OR** IV and V, load bearing, **as directed**, for bonding hardened or freshly mixed concrete to hardened concrete.

G. Concrete Mixtures, General

1. Prepare design mixtures for each type and strength of cast-in-place architectural concrete proportioned on basis of laboratory trial mixture or field test data, or both, according to ACI 301.
 - a. Use a qualified independent testing agency for preparing and reporting proposed design mixtures based on laboratory trial mixtures.
2. Proportion concrete mixtures as follows:
 - a. Compressive Strength (28 Days): **5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa), as directed.**
 - b. Maximum Water-Cementitious Materials Ratio: 0.46.
 - c. Slump Limit: **3 inches (75 mm) OR 4 inches (100 mm) OR 8 inches (200 mm)** for concrete with verified slump of **2 to 4 inches (50 to 100 mm)** before adding high-range water-reducing admixture or plasticizing admixture, **as directed**, plus or minus **1 inch (25 mm)**.
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for **1-1/2-inch (38-mm)** nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for **1-inch (25-mm) OR 3/4-inch (19-mm), as directed**, nominal maximum aggregate size.
3. Cementitious Materials: For cast-in-place architectural concrete exposed to deicers, limit percentage, by weight, of cementitious materials other than portland cement according to ACI 301 requirements. Use fly ash, pozzolan, ground granulated blast-furnace slag, and silica

- fume as needed to reduce the total amount of portland cement, which would otherwise be used, by not less than 40 percent, **as directed**.
4. Limit water-soluble, chloride-ion content in hardened concrete to 0.06 **OR** 0.15 **OR** 0.30 **OR** 1.00, **as directed**, percent by weight of cement.
 5. Admixtures: Use admixtures according to manufacturer's written instructions.
 6. Color Pigment: Add color pigment to concrete mixture according to manufacturer's written instructions and to result in hardened concrete color consistent with approved mockup.
- H. Concrete Mixing
1. Ready-Mixed or Site-Mixed Architectural Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94/C 94M and furnish batch ticket information.
 - a. Clean equipment used to mix and deliver cast-in-place architectural concrete to prevent contamination from other concrete.
 - b. When air temperature is between **85 and 90 deg F (30 and 32 deg C)**, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above **90 deg F (32 deg C)**, reduce mixing and delivery time to 60 minutes.

1.3 EXECUTION

A. Formwork

1. General: Comply with Division 03 Section "Cast-in-place Concrete" for formwork, embedded items, and shoring and reshoring.
2. Limit deflection of form-facing panels to not exceed ACI 303.1 requirements.
3. In addition to ACI 303.1 limits on form-facing panel deflection, limit cast-in-place architectural concrete surface irregularities, designated by ACI 347R as abrupt or gradual, as follows:
 - a. Class A, **1/8 inch (3.2 mm) OR B, 1/4 inch (6 mm) OR C, 1/2 inch (13 mm)**, **as directed**.
4. Fabricate forms to result in cast-in-place architectural concrete that complies with ACI 117, "Specifications for Tolerances for Concrete Construction and Materials."
 - a. In addition to ACI 117, comply with additional tolerances as directed by the Owner.
5. Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where stripping may damage cast-in-place surfaces. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical. Kerf wood rustications, keyways, reglets, recesses, and the like, for easy removal.
 - a. Seal form joints and penetrations at form ties with form joint tape or form joint sealant to prevent cement paste leakage.
 - b. Do not use rust-stained steel form-facing material.
6. Provide temporary openings for cleanouts and inspection ports where interior area of formwork is inaccessible. Close openings with panels tightly fitted to forms and securely braced to prevent loss of concrete mortar. Locate temporary openings in forms at inconspicuous locations.
7. Chamfer **OR** Do not chamfer, **as directed**, exterior corners and edges of cast-in-place architectural concrete.
8. Coat contact surfaces of wood rustications and chamfer strips with sealer before placing reinforcement, anchoring devices, and embedded items.
9. Form openings, chases, offsets, sinkages, keyways, reglets, blocking, screeds, and bulkheads required in the Work. Determine sizes and locations from trades providing such items.
10. Clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before placing concrete.
11. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.
12. Coat contact surfaces of forms with form-release agent, according to manufacturer's written instructions, before placing reinforcement.
13. Coat contact surfaces of forms with surface retarder, according to manufacturer's written instructions, before placing reinforcement.
14. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and attach securely to prevent deflection and maintain stability of liners during concreting.

Prevent form liners from sagging and stretching in hot weather. Seal joints of form liners and form liner accessories to prevent mortar leaks. Coat form liner with form-release agent.

B. Reinforcement And Inserts

1. General: Comply with Division 03 Section "Cast-in-place Concrete" for fabricating and installing steel reinforcement. Securely fasten steel reinforcement and wire ties against shifting during concrete placement.
2. Set wire ties with ends directed into concrete, not toward exposed concrete surfaces.

C. Removing And Reusing Forms

1. Formwork for sides of beams, walls, columns, and similar parts of the Work that does not support weight of concrete may be removed after cumulatively curing at not less than 50 deg F (10 deg C) for 24 hours after placing concrete, if concrete is hard enough to not be damaged by form-removal operations and curing and protection operations are maintained.
 - a. Schedule form removal to maintain surface appearance that matches approved field sample panels.
 - b. Cut off and grind glass-fiber-reinforced plastic form ties flush with surface of concrete.
2. Leave formwork for beam soffits, joists, slabs, and other structural elements that support weight of concrete in place until concrete has achieved 28-day design compressive strength **OR** at least 70 percent of 28-day design compressive strength, **as directed**. Remove forms only if shores have been arranged to permit removal of forms without loosening or disturbing shores.
3. Clean and repair surfaces of forms to be reused in the Work. Do not use split, frayed, delaminated, or otherwise damaged form-facing material. Apply new form-release agent.
4. When forms are reused, clean surfaces, remove fins and laitance, and tighten to close joints. Align and secure joints to avoid offsets. Do not use patched forms for cast-in-place architectural concrete surfaces.

D. Joints

1. Construction Joints: Install construction joints true to line with faces perpendicular to surface plane of cast-in-place architectural concrete so strength and appearance of concrete are not impaired, at locations indicated or as approved by the Owner.
 - a. Place joints perpendicular to main reinforcement. Continue reinforcement across construction joints, unless otherwise indicated.
 - b. Form keyed joints as indicated. Embed keys at least 1-1/2 inches (38 mm) into concrete, **as directed**. Align construction joint within rustications attached to form-facing material.
 - c. Locate joints for beams, slabs, joists, and girders in the middle third of spans. Offset joints in girders a minimum distance of twice the beam width from a beam-girder intersection.
 - d. Locate horizontal joints in walls and columns at underside of floors, slabs, beams, and girders and at the top of footings or floor slabs.
 - e. Space vertical joints in walls as indicated. Locate joints beside piers integral with walls, near corners, and in concealed locations where possible.
 - f. Use bonding agent **OR** epoxy-bonding adhesive, **as directed**, at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
2. Contraction Joints: Form weakened-plane contraction joints true to line with faces perpendicular to surface plane of cast-in-place architectural concrete so strength and appearance of concrete are not impaired, at locations indicated or as approved by the Owner.

E. Concrete Placement

1. Before placing concrete, verify that installation of formwork, form-release agent, reinforcement, and embedded items is complete and that required inspections have been performed.
2. Do not add water to concrete during delivery, at Project site, or during placement unless approved by the Owner.
3. Before test sampling and placing concrete, water may be added at Project site, subject to limitations of ACI 301.

- a. Do not add water to concrete after adding high-range water-reducing admixtures to mixture.
 4. Deposit concrete continuously between construction joints. Deposit concrete to avoid segregation.
 - a. Deposit concrete in horizontal layers of depth to not exceed formwork design pressures and in a manner to avoid inclined construction joints.
 - b. Consolidate placed concrete with mechanical vibrating equipment according to ACI 303.1.
 - c. Do not use vibrators to transport concrete inside forms. Insert and withdraw vibrators vertically at uniformly spaced locations to rapidly penetrate placed layer and at least **6 inches (150 mm)** into preceding layer. Do not insert vibrators into lower layers of concrete that have begun to lose plasticity. Do not permit vibrators to contact forms.
 5. Cold-Weather Placement: Comply with ACI 306.1 and as follows. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.
 - a. When average high and low temperature is expected to fall below **40 deg F (4.4 deg C)** for three successive days, maintain delivered concrete mixture temperature within the temperature range required by ACI 301.
 - b. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
 - c. Do not use calcium chloride, salt, or other materials containing antifreeze agents.
 - d. Do not use chemical accelerators unless otherwise specified and approved in design mixtures.
 6. Hot-Weather Placement: Comply with ACI 301 and as follows:
 - a. Maintain concrete temperature below **90 deg F (32 deg C)** at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
 - b. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade uniformly moist without standing water, soft spots, or dry areas.
- F. Finishes, General
 1. Architectural Concrete Finish: Match the Owner's design reference sample, identified and described as indicated, to satisfaction of the Owner.
 2. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces.
 - a. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces, unless otherwise indicated.
 3. Maintain uniformity of special finishes over construction joints, unless otherwise indicated.
- G. As-Cast Formed Finishes
 1. Rough-Formed Finish: As-cast concrete texture imparted by form-facing material with tie holes and defects repaired and patched. Remove fins and other projections exceeding specified limits on formed-surface irregularities.
 2. Smooth-Formed Finish: As-cast concrete texture imparted by form-facing material, arranged in an orderly and symmetrical manner with a minimum of seams. Remove fins and other projections exceeding specified limits on formed-surface irregularities. Repair **OR** Do not repair, **as directed**, and patch tie holes and defects.
 3. Rubbed Finish: Apply the following to smooth-form-finished as-cast concrete where indicated:
 - a. Smooth-Rubbed Finish: Not later than one day after form removal, moisten concrete surfaces and rub with carborundum brick or another abrasive until producing a uniform color and texture. Do not apply cement grout other than that created by the rubbing process.
 - b. Grout-Cleaned Finish: Wet concrete surfaces and apply grout of a consistency of thick paint to coat surfaces and fill small holes. Mix one part portland cement to one and one-half parts fine sand with a 1:1 mixture of bonding admixture and water. Add white portland

cement in amounts determined by trial patches so color of dry grout will match surrounding concrete. Scrub grout into voids and remove excess grout. When grout whitens, rub surface with clean burlap and keep surface damp by fog spray for at least 36 hours.

- c. Cork-Floated Finish: Wet concrete surfaces and apply a stiff grout. Mix one part portland cement and one part fine sand with a 1:1 mixture of bonding agent and water. Add white portland cement in amounts determined by trial patches so color of dry grout will match surrounding concrete. Compress grout into voids by grinding surface. In a swirling motion, finish surface with a cork float.
4. Form-Liner Finish: Produce a textured surface free of pockets, streaks, and honeycombs, and of uniform appearance, color, and texture.

H. Exposed-Aggregate Finishes

1. Scrubbed Finish: After concrete has achieved a compressive strength of from **1000 to 1500 psi (6.9 to 10.3 MPa)**, apply scrubbed finish. Wet concrete surfaces thoroughly and scrub with stiff fiber or wire brushes, using water freely, until top mortar surface is removed and aggregate is uniformly exposed. Rinse scrubbed surfaces with clean water. Maintain continuity of finish on each surface or area of Work. Remove only enough concrete mortar from surfaces to match design reference sample.
2. High-Pressure Water-Jet Finish: Perform high-pressure water jetting on concrete that has achieved a minimum compressive strength of **4500 psi (31 MPa)**. Coordinate with formwork removal to ensure that surfaces to be high-pressure water-jet finished are treated at same age for uniform results.
 - a. Surface Continuity: Perform high-pressure water-jet finishing in as continuous an operation as possible, maintaining continuity of finish on each surface or area of Work. Maintain required patterns or variances in reveal projection to match design reference sample.
3. Abrasive-Blast Finish: Perform abrasive blasting after compressive strength of concrete exceeds **2000 psi (13.8 MPa)**. Coordinate with formwork removal to ensure that surfaces to be abrasive blasted are treated at same age for uniform results.
 - a. Surface Continuity: Perform abrasive-blast finishing in as continuous an operation as possible, maintaining continuity of finish on each surface or area of Work. Maintain required patterns or variances in depths of blast to match design reference sample.
 - b. Abrasive Blasting: Abrasive blast corners and edges of patterns carefully, using backup boards, to maintain uniform corner or edge line. Determine type of nozzle, nozzle pressure, and blasting techniques required to match design reference sample.
 - c. Depth of Cut: Use an abrasive grit of proper type and gradation to expose aggregate and surrounding matrix surfaces to match design reference sample, as follows:
 - 1) Brush: Remove cement matrix to dull surface sheen and expose face of fine aggregate; with no significant reveal.
 - 2) Light: Expose fine aggregate with occasional exposure of coarse aggregate and uniform color; with maximum reveal of **1/16 inch (1.5 mm)**.
 - 3) Medium: Generally expose coarse aggregate; with slight reveal, a maximum of **1/4 inch (6 mm)**.
 - 4) Heavy: Expose and reveal coarse aggregate to a maximum projection of one-third its diameter; with reveal range of **1/4 to 1/2 inch (6 to 13 mm)**.
4. Bushhammer Finish: Allow concrete to cure at least 14 days before starting bushhammer surface finish operations.
 - a. Surface Continuity: Perform bushhammer finishing in as continuous an operation as possible, maintaining continuity of finish on each surface or area of Work. Maintain required patterns or variances of cut as shown on Drawings or to match design reference sample or mockup.
 - b. Surface Cut: Maintain required depth of cut and general aggregate exposure. Use power tool with hammer attachments for large, flat surfaces, and use hand hammers for small areas, at corners and edges, and for restricted locations where power tools cannot reach.
 - c. Remove impressions of formwork and form facings with exception of tie holes.

- I. Concrete Protecting And Curing
 - 1. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and with ACI 301 for hot-weather protection during curing.
 - 2. Begin curing cast-in-place architectural concrete immediately after removing forms from **OR** applying as-cast formed finishes to, **as directed**, concrete. Cure according to ACI 308.1, by one or a combination of the following methods that will not mottle, discolor, or stain concrete:
 - a. Moisture Curing: Keep exposed surfaces of cast-in-place architectural concrete continuously moist for not less than seven days with the following materials:
 - 1) Water.
 - 2) Continuous water-fog spray.
 - 3) Absorptive cover, water saturated and kept continuously wet. Cover concrete surfaces and edges with **12-inch (300-mm)** lap over adjacent absorptive covers.
 - b. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least **12 inches (300 mm)**, and sealed by waterproof tape or adhesive. Cure for not less than seven days. Immediately repair any holes or tears during curing period; use cover material and waterproof tape.
 - c. Curing Compound: Mist concrete surfaces with water. Apply curing compound uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.
- J. Field Quality Control
 - 1. General: Comply with Division 03 Section "Cast-in-place Concrete" for field quality-control requirements.
- K. Repairs, Protection, And Cleaning
 - 1. Repair and cure damaged finished surfaces of cast-in-place architectural concrete when approved by the Owner. Match repairs to color, texture, and uniformity of surrounding surfaces and to repairs on approved mockups.
 - a. Remove and replace cast-in-place architectural concrete that cannot be repaired and cured to the Owner's approval.
 - 2. Protect corners, edges, and surfaces of cast-in-place architectural concrete from damage; use guards and barricades.
 - 3. Protect cast-in-place architectural concrete from staining, laitance, and contamination during remainder of construction period.
 - 4. Clean cast-in-place architectural concrete surfaces after finish treatment to remove stains, markings, dust, and debris.
 - 5. Wash and rinse surfaces according to concrete finish applicator's written recommendations. Protect other Work from staining or damage due to cleaning operations.
 - a. Do not use cleaning materials or processes that could change the appearance of cast-in-place architectural concrete finishes.

SECTION 03 11 16 13 - RUSTICATED CONCRETE FINISHES

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of rusticated concrete finishes. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.
2. Sample: A sample of finish expected shall be erected on site. Completed work shall approximate the sample. Work determined by the contracting officer not to be similar shall be removed and replaced without further expense to the Owner.

1.2 PRODUCTS

- A. Overlaid Plywood: DOC PS 1, B-B High Density Overlaid Concrete Form, Class I.
- B. Plywood: DOC PS 1, B-B (Concrete Form) Plywood, Class I, Exterior Grade or better, mill-oiled and edge-sealed, with each piece bearing legible inspection mark.
- C. Chamfer Strips: Clear white pine with surface against concrete to be planed, metal, PVC, or rubber.
- D. Form Liners: Provide commercially available molds and form-facing materials of metal, plastic, mood, or another material that is nonreactive with concrete and dimensionally stable to produce repetitive concrete surfaces.

1.3 EXECUTION

- A. Form Construction: Forms shall be constructed to provide required sizes, shapes, lines, and dimensions and to provide continuous, straight, smooth exposed surfaces. Forms shall be fabricated for easy removal without hammering or prying against concrete surfaces. The number of joints shall be minimized. Joints shall be made watertight to prevent leakage of cement paste. Provisions shall be made for openings, offsets, sinkages, keyways, recesses, moldings, rustications, reglets, chamfers, blocking, inserts, and other features required in the work.
- B. Form Coatings: Forms shall be oiled with form-coating compounds that will not bond with, stain, nor adversely effect concrete surfaces, and will not impair subsequent treatments of concrete surfaces.
- C. Finish: Fins and other projections shall be completely removed and smoothed. A smooth rubbed finish shall be provided not less than one day after form removal.

SECTION 03 30 00 00 - CAST-IN-PLACE CONCRETE

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for cast-in-place concrete. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section specifies cast-in place concrete, including formwork, reinforcement, concrete materials, mixture design, placement procedures, and finishes, for the following:
 - a. Footings.
 - b. Foundation walls.
 - c. Slabs-on-grade.
 - d. Suspended slabs.
 - e. Concrete toppings.
 - f. Building frame members.
 - g. Building walls.

C. Definitions

1. Cementitious Materials: Portland cement alone or in combination with one or more of the following: blended hydraulic cement, fly ash and other pozzolans, ground granulated blast-furnace slag, and silica fume; subject to compliance with requirements.

D. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittals:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - 1) Include statement indicating costs for each product having recycled content.
 - b. Design Mixtures for Credit ID 1.1: For each concrete mixture containing fly ash as a replacement for portland cement or other portland cement replacements and for equivalent concrete mixtures that do not contain portland cement replacements.
3. Design Mixtures: For each concrete mixture.
4. Shop Drawings: For steel reinforcement and formwork. Material test reports **OR** certificates, **as directed**.

E. Quality Assurance

1. Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.
 - a. Manufacturer certified according to NRMCA's "Certification of Ready Mixed Concrete Production Facilities."
2. Testing Agency Qualifications: An independent agency, acceptable to authorities having jurisdiction, **as directed**, qualified according to ASTM C 1077 and ASTM E 329 for testing indicated, as documented according to ASTM E 548.
3. ACI Publications: Comply with the following unless modified by requirements in the Contract Documents:
 - a. ACI 301, "Specification for Structural Concrete," Sections 1 through 5 **OR** Sections 1 through 5 and Section 7, "Lightweight Concrete", **as directed**.
 - b. ACI 117, "Specifications for Tolerances for Concrete Construction and Materials."
4. Concrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design concrete mixtures.

5. Preinstallation Conference: Conduct conference at Project site.

F. Delivery, Storage, And Handling

1. Steel Reinforcement: Deliver, store, and handle steel reinforcement to prevent bending and damage. Avoid damaging coatings on steel reinforcement, **as directed**.
2. Waterstops: Store waterstops under cover to protect from moisture, sunlight, dirt, oil, and other contaminants.

1.2 PRODUCTS

A. Form-Facing Materials

1. Smooth-Formed Finished Concrete: Form-facing panels that will provide continuous, true, and smooth concrete surfaces. Furnish in largest practicable sizes to minimize number of joints.
2. Rough-Formed Finished Concrete: Plywood, lumber, metal, or another approved material. Provide lumber dressed on at least two edges and one side for tight fit.
3. Forms for Cylindrical Columns, Pedestals, and Supports: Metal, glass-fiber-reinforced plastic, paper, or fiber tubes that will produce surfaces with gradual or abrupt irregularities not exceeding specified formwork surface class. Provide units with sufficient wall thickness to resist plastic concrete loads without detrimental deformation.
4. Pan-Type Forms: Glass-fiber-reinforced plastic or formed steel, stiffened to resist plastic concrete loads without detrimental deformation.
5. Void Forms: Biodegradable paper surface, treated for moisture resistance, structurally sufficient to support weight of plastic concrete and other superimposed loads.
6. Chamfer Strips: Wood, metal, PVC, or rubber strips, **3/4 by 3/4 inch (19 by 19 mm)**, minimum.
7. Rustication Strips: Wood, metal, PVC, or rubber strips, kerfed for ease of form removal.
8. Form-Release Agent: Commercially formulated form-release agent that will not bond with, stain, or adversely affect concrete surfaces and will not impair subsequent treatments of concrete surfaces.
 - a. Formulate form-release agent with rust inhibitor for steel form-facing materials.
9. Form Ties: Factory-fabricated, removable or snap-off metal or glass-fiber-reinforced plastic form ties designed to resist lateral pressure of fresh concrete on forms and to prevent spalling of concrete on removal.
 - a. Furnish units that will leave no corrodible metal closer than **1 inch (25 mm)** to the plane of exposed concrete surface.
 - b. Furnish ties that, when removed, will leave holes no larger than **1 inch (25 mm)** in diameter in concrete surface.
 - c. Furnish ties with integral water-barrier plates to walls indicated to receive dampproofing or waterproofing.

B. Steel Reinforcement

1. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than **25 OR 60, as directed**, percent.
2. Reinforcing Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420)**, deformed.
3. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M, deformed.
4. Galvanized Reinforcing Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420) OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 767/A 767M, Class I **OR** II, **as directed**, zinc coated after fabrication and bending.
5. Epoxy-Coated Reinforcing Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420) OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 775/A 775M **OR** ASTM A 934/A 934M, **as directed**, epoxy coated, with less than 2 percent damaged coating in each **12-inch (300-mm)** bar length.
6. Stainless-Steel Reinforcing Bars: ASTM A 955/A 955M, **Grade 60 (Grade 420)**, Type 304 **OR** 316L, **as directed**, deformed.

7. Steel Bar Mats: ASTM A 184/A 184M, fabricated from ASTM A 615/A 615M, **Grade 60 (Grade 420) OR** ASTM A 706/A 706M, **as directed**, deformed bars, assembled with clips.
 8. Plain-Steel Wire: ASTM A 82, as drawn **OR** galvanized, **as directed**.
 9. Deformed-Steel Wire: ASTM A 496.
 10. Epoxy-Coated Wire: ASTM A 884/A 884M, Class A, Type 1 coated, as-drawn, plain-steel-wire **OR** deformed-steel wire, **as directed**, with less than 2 percent damaged coating in each **12-inch (300-mm)** wire length.
 11. Plain-Steel Welded Wire Reinforcement: ASTM A 1064, plain, fabricated from as-drawn steel wire into flat sheets.
 12. Deformed-Steel Welded Wire Reinforcement: ASTM A 497, flat sheet.
 13. Galvanized-Steel Welded Wire Reinforcement: ASTM A 1064, plain, fabricated from galvanized steel wire into flat sheets.
 14. Epoxy-Coated Welded Wire Reinforcement: ASTM A 884/A 884M, Class A coated, Type 1, plain **OR** deformed, **as directed**, steel.
- C. Reinforcement Accessories
1. Joint Dowel Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420)**, plain-steel bars, cut bars true to length with ends square and free of burrs.
 2. Epoxy-Coated Joint Dowel Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420)**, plain-steel bars, ASTM A 775/A 775M epoxy coated.
 3. Epoxy Repair Coating: Liquid, two-part, epoxy repair coating; compatible with epoxy coating on reinforcement and complying with ASTM A 775/A 775M.
 4. Zinc Repair Material: ASTM A 780, zinc-based solder, paint containing zinc dust, or sprayed zinc.
 5. Bar Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire reinforcement in place. Manufacture bar supports from steel wire, plastic, or precast concrete according to CRSI's "Manual of Standard Practice," of greater compressive strength than concrete and as follows:
 - a. For concrete surfaces exposed to view where legs of wire bar supports contact forms, use CRSI Class 1 plastic-protected steel wire or CRSI Class 2 stainless-steel bar supports.
 - b. For epoxy-coated reinforcement, use epoxy-coated or other dielectric-polymer-coated wire bar supports.
 - c. For zinc-coated reinforcement, use galvanized wire or dielectric-polymer-coated wire bar supports.
- D. Concrete Materials
1. Cementitious Material: Use the following cementitious materials, of the same type, brand, and source, throughout Project:
 - a. Portland Cement: ASTM C 150, Type I **OR** II **OR** I/II **OR** III **OR** V, **as directed**, gray **OR** white, **as directed**. Supplement with the following:
 - 1) Fly Ash: ASTM C 618, Class C **OR** F, **as directed**.
 - 2) Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
 - b. Blended Hydraulic Cement: ASTM C 595, Type IS, portland blast-furnace slag **OR** IP, portland-pozzolan **OR** I (PM), pozzolan-modified portland **OR** I (SM), slag-modified Portland, **as directed**, cement.
 2. Silica Fume: ASTM C 1240, amorphous silica.
 3. Normal-Weight Aggregates: ASTM C 33, graded, **1-1/2-inch (38-mm) OR 1-inch (25-mm) OR 3/4-inch (19-mm)**, **as directed**, nominal maximum coarse-aggregate size.
 - a. Fine Aggregate: Free of materials with deleterious reactivity to alkali in cement.
 4. Lightweight Aggregate: ASTM C 330, **1-inch (25-mm) OR 3/4-inch (19-mm) OR 1/2-inch (13-mm) OR 3/8-inch (10-mm)**, **as directed**, nominal maximum aggregate size.
 5. Water: ASTM C 94/C 94M and potable, **as directed**.
- E. Admixtures
1. Air-Entraining Admixture: ASTM C 260.

2. Chemical Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures and that will not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.
 - a. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 - b. Retarding Admixture: ASTM C 494/C 494M, Type B.
 - c. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 - d. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
 - e. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
 - f. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.
 3. Set-Accelerating Corrosion-Inhibiting Admixture: Commercially formulated, anodic inhibitor or mixed cathodic and anodic inhibitor; capable of forming a protective barrier and minimizing chloride reactions with steel reinforcement in concrete and complying with ASTM C 494/C 494M, Type C.
 4. Non-Set-Accelerating Corrosion-Inhibiting Admixture: Commercially formulated, non-set-accelerating, anodic inhibitor or mixed cathodic and anodic inhibitor; capable of forming a protective barrier and minimizing chloride reactions with steel reinforcement in concrete.
 5. Color Pigment: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures; color stable, free of carbon black, **as directed**, nonfading, and resistant to lime and other alkalis.
 - a. Color: As indicated by manufacturer's designation **OR** Match the Owner's sample **OR** As selected by the Owner from manufacturer's full range, **as directed**.
- F. Fiber Reinforcement
1. Carbon-Steel Fiber: ASTM A 820, deformed, minimum of **1.5 inches (38 mm) OR 2 inches (50 mm) OR 2.4 inches (60 mm)**, **as directed**, long, and aspect ratio of 35 to 40 **OR** 45 to 50 **OR** 60 to 65, **as directed**.
 - a. Fiber: Type 1, cold-drawn wire **OR** 2, cut sheet, **as directed**.
 2. Synthetic Micro-Fiber: Monofilament or fibrillated polypropylene micro-fibers engineered and designed for use in concrete, complying with ASTM C 1116/ C 1116M , Type III, **1/2 to 1-1/2 inches (13 to 38 mm) OR 1 to 2-1/4 inches (25 to 57 mm)** long.
 3. Synthetic Macro-Fiber: Polyolefin macro-fibers engineered and designed for use in concrete, complying with ASTM C 1116/C 1116M, Type III, **1 to 2-1/4 inches (25 to 57 mm)** long.
- G. Waterstops
1. Flexible Rubber Waterstops: CE CRD-C 513, with factory-installed metal eyelets, **as directed**, for embedding in concrete to prevent passage of fluids through joints. Factory fabricate corners, intersections, and directional changes.
 - a. Profile: Flat, dumbbell with center bulb **OR** Flat, dumbbell without center bulb **OR** Ribbed with center bulb **OR** Ribbed without center bulb **OR** As indicated, **as directed**.
 - b. Dimensions: **4 inches by 3/16 inch thick (100 mm by 4.75 mm thick) OR 6 inches by 3/8 inch thick (150 mm by 10 mm thick) OR 9 inches by 3/8 inch thick (225 mm by 10 mm thick)**, **as directed**; nontapered.
 2. Chemically Resistant Flexible Waterstops: Thermoplastic elastomer rubber waterstops with factory-installed metal eyelets, **as directed**, for embedding in concrete to prevent passage of fluids through joints; resistant to oils, solvents, and chemicals. Factory fabricate corners, intersections, and directional changes.
 - a. Profile: Flat, dumbbell with center bulb **OR** Flat, dumbbell without center bulb **OR** Ribbed with center bulb **OR** Ribbed without center bulb **OR** As indicated, **as directed**.
 - b. Dimensions: **4 inches by 3/16 inch thick (100 mm by 4.75 mm thick) OR 6 inches by 3/16 inch thick (150 mm by 4.75 mm thick) OR 6 inches by 3/8 inch thick (150 mm by 10 mm thick) OR 9 inches by 3/16 inch thick (225 mm by 4.75 mm thick) OR 9 inches by 3/8 inch thick (225 mm by 10 mm thick)**, **as directed**; nontapered.
 3. Flexible PVC Waterstops: CE CRD-C 572, with factory-installed metal eyelets, **as directed**, for embedding in concrete to prevent passage of fluids through joints. Factory fabricate corners, intersections, and directional changes.

- a. Profile: Flat, dumbbell with center bulb **OR** Flat, dumbbell without center bulb **OR** Ribbed with center bulb **OR** Ribbed without center bulb **OR** As indicated, **as directed**.
 - b. Dimensions: **4 inches by 3/16 inch thick (100 mm by 4.75 mm thick) OR 6 inches by 3/8 inch thick (150 mm by 10 mm thick) OR 9 inches by 3/8 inch thick (225 mm by 10 mm thick), as directed**; nontapered.
 4. Self-Expanding Butyl Strip Waterstops: Manufactured rectangular or trapezoidal strip, butyl rubber with sodium bentonite or other hydrophilic polymers, for adhesive bonding to concrete, **3/4 by 1 inch (19 by 25 mm)**.
 5. Self-Expanding Rubber Strip Waterstops: Manufactured rectangular or trapezoidal strip, bentonite-free hydrophilic polymer modified chloroprene rubber, for adhesive bonding to concrete, **3/8 by 3/4 inch (10 by 19 mm)**.
- H. Vapor Retarders
1. Plastic Vapor Retarder:
 - a. ASTM E 1745, Class A. Include manufacturer's recommended adhesive or pressure-sensitive tape.
 - b. ASTM E 1745, Class B. Include manufacturer's recommended adhesive or pressure-sensitive tape.
 - c. ASTM E 1745, Class C, or polyethylene sheet, ASTM D 4397, not less than **10 mils (0.25 mm) thick, as directed**. Include manufacturer's recommended adhesive or pressure-sensitive joint tape.
 2. Bituminous Vapor Retarder: **110-mil- (2.8-mm-)** thick, semiflexible, 7-ply sheet membrane consisting of reinforced core and carrier sheet with fortified asphalt layers, protective weathercoating, and removable plastic release liner. Furnish manufacturer's accessories including bonding asphalt, pointing mastics, and self-adhering joint tape.
 - a. Water-Vapor Permeance: **0.00 grains/h x sq. ft. x inches Hg (0.00 ng/Pa x s x sq. m)**; ASTM E 154.
 - b. Tensile Strength: **140 lbf/in. (24.5 kN/m)**; ASTM E 154.
 - c. Puncture Resistance: **90 lbf (400N)**; ASTM E 154.
 3. Granular Fill: Clean mixture of crushed stone or crushed or uncrushed gravel; ASTM D 448, Size 57, with 100 percent passing a **1-1/2-inch (37.5-mm)** sieve and 0 to 5 percent passing a **No. 8 (2.36-mm)** sieve.
 4. Fine-Graded Granular Material: Clean mixture of crushed stone, crushed gravel, and manufactured or natural sand; ASTM D 448, Size 10, with 100 percent passing a **3/8-inch (9.5-mm)** sieve, 10 to 30 percent passing a **No. 100 (0.15-mm)** sieve, and at least 5 percent passing **No. 200 (0.075-mm)** sieve; complying with deleterious substance limits of ASTM C 33 for fine aggregates.
- I. Floor And Slab Treatments
1. Slip-Resistive Emery Aggregate Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive, crushed emery aggregate containing not less than 50 percent aluminum oxide and not less than 20 percent ferric oxide; unaffected by freezing, moisture, and cleaning materials with 100 percent passing **3/8-inch (9.5-mm) OR No. 4 (4.75-mm) OR No. 8 (2.36-mm), as directed**, sieve.
 2. Slip-Resistive Aluminum Granule Finish: Factory-graded, packaged, rustproof, nonglazing, abrasive aggregate of not less than 95 percent fused aluminum-oxide granules.
 3. Emery Dry-Shake Floor Hardener: Pigmented **OR** Unpigmented, **as directed**, factory-packaged, dry combination of portland cement, graded emery aggregate, and plasticizing admixture; with emery aggregate consisting of no less than 60 percent of total aggregate content.
 - a. Color: As indicated by manufacturer's designation **OR** Match the Owner's sample **OR** As selected by the Owner from manufacturer's full range, **as directed**.
 4. Metallic Dry-Shake Floor Hardener: Pigmented **OR** Unpigmented, **as directed**, factory-packaged, dry combination of portland cement, graded metallic aggregate, rust inhibitors, and plasticizing admixture; with metallic aggregate consisting of no less than 65 percent of total aggregate content.

- a. Color: As indicated by manufacturer's designation **OR** Match the Owner's sample **OR** As selected by the Owner from manufacturer's full range, **as directed**.
 5. Unpigmented Mineral Dry-Shake Floor Hardener: Factory-packaged dry combination of portland cement, graded quartz aggregate, and plasticizing admixture.
 6. Pigmented Mineral Dry-Shake Floor Hardener: Factory-packaged, dry combination of portland cement, graded quartz aggregate, color pigments, and plasticizing admixture. Use color pigments that are finely ground, nonfading mineral oxides interground with cement.
 - a. Color: As indicated by manufacturer's designation **OR** Match the Owner's sample **OR** As selected by the Owner from manufacturer's full range, **as directed**.
 7. Penetrating Liquid Floor Treatment: Clear, chemically reactive, waterborne solution of inorganic silicate or silicate materials and proprietary components; odorless; colorless; that penetrates, hardens, and densifies concrete surfaces.
- J. Liquid Floor Treatments
1. Penetrating Liquid Floor Treatment: Clear, chemically reactive, waterborne solution of inorganic silicate or silicate materials and proprietary components; odorless; that penetrates, hardens, and densifies concrete surfaces.
 2. Penetrating Liquid Floor Treatments for Polished Concrete Finish: Clear, waterborne solution of inorganic silicate or silicate materials and proprietary components; odorless; that penetrates, hardens, and is suitable for polished concrete surfaces.
- K. Curing Materials
1. Evaporation Retarder: Waterborne, monomolecular film forming, manufactured for application to fresh concrete.
 2. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately **9 oz./sq. yd. (305 g/sq. m)** when dry.
 3. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
 4. Water: Potable.
 5. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, dissipating.
 6. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, nondissipating, certified by curing compound manufacturer to not interfere with bonding of floor covering, **as directed**.
 7. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B, 18 to 25 percent solids, nondissipating, certified by curing compound manufacturer to not interfere with bonding of floor covering, **as directed**.
 8. Clear, Solvent-Borne, Membrane-Forming Curing and Sealing Compound: ASTM C 1315, Type 1, Class A.
 9. Clear, Waterborne, Membrane-Forming Curing and Sealing Compound: ASTM C 1315, Type 1, Class A.
- L. Related Materials
1. Expansion- and Isolation-Joint-Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber **OR** ASTM D 1752, cork or self-expanding cork, **as directed**.
 2. Semirigid Joint Filler: Two-component, semirigid, 100 percent solids, epoxy resin with a Type A shore durometer hardness of 80 **OR** aromatic polyurea with a Type A shore durometer hardness range of 90 to 95, **as directed**, per ASTM D 2240.
 3. Bonding Agent: ASTM C 1059, Type II, non-redispersible, acrylic emulsion or styrene butadiene.
 4. Epoxy Bonding Adhesive: ASTM C 881, two-component epoxy resin, capable of humid curing and bonding to damp surfaces, of class suitable for application temperature and of grade to suit requirements, and as follows:
 - a. Types I and II, non-load bearing **OR** IV and V, load bearing, **as directed**, for bonding hardened or freshly mixed concrete to hardened concrete.
 5. Reglets: Fabricate reglets of not less than **0.0217-inch- (0.55-mm-)** thick, galvanized steel sheet. Temporarily fill or cover face opening of reglet to prevent intrusion of concrete or debris.

6. Dovetail Anchor Slots: Hot-dip galvanized steel sheet, not less than **0.0336 inch (0.85 mm)** thick, with bent tab anchors. Temporarily fill or cover face opening of slots to prevent intrusion of concrete or debris.
- M. Repair Materials
1. Repair Underlayment: Cement-based, polymer-modified, self-leveling product that can be applied in thicknesses from **1/8 inch (3.2 mm)** and that can be feathered at edges to match adjacent floor elevations.
 - a. Cement Binder: ASTM C 150, portland cement or hydraulic or blended hydraulic cement as defined in ASTM C 219.
 - b. Primer: Product of underlayment manufacturer recommended for substrate, conditions, and application.
 - c. Aggregate: Well-graded, washed gravel, **1/8 to 1/4 inch (3.2 to 6 mm)** or coarse sand as recommended by underlayment manufacturer.
 - d. Compressive Strength: Not less than **4100 psi (29 MPa)** at 28 days when tested according to ASTM C 109/C 109M.
 2. Repair Overlayment: Cement-based, polymer-modified, self-leveling product that can be applied in thicknesses from **1/8 inch (3.2 mm)** and that can be feathered at edges to match adjacent floor elevations.
 - a. Cement Binder: ASTM C 150, portland cement or hydraulic or blended hydraulic cement as defined in ASTM C 219.
 - b. Primer: Product of topping manufacturer recommended for substrate, conditions, and application.
 - c. Aggregate: Well-graded, washed gravel, **1/8 to 1/4 inch (3.2 to 6 mm)** or coarse sand as recommended by topping manufacturer.
 - d. Compressive Strength: Not less than **5000 psi (34.5 MPa)** at 28 days when tested according to ASTM C 109/C 109M.
- N. Concrete Mixtures, General
1. Prepare design mixtures for each type and strength of concrete, proportioned on the basis of laboratory trial mixture or field test data, or both, according to ACI 301.
 - a. Use a qualified independent testing agency for preparing and reporting proposed mixture designs based on laboratory trial mixtures.
 2. Cementitious Materials: Use fly ash, pozzolan, ground granulated blast-furnace slag, and silica fume as needed to reduce the total amount of portland cement, which would otherwise be used, by not less than 40 percent **OR** Limit percentage, by weight, of cementitious materials other than portland cement in concrete as follows, **as directed**
 - a. Fly Ash: 25 percent.
 - b. Combined Fly Ash and Pozzolan: 25 percent.
 - c. Ground Granulated Blast-Furnace Slag: 50 percent.
 - d. Combined Fly Ash or Pozzolan and Ground Granulated Blast-Furnace Slag: 50 percent portland cement minimum, with fly ash or pozzolan not exceeding 25 percent.
 - e. Silica Fume: 10 percent.
 - f. Combined Fly Ash, Pozzolans, and Silica Fume: 35 percent with fly ash or pozzolans not exceeding 25 percent and silica fume not exceeding 10 percent.
 - g. Combined Fly Ash or Pozzolans, Ground Granulated Blast-Furnace Slag, and Silica Fume: 50 percent with fly ash or pozzolans not exceeding 25 percent and silica fume not exceeding 10 percent.
 3. Limit water-soluble, chloride-ion content in hardened concrete to 0.06 **OR** 0.15 **OR** 0.30 **OR** 1.00, **as directed**, percent by weight of cement.
 4. Admixtures: Use admixtures according to manufacturer's written instructions.
 - a. Use water-reducing **OR** high-range water-reducing **OR** plasticizing, **as directed**, admixture in concrete, as required, for placement and workability.
 - b. Use water-reducing and retarding admixture when required by high temperatures, low humidity, or other adverse placement conditions.

- c. Use water-reducing admixture in pumped concrete, concrete for heavy-use industrial slabs and parking structure slabs, concrete required to be watertight, and concrete with a water-cementitious materials ratio below 0.50.
 - d. Use corrosion-inhibiting admixture in concrete mixtures where indicated.
 - 5. Color Pigment: Add color pigment to concrete mixture according to manufacturer's written instructions and to result in hardened concrete color consistent with approved mockup.
- O. Concrete Mixtures For Building Elements
1. Footings: Proportion normal-weight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa), as directed, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: 0.50 OR 0.45 OR 0.40, as directed.
 - c. Slump Limit: 4 inches (100 mm) OR 5 inches (125 mm) OR 8 inches (200 mm) for concrete with verified slump of 2 to 4 inches (50 to 100 mm) before adding high-range water-reducing admixture or plasticizing admixture, as directed, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) OR 3/4-inch (19-mm), as directed, nominal maximum aggregate size.
 2. Foundation Walls: Proportion normal-weight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa), as directed, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: 0.50 OR 0.45 OR 0.40, as directed.
 - c. Slump Limit: 4 inches (100 mm) OR 5 inches (125 mm) OR 8 inches (200 mm) for concrete with verified slump of 2 to 4 inches (50 to 100 mm) before adding high-range water-reducing admixture or plasticizing admixture, as directed, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) OR 3/4-inch (19-mm), as directed, nominal maximum aggregate size.
 3. Slabs-on-Grade: Proportion normal-weight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa), as directed, at 28 days.
 - b. Minimum Cementitious Materials Content: 470 lb/cu. yd. (279 kg/cu. m) OR 520 lb/cu. yd. (309 kg/cu. m) OR 540 lb/cu. yd. (320 kg/cu. m), as directed.
 - c. Slump Limit: 4 inches (100 mm) OR 5 inches (125 mm), as directed, plus or minus 1 inch (25 mm).
 - d. Air Content
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) OR 3/4-inch (19-mm), as directed, nominal maximum aggregate size.
 - 3) Do not allow air content of troweled finished floors to exceed 3 percent.
 - e. Steel-Fiber Reinforcement: Add to concrete mixture, according to manufacturer's written instructions, at a rate of 50 lb/cu. yd. (29.7 kg/cu. m).
 - f. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) OR 1.5 lb/cu. yd. (0.90 kg/cu. m), as directed.
 4. Suspended Slabs: Proportion normal-weight concrete mixture as follows:
 - a. Minimum Compressive Strength: 5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa), as directed, at 28 days.

- b. Minimum Cementitious Materials Content: 470 lb/cu. yd. (279 kg/cu. m) OR 520 lb/cu. yd. (309 kg/cu. m) OR 540 lb/cu. yd. (320 kg/cu. m), as directed.
 - c. Slump Limit: 4 inches (100 mm) OR 5 inches (125 mm), as directed, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) OR 3/4-inch (19-mm), as directed, nominal maximum aggregate size.
 - 3) Do not allow air content of troweled finished floors to exceed 3 percent.
 - e. Steel-Fiber Reinforcement: Add to concrete mixture, according to manufacturer's written instructions, at a rate of 50 lb/cu. yd. (29.7 kg/cu. m).
 - f. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) OR 1.5 lb/cu. yd. (0.90 kg/cu. m), as directed.
5. Suspended Slabs: Proportion structural lightweight concrete mixture as follows:
- a. Minimum Compressive Strength: 5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa), as directed, at 28 days.
 - b. Calculated Equilibrium Unit Weight: 115 lb/cu. ft. (1842 kg/cu. m) OR 110 lb/cu. ft. (1762 kg/cu. m) OR 105 lb/cu. ft. (1682 kg/cu. m), as directed, plus or minus 3 lb/cu. ft. (48.1 kg/cu. m) as determined by ASTM C 567.
 - c. Slump Limit: 4 inches (100 mm) OR 5 inches (125 mm), as directed, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 6 percent, plus or minus 2 percent at point of delivery for nominal maximum aggregate size greater than 3/8 inch (10 mm).
 - 2) 7 percent, plus or minus 2 percent at point of delivery for nominal maximum aggregate size 3/8 inch (10 mm) or less.
 - 3) Do not allow air content of troweled finished floors to exceed 3 percent.
 - e. Steel-Fiber Reinforcement: Add to concrete mixture, according to manufacturer's written instructions, at a rate of 50 lb/cu. yd. (29.7 kg/cu. m).
 - f. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) OR 1.5 lb/cu. yd. (0.90 kg/cu. m), as directed.
6. Concrete Toppings: Proportion normal-weight concrete mixture as follows:
- a. Minimum Compressive Strength: 5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa), as directed, at 28 days.
 - b. Minimum Cementitious Materials Content: 470 lb/cu. yd. (279 kg/cu. m) OR 520 lb/cu. yd. (309 kg/cu. m) OR 540 lb/cu. yd. (320 kg/cu. m), as directed.
 - c. Slump Limit: 4 inches (100 mm) OR 5 inches (125 mm), as directed, plus or minus 1 inch (25 mm).
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for 1-1/2-inch (38-mm) nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for 1-inch (25-mm) OR 3/4-inch (19-mm), as directed, nominal maximum aggregate size.
 - 3) Do not allow air content of troweled finished toppings to exceed 3 percent.
 - e. Steel-Fiber Reinforcement: Add to concrete mixture, according to manufacturer's written instructions, at a rate of 50 lb/cu. yd. (29.7 kg/cu. m).
 - f. Synthetic Fiber: Uniformly disperse in concrete mixture at manufacturer's recommended rate, but not less than 1.0 lb/cu. yd. (0.60 kg/cu. m) OR 1.5 lb/cu. yd. (0.90 kg/cu. m), as directed.
7. Building Frame Members: Proportion normal-weight concrete mixture as follows:
- a. Minimum Compressive Strength: 5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa), as directed, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: 0.50 OR 0.45 OR 0.40, as directed.

- c. Slump Limit: **4 inches (100 mm) OR 5 inches (125 mm) OR 8 inches (200 mm)** for concrete with verified slump of **2 to 4 inches (50 to 100 mm)** before adding high-range water-reducing admixture or plasticizing admixture, **as directed**, plus or minus **1 inch (25 mm)**.
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for **1-1/2-inch (38-mm)** nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for **1-inch (25-mm) OR 3/4-inch (19-mm)**, **as directed**, nominal maximum aggregate size.
8. Building Walls: Proportion normal-weight concrete mixture as follows:
- a. Minimum Compressive Strength: **5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa)**, **as directed**, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: **0.50 OR 0.45 OR 0.40**, **as directed**.
 - c. Slump Limit: **4 inches (100 mm) OR 5 inches (125 mm) OR 8 inches (200 mm)** for concrete with verified slump of **2 to 4 inches (50 to 100 mm)** before adding high-range water-reducing admixture or plasticizing admixture, **as directed**, plus or minus **1 inch (25 mm)**.
 - d. Air Content:
 - 1) 5-1/2 percent, plus or minus 1.5 percent at point of delivery for **1-1/2-inch (38-mm)** nominal maximum aggregate size.
 - 2) 6 percent, plus or minus 1.5 percent at point of delivery for **1-inch (25-mm) OR 3/4-inch (19-mm)**, **as directed**, nominal maximum aggregate size.

P. Fabricating Reinforcement

- 1. Fabricate steel reinforcement according to CRSI's "Manual of Standard Practice."

Q. Concrete Mixing

- 1. Ready-Mixed Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94/C 94M and ASTM C 1116, **as directed**, and furnish batch ticket information.
 - a. When air temperature is between **85 and 90 deg F (30 and 32 deg C)**, reduce mixing and delivery time from 1-1/2 hours to 75 minutes; when air temperature is above **90 deg F (32 deg C)**, reduce mixing and delivery time to 60 minutes.
- 2. Project-Site Mixing: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M. Mix concrete materials in appropriate drum-type batch machine mixer.
 - a. For mixer capacity of **1 cu. yd. (0.76 cu. m)** or smaller, continue mixing at least 1-1/2 minutes, but not more than 5 minutes after ingredients are in mixer, before any part of batch is released.
 - b. For mixer capacity larger than **1 cu. yd. (0.76 cu. m)**, increase mixing time by 15 seconds for each additional **1 cu. yd. (0.76 cu. m)**.
 - c. Provide batch ticket for each batch discharged and used in the Work, indicating Project identification name and number, date, mixture type, mixture time, quantity, and amount of water added. Record approximate location of final deposit in structure.

1.3 EXECUTION

A. Formwork

- 1. Design, erect, shore, brace, and maintain formwork, according to ACI 301, to support vertical, lateral, static, and dynamic loads, and construction loads that might be applied, until structure can support such loads.
- 2. Construct formwork so concrete members and structures are of size, shape, alignment, elevation, and position indicated, within tolerance limits of ACI 117.
- 3. Limit concrete surface irregularities, designated by ACI 347R as abrupt or gradual, as follows:
 - a. Class A, **1/8 inch (3.2 mm)** for smooth-formed finished surfaces.

- b. Class B, **1/4 inch (6 mm)** OR Class C, **1/2 inch (13 mm)** OR Class D, **1 inch (25 mm)**, **as directed**, for rough-formed finished surfaces.
 4. Construct forms tight enough to prevent loss of concrete mortar.
 5. Fabricate forms for easy removal without hammering or prying against concrete surfaces. Provide crush or wrecking plates where stripping may damage cast concrete surfaces. Provide top forms for inclined surfaces steeper than 1.5 horizontal to 1 vertical.
 - a. Install keyways, reglets, recesses, and the like, for easy removal.
 - b. Do not use rust-stained steel form-facing material.
 6. Set edge forms, bulkheads, and intermediate screed strips for slabs to achieve required elevations and slopes in finished concrete surfaces. Provide and secure units to support screed strips; use strike-off templates or compacting-type screeds.
 7. Provide temporary openings for cleanouts and inspection ports where interior area of formwork is inaccessible. Close openings with panels tightly fitted to forms and securely braced to prevent loss of concrete mortar. Locate temporary openings in forms at inconspicuous locations.
 8. Chamfer **OR** Do not chamfer, **as directed**, exterior corners and edges of permanently exposed concrete.
 9. Form openings, chases, offsets, sinkages, keyways, reglets, blocking, screeds, and bulkheads required in the Work. Determine sizes and locations from trades providing such items.
 10. Clean forms and adjacent surfaces to receive concrete. Remove chips, wood, sawdust, dirt, and other debris just before placing concrete.
 11. Retighten forms and bracing before placing concrete, as required, to prevent mortar leaks and maintain proper alignment.
 12. Coat contact surfaces of forms with form-release agent, according to manufacturer's written instructions, before placing reinforcement.
 - B. Embedded Items
 1. Place and secure anchorage devices and other embedded items required for adjoining work that is attached to or supported by cast-in-place concrete. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.
 - a. Install anchor rods, accurately located, to elevations required and complying with tolerances in Section 7.5 of AISC's "Code of Standard Practice for Steel Buildings and Bridges."
 - b. Install reglets to receive waterproofing and to receive through-wall flashings in outer face of concrete frame at exterior walls, where flashing is shown at lintels, shelf angles, and other conditions.
 - c. Install dovetail anchor slots in concrete structures as indicated.
 - C. Removing And Reusing Forms
 1. General: Formwork for sides of beams, walls, columns, and similar parts of the Work that does not support weight of concrete may be removed after cumulatively curing at not less than **50 deg F (10 deg C)** for 24 hours after placing concrete, if concrete is hard enough to not be damaged by form-removal operations and curing and protection operations are maintained.
 - a. Leave formwork for beam soffits, joists, slabs, and other structural elements that supports weight of concrete in place until concrete has achieved at least 70 percent of, **as directed**, its 28-day design compressive strength.
 - b. Remove forms only if shores have been arranged to permit removal of forms without loosening or disturbing shores.
 2. Clean and repair surfaces of forms to be reused in the Work. Split, frayed, delaminated, or otherwise damaged form-facing material will not be acceptable for exposed surfaces. Apply new form-release agent.
 3. When forms are reused, clean surfaces, remove fins and laitance, and tighten to close joints. Align and secure joints to avoid offsets. Do not use patched forms for exposed concrete surfaces unless approved by the Owner.
 - D. Shores And Reshores

1. Comply with **ACI 318 (ACI 318M)** and ACI 301 for design, installation, and removal of shoring and reshoring.
 - a. Do not remove shoring or reshoring until measurement of slab tolerances is complete.
 2. In multistory construction, extend shoring or reshoring over a sufficient number of stories to distribute loads in such a manner that no floor or member will be excessively loaded or will induce tensile stress in concrete members without sufficient steel reinforcement.
 3. Plan sequence of removal of shores and reshore to avoid damage to concrete. Locate and provide adequate reshoring to support construction without excessive stress or deflection.
- E. Vapor Retarders
1. Plastic Vapor Retarders: Place, protect, and repair vapor retarders according to ASTM E 1643 and manufacturer's written instructions.
 - a. Lap joints **6 inches (150 mm)** and seal with manufacturer's recommended tape.
 2. Bituminous Vapor Retarders: Place, protect, and repair vapor retarders according to manufacturer's written instructions.
 3. Granular Course: Cover vapor retarder with granular fill **OR** fine-graded granular material, **as directed**, moisten, and compact with mechanical equipment to elevation tolerances of plus **0 inch (0 mm)** or minus **3/4 inch (19 mm)**.
 - a. Place and compact a **1/2-inch- (13-mm-)** thick layer of fine-graded granular material over granular fill.
- F. Steel Reinforcement
1. General: Comply with CRSI's "Manual of Standard Practice" for placing reinforcement.
 - a. Do not cut or puncture vapor retarder. Repair damage and reseal vapor retarder before placing concrete.
 2. Clean reinforcement of loose rust and mill scale, earth, ice, and other foreign materials that would reduce bond to concrete.
 3. Accurately position, support, and secure reinforcement against displacement. Locate and support reinforcement with bar supports to maintain minimum concrete cover. Do not tack weld crossing reinforcing bars.
 - a. Weld reinforcing bars according to AWS D1.4, where indicated.
 4. Set wire ties with ends directed into concrete, not toward exposed concrete surfaces.
 5. Install welded wire reinforcement in longest practicable lengths on bar supports spaced to minimize sagging. Lap edges and ends of adjoining sheets at least one mesh spacing. Offset laps of adjoining sheet widths to prevent continuous laps in either direction. Lace overlaps with wire.
 6. Epoxy-Coated Reinforcement: Repair cut and damaged epoxy coatings with epoxy repair coating according to ASTM D 3963/D 3963M. Use epoxy-coated steel wire ties to fasten epoxy-coated steel reinforcement.
 7. Zinc-Coated Reinforcement: Repair cut and damaged zinc coatings with zinc repair material according to ASTM A 780. Use galvanized steel wire ties to fasten zinc-coated steel reinforcement.
- G. Joints
1. General: Construct joints true to line with faces perpendicular to surface plane of concrete.
 2. Construction Joints: Install so strength and appearance of concrete are not impaired, at locations indicated or as approved by the Owner.
 - a. Place joints perpendicular to main reinforcement. Continue reinforcement across construction joints, unless otherwise indicated. Do not continue reinforcement through sides of strip placements of floors and slabs.
 - b. Form keyed joints as indicated. Embed keys at least **1-1/2 inches (38 mm)** into concrete.
 - c. Locate joints for beams, slabs, joists, and girders in the middle third of spans. Offset joints in girders a minimum distance of twice the beam width from a beam-girder intersection.
 - d. Locate horizontal joints in walls and columns at underside of floors, slabs, beams, and girders and at the top of footings or floor slabs.

- e. Space vertical joints in walls, **as directed**. Locate joints beside piers integral with walls, near corners, and in concealed locations where possible.
 - f. Use a bonding agent at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
 - g. Use epoxy-bonding adhesive at locations where fresh concrete is placed against hardened or partially hardened concrete surfaces.
 3. Contraction Joints in Slabs-on-Grade: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of concrete thickness as follows:
 - a. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint to a radius of **1/8 inch (3.2 mm)**. Repeat grooving of contraction joints after applying surface finishes. Eliminate groover tool marks on concrete surfaces.
 - b. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut **1/8-inch- (3.2-mm-)** wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before concrete develops random contraction cracks.
 4. Isolation Joints in Slabs-on-Grade: After removing formwork, install joint-filler strips at slab junctions with vertical surfaces, such as column pedestals, foundation walls, grade beams, and other locations, as indicated.
 - a. Extend joint-filler strips full width and depth of joint, terminating flush with finished concrete surface, unless otherwise indicated.
 - b. Terminate full-width joint-filler strips not less than **1/2 inch (13 mm)** or more than **1 inch (25 mm)** below finished concrete surface where joint sealants, specified in Division 07 Section "Joint Sealants", are indicated.
 - c. Install joint-filler strips in lengths as long as practicable. Where more than one length is required, lace or clip sections together.
 5. Doweled Joints: Install dowel bars and support assemblies at joints where indicated. Lubricate or asphalt coat one-half of dowel length to prevent concrete bonding to one side of joint.
- H. Waterstops
1. Flexible Waterstops: Install in construction joints and at other joints indicated to form a continuous diaphragm. Install in longest lengths practicable. Support and protect exposed waterstops during progress of the Work. Field fabricate joints in waterstops according to manufacturer's written instructions.
 2. Self-Expanding Strip Waterstops: Install in construction joints and at other locations indicated, according to manufacturer's written instructions, adhesive bonding, mechanically fastening, and firmly pressing into place. Install in longest lengths practicable.
- I. Concrete Placement
1. Before placing concrete, verify that installation of formwork, reinforcement, and embedded items is complete and that required inspections have been performed.
 2. Do not add water to concrete during delivery, at Project site, or during placement unless approved by the Owner.
 3. Before test sampling and placing concrete, water may be added at Project site, subject to limitations of ACI 301.
 - a. Do not add water to concrete after adding high-range water-reducing admixtures to mixture.
 4. Deposit concrete continuously in one layer or in horizontal layers of such thickness that no new concrete will be placed on concrete that has hardened enough to cause seams or planes of weakness. If a section cannot be placed continuously, provide construction joints as indicated. Deposit concrete to avoid segregation.
 - a. Deposit concrete in horizontal layers of depth to not exceed formwork design pressures and in a manner to avoid inclined construction joints.
 - b. Consolidate placed concrete with mechanical vibrating equipment according to ACI 301.
 - c. Do not use vibrators to transport concrete inside forms. Insert and withdraw vibrators vertically at uniformly spaced locations to rapidly penetrate placed layer and at least **6**

- inches (150 mm) into preceding layer. Do not insert vibrators into lower layers of concrete that have begun to lose plasticity. At each insertion, limit duration of vibration to time necessary to consolidate concrete and complete embedment of reinforcement and other embedded items without causing mixture constituents to segregate.
5. Deposit and consolidate concrete for floors and slabs in a continuous operation, within limits of construction joints, until placement of a panel or section is complete.
 - a. Consolidate concrete during placement operations so concrete is thoroughly worked around reinforcement and other embedded items and into corners.
 - b. Maintain reinforcement in position on chairs during concrete placement.
 - c. Screed slab surfaces with a straightedge and strike off to correct elevations.
 - d. Slope surfaces uniformly to drains where required.
 - e. Begin initial floating using bull floats or darbies to form a uniform and open-textured surface plane, before excess bleedwater appears on the surface. Do not further disturb slab surfaces before starting finishing operations.
 6. Cold-Weather Placement: Comply with ACI 306.1 and as follows. Protect concrete work from physical damage or reduced strength that could be caused by frost, freezing actions, or low temperatures.
 - a. When average high and low temperature is expected to fall below 40 deg F (4.4 deg C) for three successive days, maintain delivered concrete mixture temperature within the temperature range required by ACI 301.
 - b. Do not use frozen materials or materials containing ice or snow. Do not place concrete on frozen subgrade or on subgrade containing frozen materials.
 - c. Do not use calcium chloride, salt, or other materials containing antifreeze agents or chemical accelerators unless otherwise specified and approved in mixture designs.
 7. Hot-Weather Placement: Comply with ACI 301 and as follows:
 - a. Maintain concrete temperature below 90 deg F (32 deg C) at time of placement. Chilled mixing water or chopped ice may be used to control temperature, provided water equivalent of ice is calculated to total amount of mixing water. Using liquid nitrogen to cool concrete is Contractor's option.
 - b. Fog-spray forms, steel reinforcement, and subgrade just before placing concrete. Keep subgrade uniformly moist without standing water, soft spots, or dry areas.
- J. Finishing Formed Surfaces
1. Rough-Formed Finish: As-cast concrete texture imparted by form-facing material with tie holes and defects repaired and patched. Remove fins and other projections that exceed specified limits on formed-surface irregularities.
 - a. Apply to concrete surfaces not exposed to public view.
 2. Smooth-Formed Finish: As-cast concrete texture imparted by form-facing material, arranged in an orderly and symmetrical manner with a minimum of seams. Repair and patch tie holes and defects. Remove fins and other projections that exceed specified limits on formed-surface irregularities.
 - a. Apply to concrete surfaces exposed to public view, **OR** to receive a rubbed finish, **OR** to be covered with a coating or covering material applied directly to concrete, **as directed**.
 3. Rubbed Finish: Apply the following to smooth-formed finished as-cast concrete where indicated:
 - a. Smooth-Rubbed Finish: Not later than one day after form removal, moisten concrete surfaces and rub with carborundum brick or another abrasive until producing a uniform color and texture. Do not apply cement grout other than that created by the rubbing process.
 - b. Grout-Cleaned Finish: Wet concrete surfaces and apply grout of a consistency of thick paint to coat surfaces and fill small holes. Mix one part portland cement to one and one-half parts fine sand with a 1:1 mixture of bonding admixture and water. Add white portland cement in amounts determined by trial patches so color of dry grout will match adjacent surfaces. Scrub grout into voids and remove excess grout. When grout whitens, rub surface with clean burlap and keep surface damp by fog spray for at least 36 hours.

- c. Cork-Floated Finish: Wet concrete surfaces and apply a stiff grout. Mix one part portland cement and one part fine sand with a 1:1 mixture of bonding agent and water. Add white portland cement in amounts determined by trial patches so color of dry grout will match adjacent surfaces. Compress grout into voids by grinding surface. In a swirling motion, finish surface with a cork float.
 4. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces, unless otherwise indicated.
- K. Finishing Floors And Slabs
 1. General: Comply with ACI 302.1R recommendations for screeding, restraightening, and finishing operations for concrete surfaces. Do not wet concrete surfaces.
 2. Scratch Finish: While still plastic, texture concrete surface that has been screeded and bull-floated or darbled. Use stiff brushes, brooms, or rakes to produce a profile amplitude of **1/4 inch (6 mm)** in 1 direction.
 - a. Apply scratch finish to surfaces indicated and to receive concrete floor toppings **OR** to receive mortar setting beds for bonded cementitious floor finishes, **as directed**.
 3. Float Finish: Consolidate surface with power-driven floats or by hand floating if area is small or inaccessible to power driven floats. Restraighten, cut down high spots, and fill low spots. Repeat float passes and restraightening until surface is left with a uniform, smooth, granular texture.
 - a. Apply float finish to surfaces indicated **OR** to receive trowel finish **OR** to be covered with fluid-applied or sheet waterproofing, built-up or membrane roofing, or sand-bed terrazzo, **as directed**.
 4. Trowel Finish: After applying float finish, apply first troweling and consolidate concrete by hand or power-driven trowel. Continue troweling passes and restraighten until surface is free of trowel marks and uniform in texture and appearance. Grind smooth any surface defects that would telegraph through applied coatings or floor coverings.
 - a. Apply a trowel finish to surfaces indicated **OR** exposed to view **OR** to be covered with resilient flooring, carpet, ceramic or quarry tile set over a cleavage membrane, paint, or another thin-film-finish coating system, **as directed**.
 - b. Finish surfaces to the following tolerances, according to **ASTM E 1155 (ASTM E 1155M)**, for a randomly trafficked floor surface:
 - 1) Specified overall values of flatness, F(F) 25; and of levelness, F(L) 20; with minimum local values of flatness, F(F) 17; and of levelness, F(L) 15.
 - 2) Specified overall values of flatness, F(F) 35; and of levelness, F(L) 25; with minimum local values of flatness, F(F) 24; and of levelness, F(L) 17; for slabs-on-grade.
 - 3) Specified overall values of flatness, F(F) 30; and of levelness, F(L) 20; with minimum local values of flatness, F(F) 24; and of levelness, F(L) 15; for suspended slabs.
 - 4) Specified overall values of flatness, F(F) 45; and of levelness, F(L) 35; with minimum local values of flatness, F(F) 30; and of levelness, F(L) 24.
 - c. Finish and measure surface so gap at any point between concrete surface and an unlevelled, freestanding, **10-foot- (3.05-m-)** long straightedge resting on 2 high spots and placed anywhere on the surface does not exceed **1/4 inch (6 mm) OR 3/16 inch (4.8 mm) OR 1/8 inch (3.2 mm), as directed**.
 5. Trowel and Fine-Broom Finish: Apply a first trowel finish to surfaces indicated **OR** where ceramic or quarry tile is to be installed by either thickset or thin-set method, **as directed**. While concrete is still plastic, slightly scarify surface with a fine broom.
 - a. Comply with flatness and levelness tolerances for trowel finished floor surfaces.
 6. Broom Finish: Apply a broom finish to exterior concrete platforms, steps, and ramps, and elsewhere as indicated.
 - a. Immediately after float finishing, slightly roughen trafficked surface by brooming with fiber-bristle broom perpendicular to main traffic route. Coordinate required final finish with the Owner before application.

7. Slip-Resistive Finish: Before final floating, apply slip-resistive aggregate **OR** aluminum granule, **as directed**, finish where indicated and to concrete stair treads, platforms, and ramps. Apply according to manufacturer's written instructions and as follows:
 - a. Uniformly spread **25 lb/100 sq. ft. (12 kg/10 sq. m)** of dampened slip-resistive aggregate **OR** aluminum granules, **as directed**, over surface in 1 or 2 applications. Tamp aggregate flush with surface, but do not force below surface.
 - b. After broadcasting and tamping, apply float finish.
 - c. After curing, lightly work surface with a steel wire brush or an abrasive stone and water to expose slip-resistive aggregate **OR** aluminum granules, **as directed**.
 8. Dry-Shake Floor Hardener Finish: After initial floating, apply dry-shake floor hardener to surfaces according to manufacturer's written instructions and as follows:
 - a. Uniformly apply dry-shake floor hardener at a rate of **100 lb/100 sq. ft. (49 kg/10 sq. m)**, **as directed**, unless greater amount is recommended by manufacturer.
 - b. Uniformly distribute approximately two-thirds of dry-shake floor hardener over surface by hand or with mechanical spreader, and embed by power floating. Follow power floating with a second dry-shake floor hardener application, uniformly distributing remainder of material, and embed by power floating.
 - c. After final floating, apply a trowel finish. Cure concrete with curing compound recommended by dry-shake floor hardener manufacturer and apply immediately after final finishing.
- L. Miscellaneous Concrete Items
1. Filling In: Fill in holes and openings left in concrete structures, unless otherwise indicated, after work of other trades is in place. Mix, place, and cure concrete, as specified, to blend with in-place construction. Provide other miscellaneous concrete filling indicated or required to complete the Work.
 2. Curbs: Provide monolithic finish to interior curbs by stripping forms while concrete is still green and by steel-troweling surfaces to a hard, dense finish with corners, intersections, and terminations slightly rounded.
 3. Equipment Bases and Foundations: Provide machine and equipment bases and foundations as shown on Drawings. Set anchor bolts for machines and equipment at correct elevations, complying with diagrams or templates from manufacturer furnishing machines and equipment.
 4. Steel Pan Stairs: Provide concrete fill for steel pan stair treads, landings, and associated items. Cast-in inserts and accessories as shown on Drawings. Screed, tamp, and trowel-finish concrete surfaces.
- M. Concrete Protecting And Curing
1. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and ACI 301 for hot-weather protection during curing.
 2. Evaporation Retarder: Apply evaporation retarder to unformed concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching **0.2 lb/sq. ft. x h (1 kg/sq. m x h)** before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete, but before float finishing.
 3. Formed Surfaces: Cure formed concrete surfaces, including underside of beams, supported slabs, and other similar surfaces. If forms remain during curing period, moist cure after loosening forms. If removing forms before end of curing period, continue curing for the remainder of the curing period.
 4. Unformed Surfaces: Begin curing immediately after finishing concrete. Cure unformed surfaces, including floors and slabs, concrete floor toppings, and other surfaces.
 5. Cure concrete according to ACI 308.1, by one or a combination of the following methods:
 - a. Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:
 - 1) Water.
 - 2) Continuous water-fog spray.

- 3) Absorptive cover, water saturated, and kept continuously wet. Cover concrete surfaces and edges with **12-inch (300-mm)** lap over adjacent absorptive covers.
 - b. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least **12 inches (300 mm)**, and sealed by waterproof tape or adhesive. Cure for not less than seven days. Immediately repair any holes or tears during curing period using cover material and waterproof tape.
 - 1) Moisture cure or use moisture-retaining covers to cure concrete surfaces to receive floor coverings.
 - 2) Moisture cure or use moisture-retaining covers to cure concrete surfaces to receive penetrating liquid floor treatments.
 - 3) Cure concrete surfaces to receive floor coverings with either a moisture-retaining cover or a curing compound that the manufacturer certifies will not interfere with bonding of floor covering used on Project.
 - c. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.
 - 1) After curing period has elapsed, remove curing compound without damaging concrete surfaces by method recommended by curing compound manufacturer unless manufacturer certifies curing compound will not interfere with bonding of floor covering used on Project.
 - d. Curing and Sealing Compound: Apply uniformly to floors and slabs indicated in a continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Repeat process 24 hours later and apply a second coat. Maintain continuity of coating and repair damage during curing period.
- N. Liquid Floor Treatments
 1. Penetrating Liquid Floor Treatment: Prepare, apply, and finish penetrating liquid floor treatment according to manufacturer's written instructions.
 - a. Remove curing compounds, sealers, oil, dirt, laitance, and other contaminants and complete surface repairs.
 - b. Do not apply to concrete that is less than three **OR** seven **OR** 14 **OR** 28, **as directed**, days' old.
 - c. Apply liquid until surface is saturated, scrubbing into surface until a gel forms; rewet; and repeat brooming or scrubbing. Rinse with water; remove excess material until surface is dry. Apply a second coat in a similar manner if surface is rough or porous.
 2. Polished Concrete Floor Treatment: Apply polished concrete finish system to cured and prepared slabs to match.
 - a. Machine grind floor surfaces to receive polished finishes level and smooth and to depth required to reveal aggregate to match.
 - b. Apply penetrating liquid floor treatment for polished concrete in polishing sequence and according to manufacturer's written instructions, allowing recommended drying time between successive coats.
 - c. Continue polishing with progressively finer grit diamond polishing pads to gloss level to match approved mockup.
 - d. Control and dispose of waste products produced by grinding and polishing operations.
 - e. Neutralize and clean polished floor surfaces.
 3. Sealing Coat: Uniformly apply a continuous sealing coat of curing and sealing compound to hardened concrete by power spray or roller according to manufacturer's written instructions.
- O. Joint Filling
 1. Prepare, clean, and install joint filler according to manufacturer's written instructions.
 - a. Defer joint filling until concrete has aged at least one **OR** six, **as directed**, month(s). Do not fill joints until construction traffic has permanently ceased.

2. Remove dirt, debris, saw cuttings, curing compounds, and sealers from joints; leave contact faces of joint clean and dry.
3. Install semirigid joint filler full depth in saw-cut joints and at least **2 inches (50 mm)** deep in formed joints. Overfill joint and trim joint filler flush with top of joint after hardening.

P. Concrete Surface Repairs

1. Defective Concrete: Repair and patch defective areas when approved by the Owner. Remove and replace concrete that cannot be repaired and patched to the Owner's approval.
2. Patching Mortar: Mix dry-pack patching mortar, consisting of one part portland cement to two and one-half parts fine aggregate passing a **No. 16 (1.18-mm)** sieve, using only enough water for handling and placing.
3. Repairing Formed Surfaces: Surface defects include color and texture irregularities, cracks, spalls, air bubbles, honeycombs, rock pockets, fins and other projections on the surface, and stains and other discolorations that cannot be removed by cleaning.
 - a. Immediately after form removal, cut out honeycombs, rock pockets, and voids more than **1/2 inch (13 mm)** in any dimension in solid concrete, but not less than **1 inch (25 mm)** in depth. Make edges of cuts perpendicular to concrete surface. Clean, dampen with water, and brush-coat holes and voids with bonding agent. Fill and compact with patching mortar before bonding agent has dried. Fill form-tie voids with patching mortar or cone plugs secured in place with bonding agent.
 - b. Repair defects on surfaces exposed to view by blending white portland cement and standard portland cement so that, when dry, patching mortar will match surrounding color. Patch a test area at inconspicuous locations to verify mixture and color match before proceeding with patching. Compact mortar in place and strike off slightly higher than surrounding surface.
 - c. Repair defects on concealed formed surfaces that affect concrete's durability and structural performance as determined by the Owner.
4. Repairing Unformed Surfaces: Test unformed surfaces, such as floors and slabs, for finish and verify surface tolerances specified for each surface. Correct low and high areas. Test surfaces sloped to drain for trueness of slope and smoothness; use a sloped template.
 - a. Repair finished surfaces containing defects. Surface defects include spalls, popouts, honeycombs, rock pockets, crazing and cracks in excess of **0.01 inch (0.25 mm)** wide or that penetrate to reinforcement or completely through unreinforced sections regardless of width, and other objectionable conditions.
 - b. After concrete has cured at least 14 days, correct high areas by grinding.
 - c. Correct localized low areas during or immediately after completing surface finishing operations by cutting out low areas and replacing with patching mortar. Finish repaired areas to blend into adjacent concrete.
 - d. Correct other low areas scheduled to receive floor coverings with a repair underlayment. Prepare, mix, and apply repair underlayment and primer according to manufacturer's written instructions to produce a smooth, uniform, plane, and level surface. Feather edges to match adjacent floor elevations.
 - e. Correct other low areas scheduled to remain exposed with a repair topping. Cut out low areas to ensure a minimum repair topping depth of **1/4 inch (6 mm)** to match adjacent floor elevations. Prepare, mix, and apply repair topping and primer according to manufacturer's written instructions to produce a smooth, uniform, plane, and level surface.
 - f. Repair defective areas, except random cracks and single holes **1 inch (25 mm)** or less in diameter, by cutting out and replacing with fresh concrete. Remove defective areas with clean, square cuts and expose steel reinforcement with at least a **3/4-inch (19-mm)** clearance all around. Dampen concrete surfaces in contact with patching concrete and apply bonding agent. Mix patching concrete of same materials and mixture as original concrete except without coarse aggregate. Place, compact, and finish to blend with adjacent finished concrete. Cure in same manner as adjacent concrete.
 - g. Repair random cracks and single holes **1 inch (25 mm)** or less in diameter with patching mortar. Groove top of cracks and cut out holes to sound concrete and clean off dust, dirt,

- and loose particles. Dampen cleaned concrete surfaces and apply bonding agent. Place patching mortar before bonding agent has dried. Compact patching mortar and finish to match adjacent concrete. Keep patched area continuously moist for at least 72 hours.
5. Perform structural repairs of concrete, subject to the Owner's approval, using epoxy adhesive and patching mortar.
 6. Repair materials and installation not specified above may be used, subject to the Owner's approval.
- Q. Field Quality Control
1. Testing and Inspecting: Engage a qualified testing and inspecting agency to perform tests and inspections and to submit reports.
 2. Inspections:
 - a. Steel reinforcement placement.
 - b. Steel reinforcement welding.
 - c. Headed bolts and studs.
 - d. Verification of use of required design mixture.
 - e. Concrete placement, including conveying and depositing.
 - f. Curing procedures and maintenance of curing temperature.
 - g. Verification of concrete strength before removal of shores and forms from beams and slabs.
 3. Concrete Tests: Testing of composite samples of fresh concrete obtained according to ASTM C 172 shall be performed according to the following requirements:
 - a. Testing Frequency: Obtain at least one composite sample for each 100 cu. yd. (76 cu. m) or fraction thereof of each concrete mixture placed each day.
 - 1) When frequency of testing will provide fewer than five compressive-strength tests for each concrete mixture, testing shall be conducted from at least five randomly selected batches or from each batch if fewer than five are used.
 - b. Slump: ASTM C 143/C 143M; one test at point of placement for each composite sample, but not less than one test for each day's pour of each concrete mixture. Perform additional tests when concrete consistency appears to change.
 - c. Air Content: ASTM C 231, pressure method, for normal-weight concrete; ASTM C 173/C 173M, volumetric method, for structural lightweight concrete, **as directed**; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
 - d. Concrete Temperature: ASTM C 1064/C 1064M; one test hourly when air temperature is 40 deg F (4.4 deg C) and below and when 80 deg F (27 deg C) and above, and one test for each composite sample.
 - e. Unit Weight: ASTM C 567, fresh unit weight of structural lightweight concrete; one test for each composite sample, but not less than one test for each day's pour of each concrete mixture.
 - f. Compression Test Specimens: ASTM C 31/C 31M.
 - 1) Cast and laboratory cure two sets of two standard cylinder specimens for each composite sample.
 - 2) Cast and field cure two sets of two standard cylinder specimens for each composite sample.
 - g. Compressive-Strength Tests: ASTM C 39/C 39M; test one set of two laboratory-cured specimens at 7 days and one set of two specimens at 28 days.
 - 1) Test one set of two field-cured specimens at 7 days and one set of two specimens at 28 days.
 - 2) A compressive-strength test shall be the average compressive strength from a set of two specimens obtained from same composite sample and tested at age indicated.
 - h. When strength of field-cured cylinders is less than 85 percent of companion laboratory-cured cylinders, Contractor shall evaluate operations and provide corrective procedures for protecting and curing in-place concrete.
 - i. Strength of each concrete mixture will be satisfactory if every average of any three consecutive compressive-strength tests equals or exceeds specified compressive strength

and no compressive-strength test value falls below specified compressive strength by more than **500 psi (3.4 MPa)**.

- j. Test results shall be reported in writing to the Owner, concrete manufacturer, and Contractor within 48 hours of testing. Reports of compressive-strength tests shall contain Project identification name and number, date of concrete placement, name of concrete testing and inspecting agency, location of concrete batch in Work, design compressive strength at 28 days, concrete mixture proportions and materials, compressive breaking strength, and type of break for both 7- and 28-day tests.
 - k. Nondestructive Testing: Impact hammer, sonoscope, or other nondestructive device may be permitted by the Owner but will not be used as sole basis for approval or rejection of concrete.
 - l. Additional Tests: Testing and inspecting agency shall make additional tests of concrete when test results indicate that slump, air entrainment, compressive strengths, or other requirements have not been met, as directed by the Owner. Testing and inspecting agency may conduct tests to determine adequacy of concrete by cored cylinders complying with ASTM C 42/C 42M or by other methods as directed by the Owner.
 - m. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
 - n. Correct deficiencies in the Work that test reports and inspections indicate do not comply with the Contract Documents.
4. Measure floor and slab flatness and levelness according to **ASTM E 1155 (ASTM E 1155M)** within 24 **OR** 48, **as directed**, hours of finishing.
- R. Protection Of Liquid Floor Treatments
- 1. Protect liquid floor treatment from damage and wear during the remainder of construction period. Use protective methods and materials, including temporary covering, recommended in writing by liquid floor treatments installer.

END OF SECTION 03 30 00 00

SECTION 03 30 53 00 - MISCELLANEOUS CAST-IN-PLACE CONCRETE

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for miscellaneous cast-in-place concrete. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section includes cast-in-place concrete, including reinforcement, concrete materials, mixture design, placement procedures, and finishes.

C. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittal:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content. Include statement indicating costs for each product having recycled content.
 - b. Design Mixtures for Credit ID 1.1: For each concrete mixture containing fly ash as a replacement for portland cement or other portland cement replacements. For each design mixture submitted, include an equivalent concrete mixture that does not contain portland cement replacements, to determine amount of portland cement replaced.
3. Other Action Submittal:
 - a. Design Mixtures: For each concrete mixture.

D. Quality Assurance

1. Ready-Mix-Concrete Manufacturer Qualifications: A firm experienced in manufacturing ready-mixed concrete products and that complies with ASTM C 94/C 94M requirements for production facilities and equipment.
2. Comply with the following sections of **ACI 301 (ACI 301M)**, unless modified by requirements in the Contract Documents:
 - a. "General Requirements."
 - b. "Formwork and Formwork Accessories."
 - c. "Reinforcement and Reinforcement Supports."
 - d. "Concrete Mixtures."
 - e. "Handling, Placing, and Constructing."
 - f. "Lightweight Concrete."
3. Comply with ACI 117, "Specifications for Tolerances for Concrete Construction and Materials."

1.2 PRODUCTS

A. Formwork

1. Furnish formwork and formwork accessories according to **ACI 301 (ACI 301M)**.

B. Steel Reinforcement

1. Recycled Content: Provide steel reinforcement with an average recycled content of steel products so that postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 percent.
2. Reinforcing Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420)**, deformed.
3. Plain-Steel Wire: ASTM A 82/A 82M, as drawn.

03 - Concrete

4. Plain-Steel Welded Wire Reinforcement: ASTM A 185/A 185M, fabricated from as-drawn steel wire into flat sheets.
5. Deformed-Steel Welded Wire Reinforcement: ASTM A 497/A 497M, flat sheet.

C. Concrete Materials

1. Cementitious Material: Use the following cementitious materials, of the same type, brand, and source throughout Project:
 - a. Portland Cement: ASTM C 150, Type I **OR** Type II **OR** Type I/II **OR** Type III **OR** Type V, **as directed**. Supplement with the following, **as directed**:
 - 1) Fly Ash: ASTM C 618, Class C or F.
 - 2) Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
 - b. Blended Hydraulic Cement: ASTM C 595, Type IS, portland blast-furnace slag **OR** Type IP, portland-pozzolan **OR** Type I (PM), pozzolan-modified portland **OR** Type I (SM), slag-modified Portland, **as directed**, cement.
2. Normal-Weight Aggregate: ASTM C 33, graded, **1-1/2-inch (38-mm)** nominal maximum aggregate size.
3. Lightweight Aggregate: ASTM C 330, **1-inch (25-mm)** nominal maximum aggregate size.
4. Water: ASTM C 94/C 94M.
5. Synthetic Fiber: Monofilament or fibrillated polypropylene fibers engineered and designed for use in concrete, complying with ASTM C 1116/C 1116M, Type III, **1/2 to 1-1/2 inches (13 to 38 mm)** long.

D. Admixtures

1. Air-Entraining Admixture: ASTM C 260.
2. Chemical Admixtures: Provide admixtures certified by manufacturer to be compatible with other admixtures and that will not contribute water-soluble chloride ions exceeding those permitted in hardened concrete. Do not use calcium chloride or admixtures containing calcium chloride.
 - a. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 - b. Retarding Admixture: ASTM C 494/C 494M, Type B.
 - c. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 - d. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
 - e. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
 - f. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M, Type II.

E. Related Materials

1. Vapor Retarder: Plastic sheet, ASTM E 1745, Class A or B.
OR
Vapor Retarder: Polyethylene sheet, ASTM D 4397, not less than **10 mils (0.25 mm)** thick; or plastic sheet, ASTM E 1745, Class C.
2. Joint-Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber, or ASTM D 1752, cork or self-expanding cork.

F. Curing Materials

1. Evaporation Retarder: Waterborne, monomolecular film forming; manufactured for application to fresh concrete.
2. Absorptive Cover: AASHTO M 182, Class 3, burlap cloth or cotton mats.
3. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
4. Water: Potable.
5. Clear, Waterborne, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B.
6. Clear, Waterborne **OR** Solvent-Borne, **as directed**, Membrane-Forming Curing and Sealing Compound: ASTM C 1315, Type 1, Class A.

G. Concrete Mixtures

1. Comply with **ACI 301 (ACI 301M)** requirements for concrete mixtures.

2. Normal-Weight Concrete: Prepare design mixes, proportioned according to **ACI 301 (ACI 301M)**, as follows:
 - a. Minimum Compressive Strength: **4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa) OR 3000 psi (20.7 MPa)**, as directed, at 28 days.
 - b. Maximum Water-Cementitious Materials Ratio: **0.50 OR 0.45**, as directed.
 - c. Cementitious Materials: Use fly ash, pozzolan, ground granulated blast-furnace slag, and silica fume as needed to reduce the total amount of portland cement, which would otherwise be used, by not less than 40 percent.
 - d. Slump Limit: **4 inches (100 mm) OR 5 inches (125 mm) OR 8 inches (200 mm)** for concrete with verified slump of **2 to 4 inches (50 to 100 mm)** before adding high-range water-reducing admixture or plasticizing admixture, as directed, plus or minus **1 inch (25 mm)**.
 - e. Air Content: Maintain within range permitted by **ACI 301 (ACI 301M)**. Do not allow air content of trowel-finished floor slabs to exceed 3 percent.
3. Structural Lightweight Concrete Mix: ASTM C 330, proportioned to produce concrete with a minimum compressive strength of **3000 psi (20.7 MPa)** at 28 days and a calculated equilibrium unit weight of **110 lb/cu. ft. (1762 kg/cu. m)** plus or minus **3 lb/cu. ft. (48.1 kg/cu. m)**, as determined by ASTM C 567. Concrete slump at point of placement shall be the minimum necessary for efficient mixing, placing, and finishing.
 - a. Limit slump to **5 inches (125 mm)** for troweled slabs and **4 inches (100 mm)** for other slabs.
4. Synthetic Fiber: Uniformly disperse in concrete mix at manufacturer's recommended rate but not less than a rate of **1.0 lb/cu. yd. (0.60 kg/cu. m) OR 1.5 lb/cu. yd. (0.90 kg/cu. m)**, as directed.

H. Concrete Mixing

1. Ready-Mixed Concrete: Measure, batch, mix, and deliver concrete according to ASTM C 94/C 94M and ASTM C 1116/C 1116, as directed, and furnish batch ticket information.
 - a. When air temperature is above **90 deg F (32 deg C)**, reduce mixing and delivery time to 60 minutes.
2. Project-Site Mixing: Measure, batch, and mix concrete materials and concrete according to ASTM C 94/C 94M. Mix concrete materials in appropriate drum-type batch machine mixer.
 - a. For mixer capacity of **1 cu. yd. (0.76 cu. m)** or smaller, continue mixing at least 1-1/2 minutes, but not more than 5 minutes after ingredients are in mixer, before any part of batch is released.
 - b. For mixer capacity larger than **1 cu. yd. (0.76 cu. m)**, increase mixing time by 15 seconds for each additional **1 cu. yd. (0.76 cu. m)**.
 - c. Provide batch ticket for each batch discharged and used in the Work, indicating Project identification name and number, date, mix type, mix time, quantity, and amount of water added. Record approximate location of final deposit in structure.

1.3 EXECUTION

A. Formwork

1. Design, construct, erect, brace, and maintain formwork according to **ACI 301 (ACI 301M)**.

B. Embedded Items

1. Place and secure anchorage devices and other embedded items required for adjoining work attached to or supported by cast-in-place concrete. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

C. Vapor Retarders

1. Install, protect, and repair vapor retarders according to ASTM E 1643; place sheets in position with longest dimension parallel with direction of pour.
 - a. Lap joints **6 inches (150 mm)** and seal with manufacturer's recommended adhesive or joint tape.

03 - Concrete

- D. Steel Reinforcement
1. Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
 - a. Do not cut or puncture vapor retarder. Repair damage and reseal vapor retarder before placing concrete.
- E. Joints
1. General: Construct joints true to line with faces perpendicular to surface plane of concrete.
 2. Construction Joints: Locate and install so strength and appearance of concrete are not impaired, at locations indicated or as approved by the Owner.
 3. Contraction Joints in Slabs-on-Grade: Form weakened-plane contraction joints, sectioning concrete into areas as indicated. Construct contraction joints for a depth equal to at least one-fourth of concrete thickness, as follows:
 - a. Grooved Joints: Form contraction joints after initial floating by grooving and finishing each edge of joint with groover tool to a radius of **1/8 inch (3.2 mm)**. Repeat grooving of contraction joints after applying surface finishes. Eliminate groover marks on concrete surfaces.
 - b. Sawed Joints: Form contraction joints with power saws equipped with shatterproof abrasive or diamond-rimmed blades. Cut **1/8-inch- (3.2-mm-)** wide joints into concrete when cutting action will not tear, abrade, or otherwise damage surface and before concrete develops random contraction cracks.
 4. Isolation Joints: Install joint-filler strips at junctions with slabs-on-grade and vertical surfaces, such as column pedestals, foundation walls, grade beams, and other locations, as indicated.
 - a. Extend joint fillers full width and depth of joint, terminating flush with finished concrete surface, unless otherwise indicated.
- F. Concrete Placement
1. Comply with **ACI 301 (ACI 301M)** for placing concrete.
 2. Before test sampling and placing concrete, water may be added at Project site, subject to limitations of **ACI 301 (ACI 301M)**.
OR
Do not add water to concrete during delivery, at Project site, or during placement.
 3. Consolidate concrete with mechanical vibrating equipment.
- G. Finishing Formed Surfaces
1. Rough-Formed Finish: As-cast concrete texture imparted by form-facing material with tie holes and defective areas repaired and patched. Remove fins and other projections exceeding **1/2 inch (13 mm)**.
 - a. Apply to concrete surfaces not exposed to public view, **as directed**.
 2. Smooth-Formed Finish: As-cast concrete texture imparted by form-facing material, arranged in an orderly and symmetrical manner with a minimum of seams. Repair and patch tie holes and defective areas. Remove fins and other projections exceeding **1/8 inch (3 mm)**.
 - a. Apply to concrete surfaces exposed to public view, **OR** to receive a rubbed finish, **OR** to be covered with a coating or covering material applied directly to concrete, **as directed**.
 3. Rubbed Finish: Apply the following rubbed finish, defined in **ACI 301 (ACI 301M)**, to smooth-formed finished as-cast concrete where indicated:
 - a. Smooth-rubbed finish.
 - b. Grout-cleaned finish.
 - c. Cork-floated finish.
 4. Related Unformed Surfaces: At tops of walls, horizontal offsets, and similar unformed surfaces adjacent to formed surfaces, strike off smooth and finish with a texture matching adjacent formed surfaces. Continue final surface treatment of formed surfaces uniformly across adjacent unformed surfaces, unless otherwise indicated.
- H. Finishing Unformed Surfaces

1. General: Comply with ACI 302.1R for screeding, restraightening, and finishing operations for concrete surfaces. Do not wet concrete surfaces.
 2. Screed surfaces with a straightedge and strike off. Begin initial floating using bull floats or darbies to form a uniform and open-textured surface plane before excess moisture or bleedwater appears on surface.
 - a. Do not further disturb surfaces before starting finishing operations.
 3. Scratch Finish: Apply scratch finish to surfaces indicated and surfaces to receive concrete floor topping or mortar setting beds for ceramic or quarry tile, portland cement terrazzo, and other bonded cementitious floor finishes, unless otherwise indicated.
 4. Float Finish: Apply float finish to surfaces indicated, to surfaces to receive trowel finish, and to floor and slab surfaces to be covered with fluid-applied or sheet waterproofing, fluid-applied or direct-to-deck-applied membrane roofing, or sand-bed terrazzo.
 5. Trowel Finish: Apply a hard trowel finish to surfaces indicated and to floor and slab surfaces exposed to view or to be covered with resilient flooring, carpet, ceramic or quarry tile set over a cleavage membrane, paint, or another thin film-finish coating system.
 6. Trowel and Fine-Broom Finish: Apply a partial trowel finish, stopping after second troweling, to surfaces indicated and to surfaces where ceramic or quarry tile is to be installed by either thickset or thin-set methods. Immediately after second troweling, and when concrete is still plastic, slightly scarify surface with a fine broom.
 7. Nonslip Broom Finish: Apply a nonslip broom finish to surfaces indicated and to exterior concrete platforms, steps, and ramps. Immediately after float finishing, slightly roughen trafficked surface by brooming with fiber-bristle broom perpendicular to main traffic route.
- I. Concrete Protecting And Curing
1. General: Protect freshly placed concrete from premature drying and excessive cold or hot temperatures. Comply with ACI 306.1 for cold-weather protection and with **ACI 301 (ACI 301M)** for hot-weather protection during curing.
 2. Evaporation Retarder: Apply evaporation retarder to concrete surfaces if hot, dry, or windy conditions cause moisture loss approaching **0.2 lb/sq. ft. x h (1 kg/sq. m x h)** before and during finishing operations. Apply according to manufacturer's written instructions after placing, screeding, and bull floating or darbying concrete, but before float finishing.
 3. Begin curing after finishing concrete but not before free water has disappeared from concrete surface.
 4. Curing Methods: Cure formed and unformed concrete for at least seven days by one or a combination of the following methods:
 - a. Moisture Curing: Keep surfaces continuously moist for not less than seven days with the following materials:
 - 1) Water.
 - 2) Continuous water-fog spray.
 - 3) Absorptive cover, water saturated and kept continuously wet. Cover concrete surfaces and edges with **12-inch (300-mm)** lap over adjacent absorptive covers.
 - b. Moisture-Retaining-Cover Curing: Cover concrete surfaces with moisture-retaining cover for curing concrete, placed in widest practicable width, with sides and ends lapped at least **12 inches (300 mm)**, and sealed by waterproof tape or adhesive. Cure for not less than seven days. Immediately repair any holes or tears during curing period using cover material and waterproof tape.
 - c. Curing Compound: Apply uniformly in continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.
 - d. Curing and Sealing Compound: Apply uniformly to floors and slabs indicated in a continuous operation by power spray or roller according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Repeat process 24 hours later and apply a second coat. Maintain continuity of coating and repair damage during curing period.

03 - Concrete

- J. Field Quality Control
1. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
 2. Tests: Perform according to **ACI 301 (ACI 301M)**.
 - a. Testing Frequency: One composite sample shall be obtained for each day's pour of each concrete mix exceeding **5 cu. yd. (4 cu. m)** but less than **25 cu. yd. (19 cu. m)**, plus one set for each additional **50 cu. yd. (38 cu. m)** or fraction thereof.
OR
Testing Frequency: One composite sample shall be obtained for each **100 cu. yd. (76 cu. m)** or fraction thereof of each concrete mix placed each day.
- K. Repairs
1. Remove and replace concrete that does not comply with requirements in this Section.

SECTION 03 31 13 00 - PORTLAND CEMENT CONCRETE OVERLAYS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of Portland cement concrete overlays. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.

1.2 PRODUCTS

A. Coarse Aggregate:

1. Composition: Coarse aggregate shall consist of gravel, crushed gravel, crushed stone, a combination thereof, or crushed blast-furnace slag.
2. Particle Shape: Particles of the coarse aggregate shall be generally spherical or cubical in shape. The quantity of flat and elongated particles in any size group shall not exceed 20 percent by weight as determined by ASTM D 3398.
3. Gradation: The maximum size of coarse aggregate shall be the lesser of 1/4 of the pavement thickness or 2 inches nominal size. Gradation limits are specified in ASTM C 136.
4. Deleterious Substances: The amount of deleterious substances in the coarse aggregate shall not exceed the limits, defined in ASTM C 117 and C 123.

- #### B. Fine Aggregate shall consist of natural sand, manufactured sand, or a combination of natural and manufactured sand and shall be composed of clean, hard, durable particles. Particles of the fine aggregate shall be generally spherical or cubical in shape. Gradation limits are specified in ASTM C 136.

- #### C. Portland Cement shall be Type I in compliance with ASTM C 150.

- #### D. Air-Entraining Admixture shall be in compliance with ASTM C 260. Concrete mixtures shall have air content by volume of concrete of 4 to 7 percent based on measurements made immediately after discharge from the mixer.

- #### E. Concrete Mixture shall have a nominal slump of 2 inches with a maximum of 3 inches and a 28-day flexural strength of not less than 650 psi.

- #### F. Joint and Crack Sealing Materials: Joint filler, joint sealant, and crack sealant shall comply with the following:

1. Expansion Joint Fillers shall comply with ASTM D 1751 or D 1752 or shall be resin impregnated fiberboard in compliance with the physical requirements of ASTM D 1752.
2. Type I Sealant shall comply with Fed. Spec. SS-S-200, except that sealant may be furnished as a ready-mixed liquid.
3. Type II Sealant shall comply with Fed. Spec. SS-S-1401.
4. Type V Sealant shall comply with COE CRD-C-527 and may be either a single- or multiple-component material.

- #### G. Epoxy-Resin Materials: Materials used in epoxy-resin grout, mortar, and concrete shall comply with the following:

1. Epoxy-Resin Grout shall be a two-compound material formulated to comply with ASTM C 881.

03 - Concrete

2. Epoxy-Resin Concrete shall be composed of epoxy-resin binder and uniformly graded aggregate in compliance with ASTM C 144. The maximum size of aggregate shall be 3/8 or 1/2 inch.

H. Dowels shall be plain steel bars complying with ASTM A 499.

1.3 EXECUTION

A. Preparation of Existing Surface: The Contractor shall raise and reset all structures such as manhole frames, valve boxes, drainage structures, etc. to meet the required grade. Bonding course shall be applied to the area prepared to receive overlay and shall be of epoxy-resin grout and Portland cement mortar.

B. Concrete Placement: Concrete shall be placed within 45 minutes from the time all ingredients are charged into the mixing drum.

C. Vibration: In the final phases of placing, surface vibrating equipment shall be used, and the duration of vibration shall not exceed 20 seconds.

D. Joints shall be saw cut and in alignment with underlying existing joints.

E. Finishing:

1. Transverse Finishing: Immediately after placement, concrete shall be accurately struck off and screeded to such elevation that when consolidated and finished, the surface of the pavement will be free from porous places and will be at the required grade. The finishing machine shall make at least two trips over each area of pavement to compact the concrete and produce a surface of uniform texture, true to grade.
2. Longitudinal Floating: After completion of the transverse finishing, the longitudinal mechanical float shall be operated to smooth and finish the pavement to grade.
3. Hand Finishing shall be with an approved strike and tamping template and a longitudinal float.
4. Straightedge Finishing: After the longitudinal floating is completed but while the concrete is still plastic, minor irregularities and score marks in the pavement surface shall be eliminated by means of long-handled wood floats and straightedges. The final finish shall be made with the straightedges, which shall be used to float the entire pavement surface.
5. Burlap Drag Finishing: When most of the water glaze or sheen has disappeared and before the concrete becomes nonplastic, drag the surface of the pavement in the direction of the concrete placement with a multiple-ply burlap drag.
6. Edging: After other finishing has been completed, the edges of slabs along the forms and at the joints shall be carefully finished with an edging tool to form a smooth rounded surface of the required radius.

F. Concrete Curing and Protection:

1. Concrete Curing Methods shall consist of mat method, impervious sheeting method, or liquid membrane curing method.
2. Concrete Protection: Protect repaired areas against damage prior to final acceptance. Traffic shall be excluded from repaired areas.

END OF SECTION 03 31 13 00

SECTION 03 31 13 00a - STEEL REINFORCED PORTLAND CEMENT CONCRETE OVERLAYS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of steel reinforced Portland cement concrete overlays. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.

1.2 PRODUCTS

A. Coarse Aggregate:

1. Composition: Coarse aggregate shall consist of gravel, crushed gravel, crushed stone, a combination thereof, or crushed blast-furnace slag.
2. Particle Shape: Particles of the coarse aggregate shall be generally spherical or cubical in shape. The quantity of flat and elongated particles in any size group shall not exceed 20 percent by weight as determined by ASTM D 3398.
3. Gradation: The maximum size of coarse aggregate shall be the lesser of 1/4 of the pavement thickness or 2 inches nominal size. Gradation limits are specified in ASTM C 136.
4. Deleterious Substances: The amount of deleterious substances in the coarse aggregate shall not exceed the limits, defined in ASTM C 117 and C 123.

- #### B. Fine Aggregate shall consist of natural sand, manufactured sand, or a combination of natural and manufactured sand and shall be composed of clean, hard, durable particles. Particles of the fine aggregate shall be generally spherical or cubical in shape. Gradation limits are specified in ASTM C 136.

- #### C. Portland Cement shall be Type I in compliance with ASTM C 150.

- #### D. Air-Entraining Admixture shall be in compliance with ASTM C 260. Concrete mixtures shall have air content by volume of concrete of 4 to 7 percent based on measurements made immediately after discharge from the mixer.

- #### E. Concrete Mixture shall have a nominal slump of 2 inches with a maximum of 3 inches and a 28-day flexural strength of not less than 650 psi.

- #### F. Joint and Crack Sealing Materials: Joint filler, joint sealant, and crack sealant shall comply with the following:

1. Expansion Joint Fillers shall comply with ASTM D 1751 or D 1752 or shall be resin impregnated fiberboard in compliance with the physical requirements of ASTM D 1752.
2. Type I Sealant shall comply with Fed. Spec. SS-S-200, except that sealant may be furnished as a ready-mixed liquid.
3. Type II Sealant shall comply with Fed. Spec. SS-S-1401.
4. Type V Sealant shall comply with COE CRD-C-527 and may be either a single- or multiple-component material.

- #### G. Epoxy-Resin Materials: Materials used in epoxy-resin grout, mortar, and concrete shall comply with the following:

1. Epoxy-Resin Grout shall be a two-compound material formulated to comply with ASTM C 881.
2. Epoxy-Resin Concrete shall be composed of epoxy-resin binder and uniformly graded aggregate in compliance with ASTM C 144. The maximum size of aggregate shall be 3/8 or 1/2 inch.

H. Steel Reinforcement: All reinforcement shall be free from loose flaky rust, loose scale, oil, grease, mud, or other coatings that might reduce bond. Bar mats shall comply with ASTM A 184. Welded steel wire fabric shall comply with ASTM A 1064. Tie bars shall be deformed bars in compliance with ASTM A 615, A 616, or A 617. Dowels shall be plain steel bars complying with ASTM A 499.

1.3 EXECUTION

A. Preparation of Existing Surface: The Contractor shall raise and reset all structures such as manhole frames, valve boxes, drainage structures, etc. to meet the required grade. Bonding course shall be applied to the area prepared to receive overlay and shall be of epoxy-resin grout and Portland cement mortar.

B. Reinforcement Steel shall be installed by the strike-off method wherein the concrete is deposited on the subgrade and struck to the indicated elevation of the steel. The reinforcement shall be laid upon the prestruck surface.

C. Concrete Placement: Concrete shall be placed within 45 minutes from the time all ingredients are charged into the mixing drum.

D. Vibration: In the final phases of placing, surface vibrating equipment shall be used, and the duration of vibration shall not exceed 20 seconds.

E. Joints shall be saw cut and in alignment with underlying existing joints.

F. Finishing:

1. Transverse Finishing: Immediately after placement, concrete shall be accurately struck off and screeded to such elevation that when consolidated and finished, the surface of the pavement will be free from porous places and will be at the required grade. The finishing machine shall make at least two trips over each area of pavement to compact the concrete and produce a surface of uniform texture, true to grade.
2. Longitudinal Floating: After completion of the transverse finishing, the longitudinal mechanical float shall be operated to smooth and finish the pavement to grade.
3. Hand Finishing shall be with an approved strike and tamping template and a longitudinal float.
4. Straightedge Finishing: After the longitudinal floating is completed but while the concrete is still plastic, minor irregularities and score marks in the pavement surface shall be eliminated by means of long-handled wood floats and straightedges. The final finish shall be made with the straightedges, which shall be used to float the entire pavement surface.
5. Burlap Drag Finishing: When most of the water glaze or sheen has disappeared and before the concrete becomes nonplastic, drag the surface of the pavement in the direction of the concrete placement with a multiple-ply burlap drag.
6. Edging: After other finishing has been completed, the edges of slabs along the forms and at the joints shall be carefully finished with an edging tool to form a smooth rounded surface of the required radius.

G. Concrete Curing and Protection:

1. Concrete Curing Methods shall consist of mat method, impervious sheeting method, or liquid membrane curing method.
2. Concrete Protection: Protect repaired areas against damage prior to final acceptance. Traffic shall be excluded from repaired areas.

SECTION 03 31 13 00b - FIBER REINFORCED PORTLAND CEMENT CONCRETE OVERLAYS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of fiber reinforced Portland cement concrete overlays. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.

1.2 PRODUCTS

A. Coarse Aggregate:

1. Composition: Coarse aggregate shall consist of gravel, crushed gravel, crushed stone, a combination thereof, or crushed blast-furnace slag.
2. Particle Shape: Particles of the coarse aggregate shall be generally spherical or cubical in shape. The quantity of flat and elongated particles in any size group shall not exceed 20 percent by weight as determined by ASTM D 3398.
3. Gradation: The maximum size of coarse aggregate shall be the lesser of 1/4 of the pavement thickness or 2 inches nominal size. Gradation limits are specified in ASTM C 136.
4. Deleterious Substances: The amount of deleterious substances in the coarse aggregate shall not exceed the limits, defined in ASTM C 117 and C 123.

- #### B. Fine Aggregate shall consist of natural sand, manufactured sand, or a combination of natural and manufactured sand and shall be composed of clean, hard, durable particles. Particles of the fine aggregate shall be generally spherical or cubical in shape. Gradation limits are specified in ASTM C 136.

- #### C. Portland Cement shall be Type I in compliance with ASTM C 150.

- #### D. Air-Entraining Admixture shall be in compliance with ASTM C 260. Concrete mixtures shall have air content by volume of concrete of 4 to 7 percent based on measurements made immediately after discharge from the mixer.

- #### E. Concrete Mixture shall have a nominal slump of 2 inches with a maximum of 3 inches and a 28-day flexural strength of not less than 650 psi.

- #### F. Joint and Crack Sealing Materials: Joint filler, joint sealant, and crack sealant shall comply with the following:

1. Expansion Joint Fillers shall comply with ASTM D 1751 or D 1752 or shall be resin impregnated fiberboard in compliance with the physical requirements of ASTM D 1752.
2. Type I Sealant shall comply with Fed. Spec. SS-S-200, except that sealant may be furnished as a ready-mixed liquid.
3. Type II Sealant shall comply with Fed. Spec. SS-S-1401.
4. Type V Sealant shall comply with COE CRD-C-527 and may be either a single- or multiple-component material.

- #### G. Epoxy-Resin Materials: Materials used in epoxy-resin grout, mortar, and concrete shall comply with the following:

1. Epoxy-Resin Grout shall be a two-compound material formulated to comply with ASTM C 881.
2. Epoxy-Resin Concrete shall be composed of epoxy-resin binder and uniformly graded aggregate in compliance with ASTM C 144. The maximum size of aggregate shall be 3/8 or 1/2 inch.

H. Steel Fibers: The fibers shall be made from low carbon steel. The following sizes of steel are acceptable:

1. 0.010-inch x 0.022-inch flat steel fiber,
2. 0.010-inch x 0.50-inch round steel fiber,
3. 0.016-inch x 1.0-inch round steel fiber,
4. 0.016-inch x 0.75-inch round steel fiber with 0.010-inch x 0.020-inch flat section along the length of the fiber
5. 2.5-inch x 0.025-inch round steel fibers.

1.3 EXECUTION

A. Preparation of Existing Surface: The Contractor shall raise and reset all structures such as manhole frames, valve boxes, drainage structures, etc. to meet the required grade. Bonding course shall be applied to the area prepared to receive overlay and shall be of epoxy-resin grout and Portland cement mortar.

B. Reinforcement Steel shall be installed by the strike-off method wherein the concrete is deposited on the subgrade and struck to the indicated elevation of the steel. The reinforcement shall be laid upon the prestruck surface.

C. Concrete Placement: Concrete shall be placed within 45 minutes from the time all ingredients are charged into the mixing drum.

D. Vibration: In the final phases of placing, surface vibrating equipment shall be used, and the duration of vibration shall not exceed 20 seconds.

E. Joints shall be saw cut and in alignment with underlying existing joints.

F. Finishing:

1. Transverse Finishing: Immediately after placement, concrete shall be accurately struck off and screeded to such elevation that when consolidated and finished, the surface of the pavement will be free from porous places and will be at the required grade. The finishing machine shall make at least two trips over each area of pavement to compact the concrete and produce a surface of uniform texture, true to grade.
2. Longitudinal Floating: After completion of the transverse finishing, the longitudinal mechanical float shall be operated to smooth and finish the pavement to grade.
3. Hand Finishing shall be with an approved strike and tamping template and a longitudinal float.
4. Straightedge Finishing: After the longitudinal floating is completed but while the concrete is still plastic, minor irregularities and score marks in the pavement surface shall be eliminated by means of long-handled wood floats and straightedges. The final finish shall be made with the straightedges, which shall be used to float the entire pavement surface.
5. Broom Finishing: Burlap drag finishing will not be allowed as this brings the steel fibers to the surface. Finishing shall be accomplished using a stiff broom.
6. Edging: After other finishing has been completed, the edges of slabs along the forms and at the joints shall be carefully finished with an edging tool to form a smooth rounded surface of the required radius.

G. Concrete Curing and Protection:

1. Concrete Curing Methods shall consist of mat method, impervious sheeting method, or liquid membrane curing method.

2. Concrete Protection: Protect repaired areas against damage prior to final acceptance. Traffic shall be excluded from repaired areas.

END OF SECTION 03 31 13 00b

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 31 13 00c - ROLLER COMPACTED CONCRETE PAVEMENT

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of roller compacted concrete pavement. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Product Data: For each type of product indicated.

1.2 PRODUCTS

A. Cementitious Materials:

1. Portland cement shall conform to ASTM C 150, Type I. Low alkali is to be used with aggregates when directed. In lieu of low-alkali cement, the Contractor may use a combination of Portland cement that does not meet the low-alkali requirement with a suitable pozzolan or ground granulated blast-furnace slag (GGBFS) provided the following requirement is met. The expansion of the proposed combination shall be equal to or less than the expansion of a low-alkali cement meeting the requirements of ASTM C 150 when tested in conformance with ASTM C 441. These two tests shall be performed concurrently at an independent certified laboratory at the Contractor's expense. the Owner reserves the right to confirm the test results and to adjust the percentage of pozzolan or GGBFS in the combination to suit other requirements at no additional cost to the Owner. Portland cement shall be furnished in bulk.
2. Pozzolan shall conform to ASTM C 618, and, in addition, limits in Table 2A, Uniformity Requirements (for air content) shall apply to all fly ash. Table 1A, Supplementary Optional Chemical Requirement for Maximum Alkalies, shall apply when it is to be used with aggregates listed to require low-alkali cement. Pozzolan shall be furnished in bulk.
3. The temperature of the cementitious materials as delivered to the site shall not exceed 150 degrees F.

B. Admixtures: All chemical admixtures furnished as liquids shall be in a solution of suitable viscosity and dilution for field use as determined by the Owner.

1. Water-Reducing Admixture (WRA) shall meet the requirements of ASTM C 494, Type D.
2. Air-entraining admixture shall conform to ASTM C 260.

C. Water for washing aggregates and for mixing and curing concrete shall be free from injurious amounts of oil, acid, salt, alkali, organic matter, or other deleterious substances and shall comply with COE CRD-C 400.

D. Aggregates

1. Composition: Fine aggregate shall consist of natural sand, manufactured sand, or a combination of natural and manufactured sands. Coarse aggregate shall consist of gravel, crushed gravel, crushed stone, air-cooled blast-furnace slag, or a combination thereof.

OR

All concrete mixtures will be proportioned by the Owner except that proportions for the slipformed facing concrete mixture will be selected by the Contractor. RCC shall be composed of cementitious materials, water, fine and coarse aggregates, and possibly admixtures. The cementitious material shall be portland cement, or portland cement in combination with pozzolan. An admixture when approved or directed will be a water-reducing/retarding admixture. Air-entraining admixture will be used in the bedding concrete and other conventional concrete.

1.3 EXECUTION

- A. Concrete Mixing Plant: A continuous mixing plant(s) shall be capable of producing RCC of the same quality and uniformity as would be produced in a conventional redi-mix batch plant and shall be capable of producing a uniform continuous product (at both maximum and minimum production rates) that is mixed so that complete intermingling of all ingredients occurs without balling, segregation, and wet or dry portions.
- B. Trucks: Truck mixers or agitators used for transporting central-mixed conventional concrete shall conform to the applicable requirements of ASTM C 94. Truck mixers shall not be used to transport concrete with larger than 37.5 mm (1-1/2-inch) nominal maximum size aggregate (NMSA) or 2 inch slump, or less. Nonagitator trucks may be used for transporting conventional central-mixed concrete over a smooth road when the hauling time is less than 15 minutes and the slump is less than 3 inches. Bodies of nonagitator trucks shall be smooth, water-tight, metal containers specifically designed to transport concrete, shaped with rounded corners to minimize segregation.
- C. Belt Conveyors: Belt conveyors shall be designed and operated to assure a uniform flow of concrete from mixer or delivery truck to final place of deposit without segregation of ingredients or loss of mortar and shall be provided with positive means for preventing segregation of the concrete or loss of mortar at transfer points and the point of placing. The NMSA required in mixture proportions furnished by the Owner will not be changed to accommodate the belt width.
- D. Spreading and Remixing Equipment: The primary spreading procedure shall be accomplished by dozer. Graders or other equipment not specified may be used to facilitate the RCC spreading process only when approved. For open, unrestricted areas, the dozer shall be a minimum size and weight equivalent to a Caterpillar D-6. For restricted placement areas, such as placement of RCC near the dam crest or next to abutments, the dozer shall have as a minimum a size and weight equivalent to a Caterpillar D-4. There shall be a minimum of one operating dozer for each 200 cubic yards of RCC placed each hour. The dozers shall be equipped with well-maintained grousers. A front-end loader with operator shall be available to assist with deposition and spreading of RCC as needed in confined areas. The equipment shall be maintained in good operating condition. The equipment shall not leak or drip oil, grease, or other visible contaminants onto the RCC surface. All equipment used for spreading and remixing that leaves the surface of the structure for maintenance or repairs or, for any other reason, must be cleaned of all contaminants by an approved method before returning to the structure surface. Under no conditions shall a dozer or other tracked vehicle be operated on other than fresh uncompacted RCC except to facilitate startup operations for each lift and by approved procedures.
- E. Compaction Equipment:
1. Self-propelled vibratory rollers shall be used for primary rolling and shall be double-drum. They shall transmit a dynamic impact to the surface through a smooth steel drum by means of revolving weights, eccentric shafts, or other equivalent methods. The compactor shall have a minimum gross mass of 20,000 pounds and shall produce a minimum dynamic force of 350 pounds per linear inch of drum width. The operating frequency shall be variable in the approximate range of 1,700 to 3,000 cycles per minute. The amplitude shall be adjustable between 0.015 and 0.04 inches. The roller shall be capable of full compaction in both forward and reverse directions. The roller shall be operated at speeds not exceeding 2.2 ft/s. Within the range of the operating capability of the equipment, the Owner may direct or approve variations to the frequency, amplitude, and speed of operation which result in the specified density at the fastest production rate.
 2. Small vibratory rollers shall be used to compact the RCC where the larger vibratory rollers specified above cannot maneuver. The rollers shall compact the RCC to the required density and shall be so demonstrated during construction of the test section. Small vibratory rollers cannot compact the RCC to the same density and thickness as the primary rollers. When small rollers are used, total lift thickness of the RCC layer or lift shall be reduced to not over 6 inches

- uncompacted thickness to permit adequate compaction. Rollers shall have independent speed and vibration controls and shall be capable of a wide range of speed adjustments.
3. The tampers shall compact the RCC to the required density and shall be so demonstrated during construction of the test section. Tampers cannot compact the RCC to the same density and thickness as the primary rollers. When tampers are used, thickness of each RCC layer that is to be compacted shall be reduced to not more than 6 inches uncompacted thickness to assure adequate compaction.
- F. **Placing During Rain:** RCC shall not be placed during rainfall of 0.1 inch/hr or more. During periods of lesser rainfall, placement of RCC may continue if, in the opinion of the Owner, no damage to the RCC is occurring. Work shall commence only after excess free surface water and contaminated paste or RCC have been removed. The surface shall have gained sufficient strength (no less than 4 hours after the RCC placement was suspended) to prevent rutting, pumping, intermixing of rainwater with the RCC, or other damage to the RCC. When the RCC surface has been contaminated or damaged in any manner, the RCC surface shall be washed to break up and remove laitance and/or mud-like coatings from the surface. Any undercut coarse aggregate shall be removed. All waste shall be removed and disposed of in an approved manner.
- G. **Hot-Weather Placement:** In hot-weather placement the temperature of the RCC shall be controlled so that it does not exceed 75.0 degrees F when placed. Placement shall be suspended as soon as the RCC temperature exceeds 75 degrees F. Measures that can be taken to prevent temperatures exceeding 75 degrees F include, but are not limited to; 1.) chilling mixing water, 2.) sprinkling aggregate stockpiles, 3.) use of a canopy to shade the RCC placement areas, 4.) placing during nighttime and early morning hours, or 5.) restricting placements to cloudy days. Use of any of these systems shall not be reason for extension of completion dates specified in these specifications. In addition, to prevent potential damage to the RCC due to hot-weather related placement conditions, all RCC operation shall be suspended between June 15 and October 31, unless directed otherwise.

SECTION 03 35 23 00 - EXPOSED AGGREGATE CONCRETE FINISHING

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of exposed aggregate surface concrete walls. Products shall match existing materials and/or shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Submittals

1. Submit product data and manufacturer's application instruction.
2. Shop drawings shall be submitted for approval.

1.2 PRODUCTS

A. Concrete Materials and Mixing

1. Portland Cement: ASTM C 150, Type 1 or 1A.
 - a. Shrinkage-Compensating Cement: Portland cement containing a stable expansive chemical compound such as calcium sulfoaluminate.
 - b. Aggregate: ASTM C 33; aggregate for exposed aggregate concrete shall match existing, if appropriate.
 - c. Admixtures: Submit manufacturer's literature for all admixtures proposed for the work.
 - d. Curing Compounds: ASTM C 309, Type 1.
 - e. Epoxy Bonding Agent: Sika or approved equal.

B. Concrete Formwork, Reinforcement, and Accessories

1. Formwork: Plywood form and liners shall be minimum grade B-B High Density Concrete Form Overlay, Class I, complying with ANSI A199.1.
2. Reinforcement:
 - a. Reinforcement Bars: ASTM A 615, Grade 40 or Grade 60.
 - b. Welded Wire Fabric: ASTM A 1064. Where welded wire fabric is needed, use No. 6 gauge wire at 6-inch spacing in each direction.
 - c. Accessories for proper installation of reinforcement shall comply with CRSI "Manual of Standard Practice for Reinforced Concrete Construction."
 - d. Reinforcement fabrication shall comply with ACI 318 and ACI 315.

C. Curing and Climatic Conditions

1. Comply with ACI 306 and ACI 305 for protecting and curing concrete in cold and hot weather.
2. Immediately after finishing, begin curing flatwork by covering with constantly saturated moisture retaining fabrics, impervious sheeting, or membrane curing compounds.
3. Apply membrane curing compounds as required.

1.3 EXECUTION

A. Preparation when attaching to existing surfaces:

1. Remove all defective material by chipping and cutting to sound concrete in order to secure a solid foundation.
2. Square cut or undercut the edges to a minimum depth of one inch to form key.
3. Cut concrete out from behind exposed reinforcing bars and rods.
4. All exposed reinforcing shall be cleaned of rust and primed.

03 - Concrete

- B. Installation
1. Formwork requirements:
 - a. Formwork shall comply with ACI 347. Joints in forms shall be horizontal or vertical.
 - b. Use plywood, fiberglass, or metal forms.
 2. Reinforcement shall be repaired when rusted through. Rods at least 12 inches long shall be wired to the failed rods. In closing gaps, rods shall lap existing rods by at least 12 inches or 30 diameters, whichever is greater.
 3. Mixing and transporting concrete: Ready-mixed concrete shall be mixed and delivered to the project in compliance with ASTM C 94. Job-mixed concrete shall comply with the requirements of ACI 318.
 4. Mixing epoxy-resin patching mortar: Mix thoroughly with a power mixer at low speeds (150 - 400 rpm) until material attains uniform color and consistency (minimum time of two to three minutes at 70 F).

SECTION 03 37 13 00 - SHOTCRETE

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for shotcrete. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes shotcrete applied by dry-mix or wet-mix process.

C. Definitions

1. Shotcrete: Mortar or concrete pneumatically projected onto a surface at high velocity.
2. Dry-Mix Shotcrete: Shotcrete with most of the water added at nozzle.
3. Wet-Mix Shotcrete: Shotcrete with ingredients, including mixing water, mixed before introduction into delivery hose.

D. Submittals

1. Product Data: For manufactured materials and products including reinforcement and forming accessories, shotcrete materials, admixtures, and curing compounds.
2. LEED Submittal:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - 1) Include statement indicating costs for each product having recycled content.
3. Shop Drawings: For details of fabricating, bending, and placing reinforcement. Include support and anchor details, number and location of splices, and special reinforcement required for openings through shotcrete structures.
4. Samples: Approximately **24 by 24 by 2 inches (600 by 600 by 50 mm)**, to illustrate quality of finishes, colors, and textures of exposed surfaces of shotcrete.
5. Design Mixes: For each shotcrete mix.
6. Material Test Reports: For shotcrete materials.
7. Material Certificates: For each material item, signed by manufacturers.
8. Field quality-control test reports.

E. Quality Assurance

1. Installer Qualifications: A qualified installer employing nozzle operators for the Project, each of whom attains mean core grades not exceeding 2.5, according to ACI 506.2, on preconstruction tests **OR** is ACI Shotcrete Nozzleman certified in Dry-Mix Process for Vertical Position **OR** is ACI Shotcrete Nozzleman certified in Dry-Mix Process for Vertical and Overhead Positions **OR** is ACI Shotcrete Nozzleman certified in Wet-Mix Process for Vertical Position **OR** is ACI Shotcrete Nozzleman certified in Wet-Mix Process for Vertical and Overhead Positions as appropriate to the required shotcrete work, **as directed**.
2. Testing Agency Qualifications: An independent agency qualified according to ASTM C 1077 and ASTM E 329 for testing indicated, and acceptable to authorities having jurisdiction, **as directed**.
3. Comply with provisions of the following, unless more stringent requirements are indicated:
 - a. ACI 301, "Specifications for Structural Concrete."
 - b. ACI 506.2, "Specification for Shotcrete."
4. Preinstallation Conference: Conduct conference at Project site.
5. Shotcrete Testing Service: Engage a qualified independent testing agency to perform material evaluation tests and to design shotcrete mixtures.

F. Project Conditions

1. Cold-Weather Shotcreting: Protect shotcrete work from physical damage or reduced strength caused by frost, freezing, or low temperatures according to ACI 306.1 and as follows:
 - a. Discontinue shotcreting when ambient temperature is 40 deg F (4.4 deg C) and falling. Uniformly heat water and aggregates before mixing to obtain a shotcrete shooting temperature of not less than 50 deg F (10 deg C) and not more than 90 deg F (32 deg C).
 - b. Do not use frozen materials or materials containing ice or snow.
 - c. Do not place shotcrete on frozen surfaces or surfaces containing frozen materials.
 - d. Do not use calcium chloride, salt, or other materials containing antifreeze agents.
2. Hot-Weather Shotcreting: Mix, place, and protect shotcrete according to ACI 305R when hot-weather conditions and high temperatures would seriously impair quality and strength of shotcrete, and as follows:
 - a. Cool ingredients before mixing to maintain shotcrete temperature at time of placement below 100 deg F (38 deg C) for dry mix or 90 deg F (32 deg C) for wet mix.
 - b. Reduce temperature of reinforcing steel and receiving surfaces below 100 deg F (38 deg C) before shotcreting.

1.2 PRODUCTS

A. Form Materials

1. Forms: Form-facing panels that will provide continuous, straight, smooth, concrete surfaces. Furnish panels in largest practicable sizes to minimize number of joints.

B. Reinforcing Materials

1. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 **OR** 60, **as directed** percent.
2. Reinforcing Bars: ASTM A 615/A 615M, Grade 60 (Grade 420), deformed.
3. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M, deformed.
4. Galvanized Reinforcing Bars: ASTM A 767/A 767M, Class II, zinc coated, hot-dip galvanized after fabrication and bending, as follows:
 - a. Steel Reinforcement: ASTM A 615/A 615M, Grade 60 (Grade 420) **OR** ASTM A 706/A 706M, **as directed**, deformed.
5. Plain-Steel Wire: ASTM A 82, as drawn **OR** galvanized, **as directed**.
6. Plain-Steel-Welded Wire Fabric: ASTM A 1064, fabricated from as-drawn **OR** galvanized, **as directed**, steel wire into flat sheets.
7. Deformed-Steel-Welded Wire Fabric: ASTM A 497, flat sheet.
8. Supports: Bolsters, chairs, spacers, ties, and other devices for spacing, supporting, and fastening reinforcing steel in place according to CRSI's "Manual of Standard Practice" and as follows:
 - a. For uncoated reinforcement, use all-plastic **OR** CRSI Class 1, plastic-protected **OR** CRSI Class 2, stainless-steel, **as directed**, bar supports.
 - b. For zinc-coated reinforcement, use galvanized wire or dielectric-polymer-coated wire **OR** all-plastic, **as directed**, bar supports.
 - c. Retain paragraph and subparagraph below if devices are required to anchor, support, or space steel reinforcement.
9. Reinforcing Anchors: ASTM A 36/A 36M, unheaded rods or ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6), hex-head bolts; carbon steel; and carbon-steel nuts.
 - a. Finish: Plain, uncoated **OR** Hot-dip zinc coating, ASTM A 153/A 153M, Class C, **as directed**.

C. Shotcrete Materials

1. Portland Cement: ASTM C 150, Type I **OR** III, **as directed**. Use only one brand and type of cement for Project.

- a. Fly Ash: ASTM C 618, Class C or F.
 - b. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
 2. Blended Hydraulic Cement: ASTM C 595, Type IS **OR** IP **OR** I(PM) **OR** I(SM), **as directed**.
 3. Silica Fume: ASTM C 1240, amorphous silica.
 4. Normal-Weight Aggregates: ASTM C 33, from a single source, and as follows:
 - a. Aggregate Gradation: ACI 506R, Gradation No. 1 with 100 percent passing **3/8-inch (10-mm)** **OR** 2 with 100 percent passing **1/2-inch (13-mm)**, **as directed**, sieve.
 - b. Coarse-Aggregate Class: 3S **OR** 3M **OR** 1N, **as directed**.
 5. Lightweight Aggregates: ASTM C 330.
 - a. Aggregate Gradation: ACI 506R, Gradation No. 1 with 100 percent passing **3/8-inch (10-mm)** **OR** 2 with 100 percent passing **1/2-inch (13-mm)**, **as directed** sieve.
 6. Coloring Agent: ASTM C 979, synthetic mineral-oxide pigments or colored, water-reducing admixtures, free of carbon black; color stable, nonfading, and resistant to lime and other alkalis.
 - a. Color: As indicated by manufacturer's designation **OR** Match the Owner's sample **OR** As selected by the Owner from manufacturer's full range, **as directed**.
 7. Water: Potable, complying with ASTM C 94/C 94M, free from deleterious materials that may affect color stability, setting, or strength of shotcrete.
 8. Carbon-Steel Fiber: ASTM C 1116, Type 1, carbon-steel fiber and ASTM A 820, Type 1, cold-drawn wire **OR** cut sheet, **as directed**, not less than **1 inch (25 mm)** long.
 9. Synthetic Fiber: Fibrillated polypropylene fibers engineered and designed for use in shotcrete, complying with ASTM C 1116, Type III, not less than **3/4 inch (19 mm)** long.
 10. Ground Wire: High-strength steel wire, 0.8 to 1 mm in diameter.
 11. Joint Filler Strips: ASTM D 1751, asphalt-saturated cellulosic fiber or ASTM D 1752, cork or self-expanding cork.
- D. Chemical Admixtures
1. General: ASTM C 1141, Class A or B, but limited to the following admixture materials. Provide admixtures for shotcrete that contains not more than 0.1 percent chloride ions. Certify compatibility of admixtures with each other and with other cementitious materials.
 - a. Air-Entraining Admixture: ASTM C 260.
 - b. Water-Reducing Admixture: ASTM C 494/C 494M, Type A.
 - c. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 - d. Water-Reducing and Accelerating Admixture: ASTM C 494/C 494M, Type E.
 - e. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
 - f. Accelerating Admixture: ASTM C 494/C 494M, Type C.
- E. Curing Materials
1. Absorptive Cover: AASHTO M 182, Class 2, burlap cloth made from jute or kenaf, weighing approximately **9 oz./sq. yd. (305 g/sq. m)** dry.
 2. Moisture-Retaining Cover: ASTM C 171, polyethylene film or white burlap-polyethylene sheet.
 3. Water: Potable.
 4. Clear, Waterborne **OR** Solvent-Borne, **as directed**, Membrane-Forming Curing Compound: ASTM C 309, Type 1, Class B.
- F. Shotcrete Mixtures, General
1. Prepare design mixes for each type and strength of shotcrete.
 - a. Limit use of fly ash **OR** ground granulated blast-furnace slag **OR** silica fume, **as directed**, to not exceed, in combination, 25 percent of portland cement by weight.
 2. Limit water-soluble chloride ions to maximum percentage by weight of cement or cementitious materials permitted by ACI 301.
 3. Admixtures: When included in shotcrete design mixes, use admixtures and retarding admixtures according to manufacturer's written instructions.
 4. Carbon-Steel Fiber: Uniformly disperse in shotcrete mix, according to manufacturer's written instructions, at a rate of **50 lb/cu. yd. (30 kg/cu. m)** **OR** **100 lb/cu. yd. (60 kg/cu. m)**, **as directed**.
 5. Synthetic Fiber: Uniformly disperse in shotcrete mix, according to manufacturer's written instructions, at a rate of **1.5 lb/cu. yd. (0.90 kg/cu. m)** **OR** **5 lb/cu. yd. (3 kg/cu. m)**, **as directed**.

6. Design-Mix Adjustments: Subject to compliance with requirements, shotcrete design-mix adjustments may be proposed when characteristics of materials, Project conditions, weather, test results, or other circumstances warrant.

G. Shotcrete Mixtures

1. Proportion dry mixtures by field test data methods and wet mixtures according to ACI 211.1 and ACI 301, using materials to be used on Project, to provide shotcrete with the following properties:
 - a. Compressive Strength (28 Days): **5000 psi (34.5 MPa) OR 4500 psi (31 MPa) OR 4000 psi (27.6 MPa) OR 3500 psi (24.1 MPa), as directed.**
 - b. Add air-entraining admixture at manufacturer's prescribed rate to result in normal-weight, wet-mix shotcrete having an air content before pumping of **7 OR 8, as directed**, percent with a tolerance of plus or minus 1-1/2 percent.

H. Shotcrete Equipment

1. Mixing Equipment: Capable of thoroughly mixing shotcrete materials in sufficient quantities to maintain continuous placement.
2. Dry-Mix Delivery Equipment: Capable of discharging aggregate-cement mixture into delivery hose under close control and maintaining continuous stream of uniformly mixed materials at required velocity to discharge nozzle. Equip discharge nozzle with manually operated water-injection system for directing even distribution of water to aggregate-cement mixture.
 - a. Provide uniform, steady supply of clean, compressed air to maintain constant nozzle velocity while simultaneously operating blow pipe for cleaning away rebound.
 - b. Provide water supply with uniform pressure at discharge nozzle to ensure uniform mixing with aggregate-cement mix. Provide water pump to system if line water pressure is inadequate.
3. Wet-Mix Delivery Equipment: Capable of discharging aggregate-cement-water mixture accurately, uniformly, and continuously.

I. Batching And Mixing

1. Dry-Mix Process: Measure mix proportions by weight batching according to ASTM C 94/C 94M or by volume batching complying with ASTM C 685/C 685M requirements.
 - a. In volume batching, adjust fine-aggregate volume for bulking. Test fine-aggregate moisture content at least once daily to determine extent of bulking.
 - b. Prepackaged shotcrete materials may be used at Contractor's option. Predampen prepackaged shotcrete materials and mix before use.
2. Wet-Mix Process: Measure, batch, mix, and deliver shotcrete according to ASTM C 94/C 94M and ASTM C 1116, **as directed**, and furnish batch ticket information.
 - a. Comply with ASTM C 685/C 685M when shotcrete ingredients are delivered dry and proportioned and mixed on-site.

1.3 EXECUTION

A. Preparation

1. Concrete or Masonry: Before applying shotcrete, remove unsound or loose materials and contaminants that may inhibit shotcrete bonding. Chip or scarify areas to be repaired to extent necessary to provide sound substrate. Cut edges square and **1/2 inch (13 mm)** deep at perimeter of work, tapering remaining shoulder at 1:1 slope into cavity to eliminate square shoulders. Dampen surfaces before shotcreting.
 - a. Abrasive blast or hydroblast existing surfaces that do not require chipping to remove paint, oil, grease, or other contaminants and to provide roughened surface for proper shotcrete bonding.
2. Earth: Compact and trim to line and grade before placing shotcrete. Do not place shotcrete on frozen surfaces. Dampen surfaces before shotcreting.

3. Rock: Clean rock surfaces of loose materials, mud, and other foreign matter that might weaken shotcrete bonding.
 4. Steel: Clean steel surfaces by abrasive blasting according to SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
- B. Forms
1. General: Design, erect, support, brace, and maintain forms, according to ACI 301, to support shotcrete and construction loads and to facilitate shotcreting. Construct forms so shotcrete members and structures are secured to prevent excessive vibration or deflection during shotcreting.
 - a. Fabricate forms to be readily removable without impact, shock, or damage to shotcrete surfaces and adjacent materials.
 - b. Construct forms to required sizes, shapes, lines, and dimensions using ground wires and depth gages to obtain accurate alignment, location, and grades in finished structures. Construct forms to prevent mortar leakage but permit escape of air and rebound during shotcreting. Provide for openings, offsets, blocking, screeds, anchorages, inserts, and other features required in the Work.
 2. Form openings, chases, recesses, bulkheads, keyways, and screeds in formwork. Determine sizes and locations from trades providing such items. Accurately place and securely support items built into forms.
- C. Steel Reinforcement
1. General: Comply with CRSI's "Manual of Standard Practice" for fabricating, placing, and supporting reinforcement.
 2. Clean reinforcement of loose rust and mill scale, earth, ice, and other materials that weaken shotcrete bonding.
 3. Securely embed reinforcing anchors into existing substrates, located as required.
 4. Accurately position, support, and rigidly secure reinforcement against displacement by formwork, construction, or shotcreting. Locate and support reinforcement by metal chairs, runners, bolsters, spacers, and hangers, as required.
 5. Place reinforcement to obtain minimum coverage for shotcrete protection. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position during shotcreting. Set wire ties with ends directed into shotcrete, not toward exposed shotcrete surfaces.
 6. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh and lace splices with wire. Offset laps of adjoining widths to prevent continuous laps in either direction.
- D. Joints
1. Construction Joints: Locate and install construction joints tapered to a 1:1 slope where joint is not subject to compression loads and square where joint is perpendicular to main reinforcement. Continue reinforcement through construction joints, unless otherwise indicated.
 2. Contraction Joints: Construct contraction joints in shotcrete using saw cuts **1/8-inch- (3-mm-)** wide-by-1/3 slab depth or joint-filler strips **1/4-inch- (6-mm-)** wide-by-1/3 shotcrete depth, unless otherwise indicated.
 - a. After shotcrete has cured, remove strip inserts and clean groove of loose debris.
 - b. Space joints at **15 feet (4.5 m)** o.c. **OR** centers indicated, **as directed**, horizontally and vertically.
 - c. Tool edges round on each side of strip inserts if floated or troweled finishes are required.
- E. Alignment Control
1. Ground Wires: Install ground wires to establish thickness and planes of shotcrete surfaces. Install ground wires at corners and offsets not established by forms. Pull ground wires taut and position adjustment devices to permit additional tightening.
- F. Embedded Items

1. Place and secure anchorage devices and other embedded items required for adjoining work that is attached to or supported by shotcrete. Use setting drawings, templates, diagrams, instructions, and directions furnished with items to be embedded.

G. Application

1. Apply temporary protective coverings and protect adjacent surfaces against deposit of rebound and overspray or impact from nozzle stream.
2. Moisten wood forms immediately before placing shotcrete where form coatings are not used.
3. Apply shotcrete according to ACI 506.2.
4. Apply dry-mix shotcrete materials within 45 minutes after predampening and wet-mix shotcrete materials within 90 minutes after batching.
5. Deposit shotcrete continuously in multiple passes, to required thickness, without cold joints and laminations developing. Place shotcrete with nozzle held perpendicular to receiving surface. Begin shotcreting in corners and recesses.
6. Remove and dispose of rebound and overspray materials during shotcreting to maintain clean surfaces and to prevent rebound entrapment.
7. Maintain reinforcement in position during shotcreting. Place shotcrete to completely encase reinforcement and other embedded items. Maintain steel reinforcement free of overspray and prevent buildup against front face during shotcreting.
8. Do not place subsequent lifts until previous lift of shotcrete is capable of supporting new shotcrete.
9. Do not permit shotcrete to sag, slough, or dislodge.
10. Remove hardened overspray, rebound, and laitance from shotcrete surfaces to receive additional layers of shotcrete; dampen surfaces before shotcreting.
11. Do not disturb shotcrete surfaces before beginning finishing operations.
12. Remove ground wires or other alignment control devices after shotcrete placement.
13. Shotcrete Core Grade: Apply shotcrete to achieve mean core grades not exceeding 2.5 according to ACI 506.2, with no single core grade exceeding 3.0.
14. Installation Tolerances: Place shotcrete without exceeding installation tolerances permitted by ACI 117R, increased by a factor of 2.

H. Surface Finishes

1. General: Finish shotcrete according to descriptions in ACI 506R for the following finishes:
2. Natural Finish:
 - a. Gun Finish: Natural undisturbed finish.
 - b. Rod Finish: Rough-textured finish obtained by cutting or screeding exposed face of shotcrete to plane by rod or straightedge after initial set, and wood-float finished **OR** and steel-trowel finished **as directed**.
 - c. Broom Finish: Rough-textured finish obtained by screeding exposed face of shotcrete to required plane by rod, cutting screed, or trowel, and brooming after initial set.
3. Flash-Coat Finish: After screeding and rodding surface, apply up to **1/4-inch (6-mm)** coat of shotcrete using ACI 506R, Gradation No. 1, fine-screened sand modified with maximum aggregate size not exceeding **No. 4 (4.75-mm)** sieve to provide a finely textured finish.
4. Flash-Coat and Final Finish: After screeding and rodding surface, apply up to **1/4-inch (6-mm)** coat of shotcrete using ACI 506R, Gradation No. 1, fine-screened sand modified with maximum aggregate size not exceeding **No. 4 (4.75-mm)** sieve and apply wood-float **OR** rubber-float **OR** brush-float **OR** steel-trowel, **as directed**, finish.
5. Finish-Coat Finish: After screeding and rodding surface, apply shotcrete finish coat, **1/4 to 1 inch (6 to 25 mm)** thick, using ACI 506R, Gradation No. 1, fine-screened sand modified with maximum aggregate size not exceeding **No. 4 (4.75-mm)** sieve to provide a finish of uniform texture and appearance.
6. Finish-Coat and Final Finish: After screeding and rodding surface, apply shotcrete finish coat, **1/4 to 1 inch (6 to 25 mm)** thick, using ACI 506R, Gradation No. 1, fine-screened sand modified with

maximum aggregate size not exceeding **No. 4 (4.75-mm)** sieve and apply wood-float **OR** rubber-float **OR** brush-float **OR** steel-trowel, **as directed**, finish.

- I. Curing
 1. Protect freshly placed shotcrete from premature drying and excessive cold or hot temperatures.
 2. Start initial curing as soon as free water has disappeared from shotcrete surface after placing and finishing.
 3. Curing Exposed Surfaces: Cure shotcrete by one of the following methods:
 - a. Moisture Curing: Keep surfaces continuously moist for at least seven days with water, continuous water-fog spray, water-saturated absorptive covers, or moisture-retaining covers. Lap and seal sides and ends of covers.
 - b. Curing Compound: Apply curing compound uniformly in continuous operation by power spray according to manufacturer's written instructions. Recoat areas subjected to heavy rainfall within three hours after initial application. Maintain continuity of coating and repair damage during curing period.
 - 1) Apply curing compound to natural- or gun-finished shotcrete at rate of **1 gal./100 sq. ft. (1 L/2.5 sq. m)**.
 4. Curing Formed Surfaces: Cure formed shotcrete surfaces by moist curing with forms in place for full curing period or until forms are removed. If forms are removed, continue curing by methods specified above, as applicable.
- J. Form Removal
 1. Forms not supporting weight of shotcrete may be removed after curing at not less than **50 deg F (10 deg C)** for 24 consecutive hours after gunning, provided shotcrete is hard enough not to be damaged by form-removal operations and provided curing and protecting operations are maintained.
 - a. Leave forms supporting weight of shotcrete in place until shotcrete has attained design compressive strength. Determine compressive strength of in-place shotcrete by testing representative field-cured specimens of shotcrete.
 - b. Remove forms only if shores have been arranged to permit removal of forms without loosening or disturbing shores.
 2. Clean and repair surfaces of forms to be reused in the Work. Split, frayed, delaminated, or otherwise damaged form-facing materials are unacceptable for exposed surfaces. Apply new form-coating compound as specified for new formwork.
- K. Field Quality Control
 1. Engage a qualified independent testing agency to sample materials, visually grade cores, perform tests, and submit reports during shotcreting.
 2. Air Content: ASTM C 173/C 173M, volumetric method or ASTM C 231, pressure method; 1 test for each compressive-strength test for each mix of air-entrained, wet-mix shotcrete measured before pumping.
 3. Shotcrete Temperature: ASTM C 1064/C 1064M; 1 test hourly when air temperature is **40 deg F (4.4 deg C)** and below and when **80 deg F (27 deg C)** and above, and 1 test for each set of compressive-strength specimens.
 4. Test Panels: Make a test panel, reinforced as in structure, for each shotcrete mix and for each workday or for every **50 cu. yd. (38 cu. m)** of shotcrete placed; whichever is less. Produce test panels with dimensions of **24 by 24 inches (600 by 600 mm)** minimum and of average thickness of shotcrete, but not less than **4-1/2 inches (115 mm)**. From each test panel, testing agency will obtain six test specimens: one set of three specimens unreinforced and one set of three specimens reinforced.
 - a. Test each set of unreinforced specimens for compressive strength according to ASTM C 1140 and construction testing requirements in ACI 506.2.
 - b. Visually inspect each set of reinforced shotcrete cores taken from test panels and determine mean core grades according to ACI 506.2.

5. In-Place Shotcrete: Take a set of 3 unreinforced cores for each mix and for each workday or for every 50 cu. yd. (38 cu. m) of shotcrete placed; whichever is less. Test cores for compressive strength according to ACI 506.2 and ASTM C 42. Do not cut steel reinforcement.
 6. Strength of shotcrete will be considered satisfactory when mean compressive strength of each set of 3 unreinforced cores equals or exceeds 85 percent of specified compressive strength, with no individual core less than 75 percent of specified compressive strength.
 - a. Mean compressive strength of each set of 3 unreinforced cubes shall equal or exceed design compressive strength with no individual cube less than 88 percent of specified compressive strength.
- L. Repairs
1. Remove and replace shotcrete that is delaminated or exhibits laminations, voids, or sand/rock pockets exceeding limits for specified core grade of shotcrete.
 - a. Remove unsound or loose materials and contaminants that may inhibit bond of shotcrete repairs. Chip or scarify areas to be repaired to extent necessary to provide sound substrate. Cut edges square and 1/2 inch (13 mm) deep at perimeter of work, tapering remaining shoulder at 1:1 slope into cavity to eliminate square shoulders. Dampen surfaces and apply new shotcrete.
 2. Repair core holes from in-place testing according to repair provisions in ACI 301 and match adjacent finish, texture, and color.
- M. Cleaning
1. Remove and dispose of rebound and overspray materials from final shotcrete surfaces and areas not intended for shotcrete placement.

END OF SECTION 03 37 13 00

SECTION 03 37 13 00a - GLASS-FIBER-REINFORCED CONCRETE (GFRC)

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for glass-fiber-reinforced precast concrete panels. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section includes glass-fiber-reinforced concrete (GFRC) panels consisting of GFRC panel frames, anchors, and connection hardware.
 - a. GFRC panels include wall units, window wall units, mullions, column covers, fascia units, cornices, and soffits.

C. Definitions

1. Design Reference Sample: Sample of approved GFRC color, finish, and texture; preapproved by the Owner.

D. Performance Requirements

1. Structural Performance: Provide GFRC panels, including panel frames, anchors, and connections, capable of withstanding the following design loads as well as the effects of thermal- and moisture-induced volume changes, according to load factors and combinations established in PCI MNL 128, "Recommended Practice for Glass Fiber Reinforced Concrete Panels."
 - a. Design Loads: As required to meet Project requirements.
 - b. Deflection Limits: Design panel frames to withstand design loads without lateral deflections greater than 1/240 of wall span.
 - c. Thermal Movements: Provide for thermal movements resulting from annual ambient temperature changes of 100 deg F (56 deg C).
 - d. Design panel frames and connections to accommodate deflections and other building movements.
 - e. Design panel frames to transfer window loads to building structure.

E. Submittals

1. Product Data: For each type of product indicated. Include GFRC design mixes.
2. Shop Drawings: Show fabrication and installation details for GFRC panels including the following:
 - a. Structural analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
 - b. Panel elevations, sections, and dimensions.
 - c. Thickness of facing mix, GFRC backing, and bonding pads for typical panels.
 - d. Finishes.
 - e. Joint and connection details.
 - f. Erection details.
 - g. Panel frame details for typical panels including sizes, spacings, thickness, and yield strength of various members.
 - h. Location and details of connection hardware attached to structure.
 - i. Size, location, and details of flex, gravity, and seismic anchors for typical panels.
 - j. Other items sprayed into panels.
 - k. Erection sequence for special conditions.
 - l. Relationship to adjacent materials.
 - m. Description of loose, cast-in, and field hardware.

3. Samples: Representative of finished exposed face of GFRC showing the full range of colors and textures specified, **12 by 12 inches (305 by 305 mm)** and of actual thickness.
4. Qualification Data: For qualified GFRC manufacturer, including proof of current Precast/Prestressed Concrete Institute (PCI) or Architectural Precast Association (APA) Plant Certification.
5. Welding certificates.
6. Steel Sheet Certification: For steel sheet used in cold-formed steel panel framing.
7. Mill Certificates: For structural-steel shapes and hollow structural sections used in panel framing.
8. Source Quality-Control Program: For GFRC manufacturer.
9. Source Quality-Control Test Reports: For GFRC, inserts, and anchors.

F. Quality Assurance

1. Manufacturer Qualifications: A qualified manufacturer that participates in PCI's Plant Certification Program and is designated a PCI-Certified Plant for Group G - Glass Fiber Reinforced Concrete or that participates in APA's Plant Certification Program and is certified for GFRC production.
 - a. Manufacturer's responsibility includes fabricating and installing GFRC panels and providing professional engineering services needed to assume engineering responsibility for GFRC panels.
 - b. Engineering responsibility includes preparation of Shop Drawings and comprehensive engineering analysis, based on GFRC production test values, by a qualified professional engineer experienced in GFRC design.
2. Steel Sheet Certifications: Obtain mill certificates signed by manufacturers of steel sheet, or test reports from a qualified testing agency, indicating that steel sheet used in cold-formed metal panel framing complies with requirements including uncoated steel thickness, yield strength, tensile strength, total elongation, chemical requirements, and galvanized-coating thickness.
3. Mill Certificates: Obtain certified mill test reports from manufacturer of structural-steel shapes and hollow structural sections used in panel framing indicating compliance of these products with requirements.
4. Source Limitations: Obtain GFRC panels from single source from single manufacturer.
5. Welding Qualifications: Qualify procedures and personnel according to AWS D1.1/D1.1M, "Structural Welding Code - Steel," and AWS D1.3, "Structural Welding Code - Sheet Steel."
6. PCI Manuals: Comply with requirements and recommendations in the following PCI manuals unless more stringent requirements are indicated:
 - a. PCI MNL 128, "Recommended Practice for Glass Fiber Reinforced Concrete Panels."
 - b. PCI MNL 130, "Manual for Quality Control for Plants and Production of Glass Fiber Reinforced Concrete Products."
7. AISC Specifications: Comply with AISC's "Specification for Structural Steel Buildings - Allowable Stress Design and Plastic Design" **OR** "Load and Resistance Factor Design Specification for Structural Steel Buildings" **OR** "Specification for the Design of Steel Hollow Structural Sections," **as directed**, if using structural-steel shapes or hollow structural sections for panel frames.
8. Preinstallation Conference: Conduct conference at Project site.

G. Delivery, Storage, And Handling

1. Handle and transport GFRC panels to avoid damage.
 - a. Place nonstaining resilient spacers between panels.
 - b. Support panels on nonstaining material during shipment.
 - c. Protect panels from dirt and damage during handling and transport.
2. Store GFRC panels to protect from contact with soil, staining, and physical damage.
 - a. Store panels with nonstaining resilient supports in same positions as when transported.
 - b. Store panels on firm, level, and smooth surfaces.
 - c. Place stored panels so identification marks are clearly visible.

1.2 PRODUCTS

A. Mold Materials

1. Molds: Rigid, dimensionally stable, nonabsorptive material, warp and buckle free, that will provide continuous and true GFRC surfaces; nonreactive with GFRC and capable of producing required finish surfaces.
 - a. Mold-Release Agent: Commercially produced liquid-release agent that will not bond with, stain, or adversely affect GFRC surfaces and will not impair subsequent surface or joint treatments of GFRC.
2. Form Liners: Units of face design, texture, arrangement, and configuration indicated **OR** to match GFRC design reference sample, **as directed**. Provide solid backing and form supports to ensure that form liners remain in place during GFRC application. Use with manufacturer's recommended liquid-release agent that will not bond with, stain, or adversely affect GFRC surfaces and will not impair subsequent surface or joint treatments of GFRC.
3. Surface Retarder: Chemical liquid set retarder capable of temporarily delaying hardening of newly placed GFRC face mix to depth of reveal specified.

B. GFRC Materials

1. Portland Cement: ASTM C 150; Type I, II, or III.
 - a. For surfaces exposed to view in finished structure, use gray **OR** white, **as directed**, of same type, brand, and source throughout GFRC production.
 - b. Metakaolin: ASTM C 618, Class N.
2. Glass Fibers: Alkali resistant, with a minimum zirconia content of 16 percent, **1 to 2 inches (25 to 50 mm)** long, specifically produced for use in GFRC, and complying with PCI MNL 130.
3. Sand: Washed and dried silica, complying with composition requirements in ASTM C 144; passing **No. 20 (0.85-mm)** sieve with a maximum of 2 percent passing **No. 100 (0.15-mm)** sieve.
4. Facing Aggregate: ASTM C 33, except for gradation, and PCI MNL 130, **1/4-inch (6-mm)** maximum size.
 - a. Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining; to match sample.
5. Coloring Admixture: ASTM C 979, synthetic mineral-oxide pigments or colored water-reducing admixtures, temperature stable, nonfading, and alkali resistant.
6. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of GFRC and complying with chemical limits of PCI MNL 130.
7. Polymer-Curing Admixture: Acrylic thermoplastic copolymer dispersion complying with PCI MNL 130.
8. Air-Entraining Admixture: ASTM C 260, containing not more than 0.1 percent chloride ions.
9. Chemical Admixtures: ASTM C 494/C 494M, containing not more than 0.1 percent chloride ions.

C. Anchors, Connectors, And Miscellaneous Materials

1. Stainless-Steel Plates: ASTM A 240/A 240M or ASTM A 666, Type 304.
2. Carbon-Steel Shapes and Plates: ASTM A 36/A 36M. Finish steel shapes and plates less than **3/16 inch (4.76 mm)** thick as follows:
 - a. Finish: Zinc coated by hot-dip process according to ASTM A 123/A 123M, after fabrication, or ASTM A 153/A 153M, as applicable **OR** electrodeposition according to ASTM B 633, SC 3, **as directed**.
OR
Finish: Shop primed with MPI#79 **OR** SSPC-Paint 25, **as directed**, on surfaces prepared to comply with SSPC-SP 2, "Hand Tool Cleaning," or better.
3. Stainless-Steel Bars and Shapes: ASTM A 276, Type 304.
4. Carbon-Steel Bars: ASTM A 108, AISI Grade 1018. Finish steel bars less than **3/16 inch (4.76 mm)** thick as follows:
 - a. Finish: Zinc coated by hot-dip process according to ASTM A 123/A 123M, after fabrication, or ASTM A 153/A 153M, as applicable **OR** electrodeposition according to ASTM B 633, SC 3, **as directed**.

- b. Finish: Shop primed with MPI#79 **OR** SSPC-Paint 25, **as directed**, on surfaces prepared to comply with SSPC-SP 2, "Hand Tool Cleaning," or better.
5. Malleable-Iron Castings: ASTM A 47/ A 47M, **Grade 32510 (Grade 22010)**.
6. Carbon-Steel Castings: ASTM A 27/A 27M, **Grade 60-30 (Grade 415-205)**.
7. Bolts: **ASTM A 307 or ASTM A 325 (ASTM F 568M or ASTM A 325M)**.
 - a. Finish: Zinc coated by hot-dip process according to ASTM A 123/A 123M, after fabrication, and ASTM A 153/A 153M, as applicable **OR** electrodeposition according to ASTM B 633, SC 3, **as directed**.
8. Reglets: PVC extrusions **OR** Stainless steel, ASTM A 240/A 240M, Type 304, **0.016 inch (0.40 mm)** thick, **as directed**.

D. Panel Frame Materials

1. Cold-Formed Steel Framing: Manufacturer's standard C-shaped steel studs, complying with AISI's "North American Specification for the Design of Cold-Formed Steel Structural Members," minimum uncoated steel thickness of **0.053 inch (1.34 mm)** of web depth indicated, with stiffened flanges, U-shaped steel track, and of the following steel sheet:
 - a. Metallic-Coated Steel Sheet: ASTM A 653/A 653M, structural-steel sheet, **G60 (Z180) OR G90 (Z275)**, **as directed**, zinc coating, of grade required by structural performance of framing.
 - b. Painted, Nonmetallic-Coated Steel Sheet: ASTM A 1011/A 1011M, hot rolled; or ASTM A 1008/A 1008M, cold rolled; nonmetallic coated according to ASTM A 1003/A 1003M; of grade required by structural performance of framing.
2. Hollow Structural Sections: Steel tubing, ASTM A 500, Grade B, or ASTM A 513. Finish hollow structural sections with wall thickness less than **3/16 inch (4.76 mm)** as follows:
 - a. Organic Zinc-Rich Primer: SSPC-Paint 20 on surfaces prepared to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - b. Primer: MPI#79 **OR** SSPC-Paint 25, **as directed**, on surfaces prepared to comply with SSPC-SP 2, "Hand Tool Cleaning," or better.
3. Steel Channels and Angles: ASTM A 36/A 36M, finished as follows:
 - a. Organic Zinc-Rich Primer: SSPC-Paint 20 on surfaces prepared to comply with SSPC-SP 6/NACE No. 3, "Commercial Blast Cleaning."
 - b. Primer: MPI#79 **OR** SSPC-Paint 25, **as directed**, on surfaces prepared to comply with SSPC-SP 2, "Hand Tool Cleaning," or better.

E. GFRC Mixes

1. Backing Mix: Proportion backing mix of portland cement, glass fibers, sand, and admixtures to comply with design requirements. Provide nominal glass-fiber content of not less than 5 percent by weight of total mix.
2. Face Mix: Proportion face mix of portland cement, sand, facing aggregates, and admixtures to comply with design requirements.
3. Mist Coat: Portland cement, sand slurry, and admixtures; of same proportions as backing mix without glass fibers.
4. Polymer-Curing Admixture: 6 to 7 percent by weight of polymer-curing admixture solids to dry portland cement.
5. Air Content: 8 to 10 percent; ASTM C 185.
6. Coloring Admixture: Not to exceed 10 percent of cement weight.

F. Panel Frame Fabrication

1. Fabricate panel frames and accessories plumb, square, true to line, and with components securely fastened, according to Shop Drawings and requirements in this Section.
 - a. Fabricate panel frames using jigs or templates.
 - b. Cut cold-formed metal framing members by sawing or shearing; do not torch cut.
 - c. Fasten cold-formed metal framing members by welding. Comply with AWS D1.3 requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.

- d. Fasten framing members of hollow structural sections, steel channels, or steel angles by welding. Comply with AWS D1.1/D1.1M requirements and procedures for welding, appearance and quality of welds, and methods used in correcting welding work.
 - e. Weld flex, gravity, and seismic anchors to panel frames.
 2. Reinforce, stiffen, and brace framing assemblies, if necessary, to withstand handling, delivery, and erection stresses. Lift fabricated assemblies in a manner that prevents damage or significant distortion.
 3. Galvanizing Repair: Touch up accessible damaged galvanized surfaces according to ASTM A 780.
 4. Painting Repair: Touch up accessible damaged painted surfaces using same primer.
- G. Mold Fabrication
1. Construct molds that will result in finished GFRC complying with profiles, dimensions, and tolerances indicated, without damaging GFRC during stripping. Construct molds to prevent water leakage and loss of cement paste.
 - a. Coat contact surfaces of molds with form-release agent.
 - b. Coat contact surfaces of molds with surface retarder.
 2. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and supports to maintain stability of liners during GFRC application. Coat form liner with form-release agent.
 3. Locate, place, and secure flashing reglets accurately.
- H. GFRC Fabrication
1. Proportioning and Mixing: For backing mix, meter sand/cement slurry and glass fibers to spray head at rates to achieve design mix proportions and glass-fiber content according to PCI MNL 130 procedures.
 2. Spray Application: Comply with general procedures as follows:
 - a. Spray mist coat over molds to a nominal thickness of **1/8 inch (3 mm)** on planar surfaces.
 - b. Spray or place face mix in thickness indicated on Shop Drawings.
 - c. Proceed with spraying backing mix before face mix **OR** mist coat, **as directed**, has set, using procedures that produce a uniform thickness and even distribution of glass fibers and matrix.
 - d. Consolidate backing mix by rolling or other technique to achieve complete encapsulation of glass fibers and compaction.
 - e. Measure thickness with a pin gage or other acceptable method at least once for each **5 sq. ft. (0.5 sq. m)** of panel surface. Take not less than six measurements per panel.
 3. Hand form and consolidate intricate details, incorporate formers or infill materials, and over spray before material reaches initial set to ensure complete bonding.
 4. Attach panel frame to GFRC before initial set of GFRC backing, maintaining a minimum clearance of **1/2 inch (13 mm)** from GFRC backing, and without anchors protruding into GFRC backing.
 5. Build up homogeneous GFRC bonding pads over anchor feet, maintaining a minimum thickness of **1/2 inch (13 mm)** over tops of anchor feet, before initial set of GFRC backing.
 6. Inserts and Embedments: Build up homogeneous GFRC bosses or bonding pads over inserts and embedments to provide sufficient anchorage and embedment to comply with design requirements.
 7. Curing: Employ initial curing method that will ensure sufficient strength for removing units from mold. Comply with PCI MNL 130 procedures.
 8. Panel Identification: Mark each GFRC panel to correspond with identification mark on Shop Drawings. Mark each panel with its casting date.
- I. Fabrication Tolerances
1. Manufacturing Tolerances: Manufacture GFRC panels so each finished unit complies with PCI MNL 130 for dimension, position, and tolerances.
OR

Manufacturing Tolerances: Manufacture GFRC panels so each finished unit complies with the following dimensional tolerances. For dimensional tolerances not listed below, comply with PCI MNL 130.

- a. Overall Height and Width of Units, Measured at the Face Adjacent to Mold: As follows:
 - 1) 10 feet (3 m) or less, plus or minus 1/8 inch (3 mm).
 - 2) More than 10 feet (3 m), plus or minus 1/8 inch per 10 feet (3 mm per 3 m); 1/4 inch (6 mm) maximum.
 - b. Edge Return Thickness: Plus 1/2 inch (13 mm), minus 0 inch (0 mm).
 - c. Architectural Facing Thickness: Plus 1/8 inch (3 mm), minus 0 inch (0 mm).
 - d. Backing Thickness: Plus 1/4 inch (6 mm), minus 0 inch (0 mm).
 - e. Panel Depth from Face of Skin to Back of Panel Frame or Integral Rib: Plus 3/8 inch (10 mm), minus 1/4 inch (6 mm).
 - f. Angular Variation of Plane of Side Mold: Plus or minus 1/32 inch per 3 inches (0.8 mm per 75 mm) of depth or plus or minus 1/16 inch (1.5 mm) total, whichever is greater.
 - g. Variation from Square or Designated Skew (Difference in Length of Two Diagonal Measurements): Plus or minus 1/8 inch per 72 inches (3 mm per 1800 mm) or plus or minus 1/4 inch (6 mm) total, whichever is greater.
 - h. Local Smoothness: 1/4 inch per 10 feet (6 mm per 3 m).
 - i. Bowing: Not to exceed L/240 unless unit meets erection tolerances using connection adjustments.
 - j. Length and Width of Block Outs and Openings within One Unit: Plus or minus 1/4 inch (6 mm).
 - k. Location of Window Opening within Panel: Plus or minus 1/4 inch (6 mm).
 - l. Maximum Permissible Warpage of One Corner out of the Plane of the Other Three: 1/16 inch per 12 inches (1.5 mm per 305 mm) of distance from nearest adjacent corner.
2. Position Tolerances: Measured from datum line locations, as indicated on Shop Drawings.
 - a. Panel Frame and Track: Plus or minus 1/4 inch (6 mm).
 - b. Flashing Reglets at Edge of Panel: Plus or minus 1/4 inch (6 mm).
 - c. Inserts: Plus or minus 1/2 inch (13 mm).
 - d. Special Handling Devices: Plus or minus 3 inches (75 mm).
 - e. Location of Bearing Devices: Plus or minus 1/4 inch (6 mm).
 - f. Blockouts: Plus or minus 3/8 inch (10 mm).
 3. Panel Frame Tolerances: As follows:
 - a. Vertical and Horizontal Alignment: 1/4 inch per 10 feet (6 mm per 3 m).
 - b. Spacing of Framing Member: Plus or minus 3/8 inch (10 mm).
 - c. Squareness of Frame: Difference in length of diagonals of 3/8 inch (10 mm).
 - d. Overall Size of Frame: Plus or minus 3/8 inch (10 mm).

J. Finishes

1. Finish exposed-face surfaces of GFRC as follows to match approved design reference sample. Panel faces shall be free of joint marks, grain, or other obvious defects.
 - a. Design Reference Sample: <Insert description and identify manufacturer and code number of sample>.
 - b. As-Cast-Surface Finish: Provide free of sand streaks, honeycombs, and excessive air voids, with uniform color and texture.
 - c. Textured-Surface Finish: Impart by form liners to provide surfaces free of sand streaks, honeycombs, and excessive air voids, with uniform color and texture.
 - d. Retarded Finish: Use chemical-retarding agents applied to concrete forms and washing and brushing procedures to expose aggregate and surrounding matrix surfaces after form removal.
 - e. Sand- or Abrasive-Blast Finish: Use abrasive grit, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.
 - f. Acid-Etched Finish: Use acid and hot-water solution equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.

K. Source Quality Control

1. Quality-Control Testing: Establish and maintain a quality-control program for manufacturing GFRC panels according to PCI MNL 130.
 - a. Test materials and inspect production techniques.
 - b. Quality-control program shall monitor glass-fiber content, spray rate, unit weight, product physical properties, anchor pull-off and shear strength, and curing period and conditions.
 - c. Prepare test specimens and test according to ASTM C 1228, PCI MNL 130, and PCI MNL 128 procedures.
 - d. Test GFRC inserts and anchors according to ASTM C 1230 to validate design values.
 - e. Produce test boards at a rate not less than one per work shift per operator for each spray machine and for each mix design.
 - 1) For each test board, determine glass-fiber content according to ASTM C 1229, and flexural yield and ultimate strength according to ASTM C 947.

1.3 EXECUTION

A. Examination

1. Examine structure and conditions for compliance with requirements for installation tolerances, true and level bearing surfaces, and other conditions affecting performance of the Work.
2. Proceed with installation only after unsatisfactory conditions have been corrected.

B. Erection

1. Install clips, hangers, and other accessories required for connecting GFRC panels to supporting members and backup materials.
2. Lift GFRC panels and install without damage.
3. Install GFRC panels level, plumb, square, and in alignment. Provide temporary supports and bracing as required to maintain position, stability, and alignment of panels until permanent connections are completed.
 - a. Maintain horizontal and vertical joint alignment and uniform joint width.
 - b. Remove projecting hoisting devices.
4. Connect GFRC panels in position by bolting or welding, or both, as indicated on Shop Drawings. Remove temporary shims, wedges, and spacers as soon as possible after connecting is completed.
5. Welding: Comply with applicable AWS D1.1/D1.1M and AWS D1.3 requirements for welding, appearance, quality of welds, and methods used in correcting welding work.
 - a. Protect GFRC panels from damage by field welding or cutting operations, and provide noncombustible shields as required.
6. At bolted connections, use lock washers or other acceptable means to prevent loosening of nuts.

C. Erection Tolerances

1. Erect GFRC panels to comply with the following noncumulative tolerances:
 - a. Plan Location from Building Grid Datum: Plus or minus **1/2 inch (13 mm)**.
 - b. Top Elevation from Nominal Top Elevation: As follows:
 - 1) Exposed Individual Panel: Plus or minus **1/4 inch (6 mm)**.
 - 2) Nonexposed Individual Panel: Plus or minus **1/2 inch (13 mm)**.
 - 3) Exposed Panel Relative to Adjacent Panel: **1/4 inch (6 mm)**.
 - 4) Nonexposed Panel Relative to Adjacent Panel: **1/2 inch (13 mm)**.
 - c. Support Elevation from Nominal Elevation: As follows:
 - 1) Maximum Low: **1/2 inch (13 mm)**.
 - 2) Maximum High: **1/4 inch (6 mm)**.
 - d. Maximum Plumb Variation over the Lesser of Height of Structure or **100 Feet (30 m)**: **1 inch (25 mm)**.
 - e. Plumb in Any **10 Feet (3 m)** of Element Height: **1/4 inch (6 mm)**.
 - f. Maximum Jog in Alignment of Matching Edges: **1/4 inch (6 mm)**.
 - g. Maximum Jog in Alignment of Matching Faces: **1/4 inch (6 mm)**.

03 - Concrete

- h. Face Width of Joint: As follows (governs over joint taper):
 - 1) Panel Dimension **20 Feet (6 m)** or Less: Plus or minus **1/4 inch (6 mm)**.
 - 2) Panel Dimension More Than **20 Feet (6 m)**: Plus or minus **5/16 inch (8 mm)**.
- i. Maximum Joint Taper: **3/8 inch (10 mm)**.
- j. Joint Taper in **10 Feet (3 m)**: **1/4 inch (6 mm)**.
- k. Differential Bowing, as Erected, between Adjacent Members of Same Design: **1/4 inch (6 mm)**.

D. Repairs

1. Repairs will be permitted provided structural adequacy of GFRC panel and appearance are not impaired, as approved by the Owner.
2. Mix patching materials and repair GFRC so cured patches blend with color, texture, and uniformity of adjacent exposed surfaces.
3. Prepare and repair accessible damaged galvanized coatings with galvanizing repair paint according to ASTM A 780.
4. Wire brush, clean, and paint accessible weld areas on prime-painted components with same type of shop primer.
5. Remove and replace damaged GFRC panels when repairs do not comply with requirements.

E. Cleaning And Protection

1. Perform cleaning procedures, if necessary, according to GFRC manufacturer's written instructions. Clean soiled GFRC surfaces with detergent and water, using soft fiber brushes and sponges, and rinse with clean water. Prevent damage to GFRC surfaces and staining of adjacent materials.

SECTION 03 41 16 00 - PRECAST STRUCTURAL CONCRETE

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for plant-precast structural concrete. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. Section Includes:
 - a. Precast structural concrete.
 - b. Precast structural concrete with thin-brick or stone facings.
 - c. Precast structural concrete with commercial architectural finish.

C. Definition

1. Design Reference Sample: Sample of approved precast structural concrete color, finish, and texture, preapproved by the Owner.

D. Performance Requirements

1. Delegated Design: Design precast structural concrete, including comprehensive engineering analysis by a qualified professional engineer, using performance requirements and design criteria indicated.
2. Structural Performance: Precast structural concrete units and connections shall withstand design loads indicated within limits and under conditions indicated.
 - a. Fire-Resistance Rating: Select material and minimum thicknesses to provide indicated fire rating.

E. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittals:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - 1) Include statement indicating costs for each product having recycled content.
 - b. Design Mixtures for Credit ID 1.1: For each concrete mixture containing fly ash as a replacement for portland cement or other portland cement replacements and for equivalent concrete mixtures that do not contain portland cement replacements.
3. Design Mixtures: For each precast concrete mixture. Include compressive strength and water-absorption tests.
4. Shop Drawings: Include member locations, plans, elevations, dimensions, shapes and sections, openings, support conditions, and types of reinforcement, including special reinforcement. Detail fabrication and installation of precast structural concrete units.
5. Delegated-Design Submittal: For precast structural concrete indicated to comply with performance requirements and design criteria, including analysis data signed and sealed by the qualified professional engineer responsible for their preparation.
6. Qualification Data: For Installer **OR** fabricator **OR** testing agency, **as directed**.
7. Welding certificates.
8. Material Certificates.
9. Material Test Reports.
10. Source quality-control reports.
11. Field quality-control and special inspection, **as directed**, reports.

F. Quality Assurance

1. Fabricator Qualifications: A firm that assumes responsibility for engineering precast structural concrete units to comply with performance requirements. Responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.
 - a. Participates in PCI's Plant Certification program and is designated a PCI-certified plant as follows:
 - 1) Group C, Category C1 - Precast Concrete Products (no prestressed reinforcement) **OR** Category C2 - Prestressed Hollowcore and Repetitively Produced Products **OR** Category C3 - Prestressed Straight Strand Structural Members **OR** Category C4 - Prestressed Deflected Strand Structural Members, **as directed**.
 - 2) Group CA, Category C1A - Precast Concrete Products (no prestressed reinforcement) **OR** Category C2A - Prestressed Hollowcore and Repetitively Produced Products **OR** Category C3A - Prestressed Straight-Strand Structural Members **OR** Category C4A - Prestressed Deflected-Strand Structural Members, **as directed**.
2. Design Standards: Comply with **ACI 318 (ACI 318M)** and design recommendations in PCI MNL 120, "PCI Design Handbook - Precast and Prestressed Concrete," applicable to types of precast structural concrete units indicated.
3. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and dimensional tolerances for types of units required, comply with PCI MNL 116, "Manual for Quality Control for Plants and Production of Structural Precast Concrete Products."
4. Welding Qualifications: Qualify procedures and personnel according to the following:
 - a. AWS D1.1/D.1.1M, "Structural Welding Code - Steel."
 - b. AWS D1.4, "Structural Welding Code - Reinforcing Steel."
5. Fire-Resistance Calculations: Where indicated, provide precast structural concrete units whose fire resistance meets the prescriptive requirements of authorities having jurisdiction or has been calculated according to ACI 216.1/TMS 0216.1, "Standard Method for Determining Fire Resistance of Concrete and Masonry Construction Assemblies," **OR** PCI MNL 124, "Design for Fire Resistance of Precast Prestressed Concrete," **as directed**, and is acceptable to authorities having jurisdiction.
6. Preinstallation Conference: Conduct conference at Project site.

G. Delivery, Storage, And Handling

1. Support units during shipment on nonstaining shock-absorbing material in same position as during storage.
2. Store units with adequate bracing and protect units to prevent contact with soil, to prevent staining, and to prevent cracking, distortion, warping or other physical damage.
 - a. Store units with dunnage across full width of each bearing point unless otherwise indicated.
 - b. Place adequate dunnage of even thickness between each unit.
 - c. Place stored units so identification marks are clearly visible, and units can be inspected.
3. Handle and transport units in a position consistent with their shape and design in order to avoid excessive stresses that would cause cracking or damage.
4. Lift and support units only at designated points shown on Shop Drawings.

H. Coordination

1. Furnish loose connection hardware and anchorage items to be embedded in or attached to other construction before starting that Work. Provide locations, setting diagrams, templates, instructions, and directions, as required, for installation.

1.2 PRODUCTS

A. Mold Materials

1. Molds: Rigid, dimensionally stable, non-absorptive material, warp and buckle free, that will provide continuous and true precast concrete surfaces within fabrication tolerances indicated; nonreactive with concrete and suitable for producing required finishes.
 - a. Mold-Release Agent: Commercially produced liquid-release agent that will not bond with, stain or adversely affect precast concrete surfaces and will not impair subsequent surface or joint treatments of precast concrete.
 2. Form Liners: Units of face design, texture, arrangement, and configuration indicated **OR** to match those used for precast concrete design reference sample, **as directed**. Furnish with manufacturer's recommended liquid-release agent that will not bond with, stain, or adversely affect precast concrete surfaces and will not impair subsequent surface or joint treatments of precast concrete.
 3. Surface Retarder: Chemical set retarder, capable of temporarily delaying final hardening of newly placed concrete mixture to depth of reveal specified.
- B. Reinforcing Materials
1. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than 25 **OR** 60, **as directed**, percent.
 2. Reinforcing Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420)**, deformed.
 3. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M, deformed.
 4. Galvanized Reinforcing Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420)** **OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 767/A 767M, Class II zinc coated, hot-dip galvanized, and chromate wash treated after fabrication and bending, **as directed**.
 5. Epoxy-Coated Reinforcing Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420)** **OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 775/A 775M **OR** ASTM A 934/A 934M, **as directed**, epoxy coated, with less than 2 percent damaged coating in each **12-inch (300-mm)** bar length.
 6. Steel Bar Mats: ASTM A 184/A 184M, fabricated from ASTM A 615/A 615M, **Grade 60 (Grade 420)** **OR** ASTM A 706/A 706M, **as directed**, deformed bars, assembled with clips.
 7. Plain-Steel Welded Wire Reinforcement: ASTM A 1064, fabricated from as-drawn steel **OR** galvanized-steel, **as directed**, wire into flat sheets.
 8. Deformed-Steel Welded Wire Reinforcement: ASTM A 497/A 497M, flat sheet.
 9. Epoxy-Coated-Steel Wire: ASTM A 884/A 884M, Class A coated, plain **OR** deformed, **as directed**, flat sheet, Type 1 bendable **OR** Type 2 nonbendable, **as directed**, coating.
 10. Supports: Suspend reinforcement from back of mold or use bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire reinforcement in place according to PCI MNL 116.
- C. Prestressing Tendons
1. Pretensioning Strand: ASTM A 416/A 416M, **Grade 250 (Grade 1720)** or **Grade 270 (Grade 1860)**, uncoated, 7-wire **OR** ASTM A 886/A 886M, **Grade 270 (Grade 1860)**, indented, 7-wire, **as directed**, low-relaxation strand.
 2. Unbonded Post-Tensioning Strand: ASTM A 416/A 416M, **Grade 270 (Grade 1860)**, uncoated, 7-wire, low-relaxation strand.
 - a. Coat unbonded post-tensioning strand with post-tensioning coating complying with ACI 423.6 and sheath with polypropylene tendon sheathing complying with ACI 423.6. Include anchorage devices and coupler assemblies.
 3. Post-Tensioning Bars: ASTM A 722, uncoated high-strength steel bar.
- D. Concrete Materials
1. Portland Cement: ASTM C 150, Type I or Type III, gray, unless otherwise indicated.
 - a. For surfaces exposed to view in finished structure, mix gray with white cement, of same type, brand, and mill source.
 2. Supplementary Cementitious Materials:
 - a. Fly Ash: ASTM C 618, Class C or F, with maximum loss on ignition of 3 percent.
 - b. Metakaolin Admixture: ASTM C 618, Class N.

- c. Silica Fume Admixture: ASTM C 1240, with optional chemical and physical requirement.
 - d. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
 - 3. Normal-Weight Aggregates: Except as modified by PCI MNL 116, ASTM C 33, with coarse aggregates complying with Class 5S **OR** Class 5M **OR** Class 4S **OR** Class 4M, **as directed**. Stockpile fine and coarse aggregates for each type of exposed finish from a single source (pit or quarry) for Project.
 - a. Face-Mixture-Coarse Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining; to match selected finish sample.
 - 1) Gradation: Uniformly graded **OR** Gap graded **OR** To match design reference sample, **as directed**.
 - b. Face-Mixture-Fine Aggregates: Selected, natural or manufactured sand of same material as coarse aggregate unless otherwise approved by the Owner.
 - 4. Lightweight Aggregates: Except as modified by PCI MNL 116, ASTM C 330, with absorption less than 11 percent.
 - 5. Coloring Admixture: ASTM C 979, synthetic or natural mineral-oxide pigments or colored water-reducing admixtures, temperature stable, and nonfading.
 - 6. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 116.
 - 7. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.
 - 8. Chemical Admixtures: Certified by manufacturer to be compatible with other admixtures and to not contain calcium chloride, or more than 0.15 percent chloride ions or other salts by weight of admixture.
 - a. Water-Reducing Admixtures: ASTM C 494/C 494M, Type A.
 - b. Retarding Admixture: ASTM C 494/C 494M, Type B.
 - c. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.
 - d. Water-Reducing and Accelerating Admixture: ASTM C 494/C 494M, Type E.
 - e. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
 - f. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
 - g. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017M.
 - 9. Corrosion-Inhibiting Admixture: Commercially formulated, anodic inhibitor or mixed cathodic and anodic inhibitor; capable of forming a protective barrier and minimizing chloride reactions with steel reinforcement in concrete.
- E. Steel Connection Materials
- 1. Carbon-Steel Shapes and Plates: ASTM A 36/A 36M.
 - 2. Carbon-Steel-Headed Studs: ASTM A 108, AISI 1018 through AISI 1020, cold finished, AWS D1.1/D1.1M, Type A or B, with arc shields and with minimum mechanical properties of PCI MNL 116.
 - 3. Carbon-Steel Plate: ASTM A 283/A 283M.
 - 4. Malleable-Iron Castings: ASTM A 47/A 47M.
 - 5. Carbon-Steel Castings: ASTM A 27/A 27M, **Grade 60-30 (Grade 415-205)**.
 - 6. High-Strength, Low-Alloy Structural Steel: ASTM A 572/A 572M.
 - 7. Carbon-Steel Structural Tubing: ASTM A 500, Grade B.
 - 8. Wrought Carbon-Steel Bars: ASTM A 675/A 675M, **Grade 65 (Grade 450)**.
 - 9. Deformed-Steel Wire or Bar Anchors: ASTM A 496 or ASTM A 706/A 706M.
 - 10. Carbon-Steel Bolts and Studs: **ASTM A 307, Grade A (ASTM F 568M, Property Class 4.6)**; carbon-steel, hex-head bolts and studs; carbon-steel nuts, **ASTM A 563 (ASTM A 563M)**; and flat, unhardened steel washers, ASTM F 844.
 - 11. High-Strength Bolts and Nuts: **ASTM A 325 (ASTM A 325M)** or **ASTM A 490 (ASTM A 490M)**, Type 1, heavy hex steel structural bolts; heavy hex carbon-steel nuts, **ASTM A 563 (ASTM A 563M)**; and hardened carbon-steel washers, **ASTM F 436 (ASTM F 436M)**.
 - a. Do not zinc coat **ASTM A 490 (ASTM A 490M)** bolts.
 - 12. Zinc-Coated Finish: For exterior steel items, steel in exterior walls, **as directed**, and items indicated for galvanizing, apply zinc coating by hot-dip process according to ASTM A 123/A 123M

- or ASTM A 153/A 153M **OR** electrodeposition according to ASTM B 633, SC 3, Types 1 and 2, **as directed**.
- a. For steel shapes, plates, and tubing to be galvanized, limit silicon content of steel to less than 0.03 percent or to between 0.15 and 0.25 percent or limit sum of silicon and 2.5 times phosphorous content to 0.09 percent.
 - b. Galvanizing Repair Paint: High-zinc-dust-content paint with dry film containing not less than 94 percent zinc dust by weight, and complying with DOD-P-21035B or SSPC-Paint 20.
13. Shop-Primed Finish: Prepare surfaces of nongalvanized-steel items, except those surfaces to be embedded in concrete, according to requirements in SSPC-SP 3, and shop apply lead- and chromate-free, rust-inhibitive primer, complying with performance requirements in MPI 79 **OR** SSPC-Paint 25, **as directed**, according to SSPC-PA 1.
 14. Welding Electrodes: Comply with AWS standards.
 15. Precast Accessories: Provide clips, hangers, plastic or steel shims, and other accessories required to install precast structural concrete units.
- F. Stainless-Steel Connection Materials
1. Stainless-Steel Plate: ASTM A 666, Type 304, of grade suitable for application.
 2. Stainless-Steel Bolts and Studs: ASTM F 593, Alloy 304 or 316, hex-head bolts and studs; stainless-steel nuts; and flat, stainless-steel washers. Lubricate threaded parts of stainless-steel bolts with an antiseize thread lubricant during assembly.
 3. Stainless-Steel-Headed Studs: ASTM A 276, with minimum mechanical properties of PCI MNL 116.
- G. Bearing Pads
1. Provide one of the following bearing pads for precast structural concrete units as recommended by precast fabricator for application, **as directed**:
 - a. Elastomeric Pads: AASHTO M 251, plain, vulcanized, 100 percent polychloroprene (neoprene) elastomer, molded to size or cut from a molded sheet, 50 to 70 Shore, Type A durometer hardness, ASTM D 2240; minimum tensile strength **2250 psi (15.5 MPa)**, ASTM D 412.
 - b. Random-Oriented, Fiber-Reinforced Elastomeric Pads: Preformed, randomly oriented synthetic fibers set in elastomer. 70 to 90 Shore, Type A durometer hardness, ASTM D 2240; capable of supporting a compressive stress of **3000 psi (20.7 MPa)** with no cracking, splitting, or delaminating in the internal portions of pad. Test 1 specimen for every 200 pads used in Project.
 - c. Cotton-Duck-Fabric-Reinforced Elastomeric Pads: Preformed, horizontally layered cotton-duck fabric bonded to an elastomer; 80 to 100 Shore, Type A durometer hardness, ASTM D 2240; complying with AASHTO's "AASHTO Load and Resistance Factor Design (LRFD) Bridge Specifications," Division II, Section 18.10.2; or with MIL-C-882E.
 - d. Frictionless Pads: Tetrafluoroethylene, glass-fiber reinforced, bonded to stainless- or mild-steel plate, of type required for in-service stress.
 - e. High-Density Plastic: Multimonomer, nonleaching, plastic strip.
- H. Grout Materials
1. Sand-Cement Grout: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144 or ASTM C 404. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.
 2. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C 1107, Grade A for drypack and Grades B and C for flowable grout and of consistency suitable for application within a 30-minute working time.
 3. Epoxy-Resin Grout: Two-component, mineral-filled epoxy resin; ASTM C 881/C 881M, of type, grade, and class to suit requirements.
- I. Thin-Brick Units And Accessories

1. Thin-Brick Units: ASTM C 216, Type FBX or ASTM C 1088, Grade Exterior, Type TBX, not less than **1/2 inch (13 mm) OR 3/4 inch (19 mm) OR 1 inch (25 mm)**, as directed, thick with a tolerance of plus or minus **1/16 inch (1.6 mm)**, and as follows:
 - a. Face Color and Texture: Match the Owner's samples **OR** Medium brown, wire cut **OR** Full-range red, sand molded **OR** Gray, velour, as directed.
 - b. Face Size:
 - 1) **2-1/4 inches (57 mm)** high by **8 inches (203 mm)** long.
 - 2) **2-1/4 inches (57 mm)** high by **7-1/2 to 7-5/8 inches (190 to 194 mm)** long.
 - 3) **2-3/4 to 2-13/16 inches (70 to 71 mm)** high by **7-1/2 to 7-5/8 inches (190 to 194 mm)** long.
 - 4) **3-1/2 to 3-5/8 inches (89 to 92 mm)** high by **7-1/2 to 7-5/8 inches (190 to 194 mm)** long.
 - 5) **3-1/2 to 3-5/8 inches (89 to 92 mm)** high by **11-1/2 to 11-5/8 inches (292 to 295 mm)** long.
 - c. Where indicated to "match existing," provide thin brick matching color, texture, and face size of existing adjacent brick work.
 - d. Face Size:
 - 1) 57 mm high by 190 mm long.
 - 2) 70 mm high by 190 mm long.
 - 3) 90 mm high by 190 mm long.
 - 4) 90 mm high by 290 mm long.
 - e. Special Shapes: Include corners, edge corners, and end edge corners.
 - f. Initial Rate of Absorption: Less than **30 g/30 sq. in. (30 g/194 sq. cm)** per minute; ASTM C 67.
 - g. Efflorescence: Tested according to ASTM C 67 and rated "not effloresced."
 - h. Surface Coating: Thin brick with colors or textures applied as coatings shall withstand 50 cycles of freezing and thawing; ASTM C 67 with no observable difference in applied finish when viewed from **10 feet (3 m)**.
 - i. Back Surface Texture: Scored, combed, wire roughened, ribbed, keybacked, or dovetailed.
 2. Sand-Cement Mortar: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 4 parts sand, by volume, with minimum water required for placement.
 3. Latex-Portland Cement Pointing Grout: ANSI A118.6 and as follows:
 - a. Dry-grout mixture, factory prepared, of portland cement, graded aggregate, and dry, redispersible, ethylene-vinyl-acetate additive for mixing with water; uniformly colored.
 - b. Commercial portland cement grout, factory prepared, with liquid styrene-butadiene rubber or acrylic-resin latex additive; uniformly colored.
 - c. Colors: As indicated by manufacturer's designations **OR** Match the Owner's samples **OR** As selected by the Owner from manufacturer's full range, as directed.
- J. Stone Materials And Accessories
1. Stone facing for precast structural concrete is specified in Division 04 Section "Exterior Stone Cladding".
 2. Anchors: Stainless steel, ASTM A 666, Type 304, of temper and diameter required to support loads without exceeding allowable design stresses.
 - a. Fit each anchor leg with neoprene grommet collar of width at least twice the diameter and of length at least five times the diameter of anchor.
 3. Sealant Filler: ASTM C 920, low-modulus, multicomponent, nonsag urethane sealant complying with requirements in Division 07 Section "Joint Sealants" and that is nonstaining to stone substrate.
 4. Epoxy Filler: ASTM C 881/C 881M, 100 percent solids, sand-filled nonshrinking, nonstaining of type, class, and grade to suit application.
 - a. Elastomeric Anchor Sleeve: **1/2 inch (13 mm)** long; 60 Shore, Type A durometer hardness; ASTM D 2240.

5. Bond Breaker: Preformed, compressible, resilient, nonstaining, nonwaxing, closed-cell polyethylene foam pad, nonabsorbent to liquid and gas, **1/8 inch (3.2 mm)** thick **OR** Polyethylene sheet, ASTM D 4397, **6 to 10 mils (0.15 to 0.25 mm)** thick, **as directed**.
- K. Insulated Flat Wall Panel Accessories
1. Molded-Polystyrene Board Insulation: ASTM C 578, Type I, **0.90 lb/cu. ft. (15 kg/cu. m)** **OR** Type VIII, **1.15 lb/cu. ft. (18 kg/cu. m)** **OR** Type II, **1.35 lb/cu. ft. (22 kg/cu. m)**, **as directed**; square **OR** ship-lap, **as directed**, edges; with R-value and thickness as directed by the Owner.
 2. Extruded-Polystyrene Board Insulation: ASTM C 578, Type IV, **1.60 lb/cu. ft. (26 kg/cu. m)** **OR** Type X, **1.30 lb/cu. ft. (21 kg/cu. m)** **OR** Type VI, **1.80 lb/cu. ft. (29 kg/cu. m)**, **as directed**; square **OR** ship-lap, **as directed**, edges; with R-value and thickness as directed by the Owner.
 3. Polyisocyanurate Board Insulation: ASTM C 591, Type I, **1.8 lb/cu. ft. (29 kg/cu. m)** **OR** Type IV, **2 lb/cu. ft. (32 kg/cu. m)** **OR** Type II, **2.5 lb/cu. ft. (40 kg/cu. m)**, **as directed**, unfaced, with R-value and thickness as directed by the Owner.
 4. Wythe Connectors: Glass-fiber connectors **OR** Vinyl-ester polymer connectors **OR** Polypropylene pin connectors **OR** Stainless-steel pin connectors **OR** Bent galvanized reinforcing bars **OR** Galvanized welded wire trusses **OR** Galvanized bent wire connectors **OR** Cylindrical metal sleeve anchors, **as directed**, manufactured to connect wythes of precast concrete panels.
- L. Concrete Mixtures
1. Prepare design mixtures for each type of precast concrete required.
 - a. Use fly ash, pozzolan, ground granulated blast-furnace slag, and silica fume as needed to reduce the total amount of portland cement, which would otherwise be used, by not less than 40 percent.
 - b. Limit use of fly ash to 25 percent replacement of portland cement by weight and granulated blast-furnace slag to 40 percent of portland cement by weight; metakaolin and silica fume to 10 percent of portland cement by weight.
 2. Design mixtures may be prepared by a qualified independent testing agency or by qualified precast plant personnel at precast structural concrete fabricator's option.
 3. Limit water-soluble chloride ions to maximum percentage by weight of cement permitted by **ACI 318 (ACI 318M)** or PCI MNL 116 when tested according to ASTM C 1218/C 1218M.
 4. Normal-Weight Concrete Mixtures: Proportion face mixtures **OR** face and backup mixtures **OR** full-depth mixture, **as directed**, by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:
 - a. Compressive Strength (28 Days): **5000 psi (34.5 MPa)**.
 - b. Maximum Water-Cementitious Materials Ratio: 0.45.
 5. Water Absorption: 6 percent by weight or 14 percent by volume, tested according to PCI MNL 116.
 6. Lightweight Concrete Backup Mixtures: Proportion mixtures by either laboratory trial batch or field test data methods according to ACI 211.2, with materials to be used on Project, to provide lightweight concrete with the following properties:
 - a. Compressive Strength (28 Days): **5000 psi (34.5 MPa)**.
 - b. Unit Weight: Calculated equilibrium unit weight of **115 lb/cu. ft. (1842 kg/cu. m)**, plus or minus **3 lb/cu. ft. (48 kg/cu. m)**, according to ASTM C 567.
 7. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 116.
 8. When included in design mixtures, add other admixtures to concrete mixtures according to manufacturer's written instructions.
 9. Concrete Mix Adjustments: Concrete mix design adjustments may be proposed if characteristics of materials, Project conditions, weather, test results, or other circumstances warrant.
- M. Mold Fabrication
1. Molds: Accurately construct molds, mortar tight, of sufficient strength to withstand pressures due to concrete-placement operations and temperature changes and for prestressing and

denstioning operations. Coat contact surfaces of molds with release agent before reinforcement is placed. Avoid contamination of reinforcement and prestressing tendons by release agent.

- a. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and supports to maintain stability of liners during concrete placement. Coat form liner with form-release agent.
2. Maintain molds to provide completed precast structural concrete units of shapes, lines, and dimensions indicated, within fabrication tolerances specified.
 - a. Form joints are not permitted on faces exposed to view in the finished work.
 - b. Edge and Corner Treatment: Uniformly chamfered **OR** radiused, **as directed**.

N. Thin-Brick Facings

1. Place form-liner templates accurately to provide grid for thin-brick facings. Provide solid backing and supports to maintain stability of liners while placing thin bricks and during concrete placement.
2. Securely place thin-brick units face down into form-liner pockets and place concrete backing mixture.
3. Completely fill joint cavities between thin-brick units with sand-cement mortar, and place precast concrete backing mixture while sand-cement mortar is still fluid enough to ensure bond.
4. Mix and install pointing grout according to ANSI A108.10. Completely fill joint cavities between thin-brick units with pointing grout, and compress into place without spreading pointing grout onto faces of thin-brick units. Remove excess pointing grout immediately to prevent staining of brick.
 - a. Tool joints to a slightly concave shape **OR** grapevine shape **OR** V-shape, **as directed**, when pointing grout is thumbprint hard.
5. Clean faces and joints of brick facing.

O. Stone Facings

1. Clean stone surfaces before placing in molds to remove soil, stains, and foreign materials. Use cleaning methods and materials recommended by stone supplier.
2. Accurately position stone facings to comply with requirements and in locations indicated on Shop Drawings. Install anchors, supports, and other attachments indicated or necessary to secure stone in place. Keep concrete reinforcement a minimum of **3/4 inch (19 mm)** from the back surface of stone. Use continuous spacers to obtain uniform joints of widths indicated and with edges and faces aligned according to established relationships and indicated tolerances.
 - a. Stone to Precast Anchorages: Provide anchors in numbers, types and locations required to satisfy specified performance criteria, but not less than 2 anchors per stone unit of less than **2 sq. ft. (0.19 sq. m)** in area and 4 anchors per unit of less than **12 sq. ft. (1.1 sq. m)** in area; for units larger than **12 sq. ft. (1.1 sq. m)** in area, provide anchors spaced not more than **24 inches (600 mm)** o.c. horizontally and vertically. Locate anchors a minimum of **6 inches (150 mm)** from stone edge.
3. Fill anchor holes with sealant filler and install anchors **OR** epoxy filler and install anchors with elastomeric anchor sleeve at back surface of stone, **as directed**.
 - a. Install polyethylene sheet to prevent bond between back of stone facing and concrete substrate and to ensure no passage of precast matrix to stone surface.
 - b. Install **1/8-inch (3-mm)** polyethylene-foam bond breaker to prevent bond between back of stone facing and concrete substrate and to ensure no passage of precast matrix to stone surface. Maintain minimum projection requirements of stone anchors into concrete substrate.

P. Fabrication

1. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during precasting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.

- a. Weld-headed studs and deformed bar anchors used for anchorage according to AWS D1.1/D1.1M and AWS C5.4, "Recommended Practices for Stud Welding."
2. Furnish loose hardware items including steel plates, clip angles, seat angles, anchors, dowels, cramps, hangers, and other hardware shapes for securing precast structural concrete units to supporting and adjacent construction.
3. Cast-in reglets, slots, holes, and other accessories in precast structural concrete units as indicated on the Contract Drawings.
4. Cast-in openings larger than **10 inches (250 mm)** in any dimension. Do not drill or cut openings or prestressing strand without the Owner's approval.
5. Reinforcement: Comply with recommendations in PCI MNL 116 for fabricating, placing, and supporting reinforcement.
 - a. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete. When damage to epoxy-coated reinforcement exceeds limits specified, repair with patching material compatible with coating material and epoxy coat bar ends after cutting.
 - b. Accurately position, support, and secure reinforcement against displacement during concrete-placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.
 - c. Place reinforcement to maintain at least **3/4-inch (19-mm)** minimum coverage. Increase cover requirements according to **ACI 318 (ACI 318M)** when units are exposed to corrosive environment or severe exposure conditions. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
 - d. Place reinforcing steel and prestressing strand to maintain at least **3/4-inch (19-mm)** minimum concrete cover. Increase cover requirements for reinforcing steel to **1-1/2 inches (38 mm)** when units are exposed to corrosive environment or severe exposure conditions. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
 - e. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh spacing and wire tie laps, where required by design. Offset laps of adjoining widths to prevent continuous laps in either direction.
6. Reinforce precast structural concrete units to resist handling, transportation, and erection stresses.
7. Prestress tendons for precast structural concrete units by either pretensioning or post-tensioning methods. Comply with PCI MNL 116.
 - a. Delay detensioning or post-tensioning of precast, prestressed structural concrete units until concrete has reached its indicated minimum design release compressive strength as established by test cylinders cured under same conditions as concrete.
 - b. Detension pretensioned tendons either by gradually releasing tensioning jacks or by heat cutting tendons, using a sequence and pattern to prevent shock or unbalanced loading.
 - c. If concrete has been heat cured, detension while concrete is still warm and moist to avoid dimensional changes that may cause cracking or undesirable stresses.
 - d. Protect strand ends and anchorages with bituminous, zinc-rich, or epoxy paint to avoid corrosion and possible rust spots.
 - e. Protect strand ends and anchorages with a minimum of **1-inch- (25-mm-)** thick, nonmetallic, nonshrink, grout mortar and sack rub surface. Coat or spray the inside surfaces of pocket with bonding agent before installing grout.
8. Comply with requirements in PCI MNL 116 and in this Section for measuring, mixing, transporting, and placing concrete. After concrete batching, no additional water may be added.
9. Place face mixture to a minimum thickness after consolidation of the greater of **1 inch (25 mm)** or 1.5 times the maximum aggregate size, but not less than the minimum reinforcing cover specified.
10. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units.
 - a. Place backup concrete mixture to ensure bond with face-mixture concrete.

11. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items, and minimize pour lines, honeycombing, or entrapped air on surfaces. Use equipment and procedures complying with PCI MNL 116.
 - a. Place self-consolidating concrete without vibration according to PCI TR-6, "Interim Guidelines for the Use of Self-Consolidating Concrete in Precast/Prestressed Concrete Institute Member Plants."
12. Comply with ACI 306.1 procedures for cold-weather concrete placement.
13. Comply with PCI MNL 116 procedures for hot-weather concrete placement.
14. Identify pickup points of precast structural concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or permanently mark casting date on each precast structural concrete unit on a surface that will not show in finished structure.
15. Cure concrete, according to requirements in PCI MNL 116, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture. Cure units until compressive strength is high enough to ensure that stripping does not have an effect on performance or appearance of final product.
16. Discard and replace precast structural concrete units that do not comply with requirements, including structural, manufacturing tolerance, and appearance, unless repairs meet requirements in PCI MNL 116 and meet the Owner's approval.

Q. Casting Insulated Wall Panels

1. Cast and screed wythe supported by mold.
2. Place insulation boards abutting edges and ends of adjacent boards. Insert wythe connectors through insulation, and consolidate concrete around connectors according to connector manufacturer's written instructions.
3. Cast and screed top wythe to meet required finish.

R. Fabrication Tolerances

1. Fabricate precast structural concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished unit complies with PCI MNL 116 product dimension tolerances.
2. Brick-Faced Precast Structural Concrete Units: Restrict the following misalignments to 2 percent of number of bricks in a unit:
 - a. Alignment of Mortar Joints:
 - 1) Jog in Alignment: **1/8 inch (3 mm)**.
 - 2) Alignment with Panel Centerline: Plus or minus **1/8 inch (3 mm)**.
 - b. Variation in Width of Exposed Mortar Joints: Plus or minus **1/8 inch (3 mm)**.
 - c. Tipping of Individual Bricks from the Panel Plane of Exposed Brick Surface: Plus **1/16 inch (1.6 mm)**; minus **1/4 inch (6 mm)** less than or equal to depth of form-liner joint.
 - d. Exposed Brick Surface Parallel to Primary Control Surface of Panel: Plus **1/4 inch (6 mm)**; minus **1/8 inch (3 mm)**.
 - e. Individual Brick Step in Face from Panel Plane of Exposed Brick Surface: Plus **1/16 inch (1.6 mm)**; minus **1/4 inch (6 mm)** less than or equal to depth of form-liner joint.
3. Stone Veneer-Faced Precast Structural Concrete Units:
 - a. Variation in Cross-Sectional Dimensions: For thickness of walls from dimensions indicated: Plus or minus **1/4 inch (6 mm)**.
 - b. Variation in Joint Width: **1/8 inch in 36 inches (3 mm in 900 mm)** or a quarter of nominal joint width, whichever is less.
 - c. Variation in Plane between Adjacent Stone Units (Lipping): **1/16-inch (1.6-mm)** difference between planes of adjacent units.

S. Commercial Finishes

1. Commercial Grade: Remove fins and large protrusions and fill large holes. Rub or grind ragged edges. Faces must have true, well-defined surfaces. Air holes, water marks, and color variations are permitted. Limit form joint offsets to **3/16 inch (5 mm)**.

2. Standard Grade: Normal plant-run finish produced in molds that impart a smooth finish to concrete. Surface holes smaller than **1/2 inch (13 mm)** caused by air bubbles, normal color variations, form joint marks, and minor chips and spalls are permitted. Fill air holes greater than **1/4 inch (6 mm)** in width that occur more than once per **2 sq. in (1300 sq. mm)**. Major or unsightly imperfections, honeycombs, or structural defects are not permitted. Limit joint offsets to **1/8 inch (3 mm)**.
3. Grade B Finish: Fill air pockets and holes larger than **1/4 inch (6 mm)** in diameter with sand-cement paste matching color of adjacent surfaces. Fill air holes greater than **1/8 inch (3 mm)** in width that occur more than once per **2 sq. in. (1300 sq. mm)**. Grind smooth form offsets or fins larger than **1/8 inch (3 mm)**. Repair surface blemishes due to holes or dents in molds. Discoloration at form joints is permitted.
4. Grade A Finish: Fill surface blemishes with the exception of air holes **1/16 inch (1.6 mm)** in width or smaller, and form marks where the surface deviation is less than **1/16 inch (1.6 mm)**. Float apply a neat cement-paste coating to exposed surfaces. Rub dried paste coat with burlap to remove loose particles. Discoloration at form joints is permitted. Grind smooth all form joints.
5. Screed or float finish unformed surfaces. Strike off and consolidate concrete with vibrating screeds to a uniform finish. Hand screed at projections. Normal color variations, minor indentations, minor chips, and spalls are permitted. Major imperfections, honeycombing, or defects are not permitted.
6. Smooth, steel trowel finish unformed surfaces. Consolidate concrete, bring to proper level with straightedge, float, and trowel to a smooth, uniform finish.
7. Apply roughened surface finish according to **ACI 318 (ACI 318M)** to precast concrete units that will receive concrete topping after installation.

T. Commercial Architectural Finishes

1. Manufacture member faces free of joint marks, grain, and other obvious defects with corners, including false joints, uniform, straight, and sharp. Finish exposed-face surfaces of precast concrete units to match approved design reference sample **OR** sample panels, **as directed**, and as follows:
 - a. PCI's "Architectural Precast Concrete - Color and Texture Selection Guide," of plate numbers indicated.
 - b. Smooth-Surface Finish: Provide surfaces free of excessive air voids, sand streaks, and honeycombs, with uniform color and texture.
 - c. Textured-Surface Finish: Impart by form liners or inserts to provide surfaces free of pockets, streaks, and honeycombs, with uniform color and texture.
 - d. Bushhammer Finish: Use power or hand tools to remove matrix and fracture coarse aggregates.
 - e. Exposed-Aggregate Finish: Use chemical-retarding agents applied to concrete molds and washing and brushing procedures to expose aggregate and surrounding matrix surfaces after form removal.
 - f. Abrasive-Blast Finish: Use abrasive grit, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.
 - g. Acid-Etched Finish: Use acid and hot-water solution, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces. Protect hardware, connections, and insulation from acid attack.
 - h. Honed Finish: Use continuous mechanical abrasion with fine grit, followed by filling and rubbing procedures.
 - i. Polished Finish: Use continuous mechanical abrasion with fine grit, followed by filling and rubbing procedures.
 - j. Sand-Embedment Finish: Use selected stones placed in a sand bed in bottom of mold, with sand removed after curing.

U. Source Quality Control

1. Testing: Test and inspect precast structural concrete according to PCI MNL 116 requirements.
 - a. Test and inspect self-consolidating concrete according to PCI TR-6.

2. Strength of precast structural concrete units will be considered deficient if units fail to comply with **ACI 318 (ACI 318M)** requirements for concrete strength.
3. If there is evidence that strength of precast concrete units may be deficient or may not comply with **ACI 318 (ACI 318M)** requirements, employ a qualified testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C 42/C 42M.
 - a. A minimum of three representative cores will be taken from units of suspect strength, from locations directed by the Owner.
 - b. Cores will be tested in an air-dry condition or, if units will be wet under service conditions, test cores after immersion in water in a wet condition.
 - c. Strength of concrete for each series of 3 cores will be considered satisfactory if average compressive strength is equal to at least 85 percent of 28-day design compressive strength and no single core is less than 75 percent of 28-day design compressive strength.
 - d. Test results will be made in writing on same day that tests are performed, with copies to the Owner, Contractor, and precast concrete fabricator. Test reports will include the following:
 - 1) Project identification name and number.
 - 2) Date when tests were performed.
 - 3) Name of precast concrete fabricator.
 - 4) Name of concrete testing agency.
 - 5) Identification letter, name, and type of precast concrete unit(s) represented by core tests; design compressive strength; type of break; compressive strength at breaks, corrected for length-diameter ratio; and direction of applied load to core in relation to horizontal plane of concrete as placed.
4. Patching: If core test results are satisfactory and precast structural concrete units comply with requirements, clean and dampen core holes and solidly fill with same precast concrete mixture that has no coarse aggregate, and finish to match adjacent precast concrete surfaces.
5. Defective Units: Discard and replace precast structural concrete units that do not comply with requirements, including strength, manufacturing tolerances, and color and texture range. Chipped, spalled, or cracked units may be repaired, subject to the Owner's approval. the Owner reserves the right to reject precast units that do not match approved samples and sample panels.

1.3 EXECUTION

A. Installation

1. Install clips, hangers, bearing pads, and other accessories required for connecting precast structural concrete units to supporting members and backup materials.
2. Erect precast structural concrete level, plumb, and square within specified allowable tolerances. Provide temporary structural framing, supports, and bracing as required to maintain position, stability, and alignment of units until permanent connection.
 - a. Install temporary steel or plastic spacing shims or bearing pads as precast structural concrete units are being erected. Tack weld steel shims to each other to prevent shims from separating.
 - b. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.
 - c. Remove projecting lifting devices and grout fill voids within recessed lifting devices flush with surface of adjacent precast surfaces when recess is exposed.
 - d. For hollow-core slab voids used as electrical raceways or mechanical ducts, align voids between units and tape butt joint at end of slabs.
3. Connect precast structural concrete units in position by bolting, welding, grouting, or as otherwise indicated on Shop Drawings. Remove temporary shims, wedges, and spacers as soon as practical after connecting and grouting are completed.
 - a. Do not permit connections to disrupt continuity of roof flashing.
4. Field cutting of precast units is not permitted without approval of the the Owner.

5. Fasteners: Do not use drilled or powder-actuated fasteners for attaching accessory items to precast, prestressed concrete units.
 6. Welding: Comply with applicable AWS D1.1/D1.1M and AWS D1.4 for welding, welding electrodes, appearance, quality of welds, and methods used in correcting welding work.
 - a. Protect precast structural concrete units and bearing pads from damage by field welding or cutting operations, and provide noncombustible shields as required.
 - b. Clean weld-affected steel surfaces with chipping hammer followed by brushing, and apply a minimum **4.0-mil- (0.1-mm-)** thick coat of galvanized repair paint to galvanized surfaces according to ASTM A 780.
 - c. Clean weld-affected steel surfaces with chipping hammer followed by brushing, and reprime damaged painted surfaces.
 - d. Remove, reweld, or repair incomplete and defective welds.
 7. At bolted connections, use lock washers, tack welding, or other approved means to prevent loosening of nuts after final adjustment.
 - a. Where slotted connections are used, verify bolt position and tightness. For sliding connections, properly secure bolt but allow bolt to move within connection slot. For friction connections, apply specified bolt torque and check 25 percent of bolts at random by calibrated torque wrench.
 8. Grouting: Grout connections and joints and open spaces at keyways, connections, and joints where required or indicated on Shop Drawings. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are completely filled.
 - a. Place grout to finish smooth, level, and plumb with adjacent concrete surfaces.
 - b. Fill joints completely without seepage to other surfaces.
 - c. Trowel top of grout joints on roofs smooth and uniform. Finish transitions between different surface levels not steeper than 1 to 12.
 - d. Place grout end cap or dam in voids at ends of hollow-core slabs.
 - e. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.
 - f. Keep grouted joints damp for not less than 24 hours after initial set.
- B. Erection Tolerances
1. Erect precast structural concrete units level, plumb, square, true, and in alignment without exceeding the noncumulative erection tolerances of PCI MNL 135.
 2. Minimize variations between adjacent slab members by jacking, loading, or other method recommended by fabricator and approved by the Owner.
- C. Field Quality Control
1. Special Inspections: Engage a qualified special inspector to perform the following special inspections:
 - a. Erection of precast structural concrete members.
 2. Testing Agency: Engage a qualified testing agency to perform tests and inspections.
 3. Field welds will be visually inspected and nondestructive tested according to ASTM E 165 or ASTM E 709. High-strength bolted connections will be subject to inspections.
 4. Testing agency will report test results promptly and in writing to Contractor and the Owner.
 5. Repair or remove and replace work where tests and inspections indicate that it does not comply with specified requirements.
 6. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
 7. Prepare test and inspection reports.
- D. Repairs
1. Repair precast structural concrete units if permitted by the Owner.
 - a. Repairs may be permitted if structural adequacy, serviceability, durability, and appearance of units has not been impaired.

03 - Concrete

2. Mix patching materials and repair units so cured patches blend with color, texture, and uniformity of adjacent exposed surfaces and show no apparent line of demarcation between original and repaired work, when viewed in typical daylight illumination from a distance of 20 feet (6 m).
3. Prepare and repair damaged galvanized coatings with galvanizing repair paint according to ASTM A 780.
4. Wire brush, clean, and paint damaged prime-painted components with same type of shop primer.
5. Remove and replace damaged precast structural concrete units that cannot be repaired or when repairs do not comply with requirements as determined by the Owner.

E. Cleaning

1. Clean mortar, plaster, fireproofing, weld slag, and other deleterious material from concrete surfaces and adjacent materials immediately.
2. Clean exposed surfaces of precast concrete units after erection and completion of joint treatment to remove weld marks, other markings, dirt, and stains.
 - a. Perform cleaning procedures, if necessary, according to precast concrete fabricator's written recommendations. Clean soiled precast concrete surfaces with detergent and water, using stiff fiber brushes and sponges, and rinse with clean water. Protect other work from staining or damage due to cleaning operations.
 - b. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes or damage adjacent materials.

END OF SECTION 03 41 16 00

SECTION 03 41 16 00a - PRECAST CONCRETE SLABS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of precast lightweight roof deck concrete channels, concrete planks, and gypsum planks. Products shall be as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

1.2 PRODUCTS

- A. Channel Slabs: Slabs shall be composed of Portland cement and lightweight aggregate with minimum compressive strength 3,750 psi. Legs shall be reinforced with deformed bars; web shall have welded wire fabric reinforcement. Channels shall support a 30 psf live load plus a 20 psf superimposed dead load.
- B. Concrete Planks: Planks shall be composed of Portland cement and lightweight aggregate with a minimum compressive strength of 3,750 psi. Planks shall be reinforced with welded wire fabric. Planks shall support a 30 psf live load plus a 20 psf superimposed dead load.
- C. Gypsum Planks shall conform to ASTM C 956, factory-laminated to 2-inch thickness, 2-foot wide panels. Planks shall be continuously supported along sides.
- D. Subpurlins shall be bulb-ties, ASTM A 440.
- E. Grout shall be lightweight concrete or gypsum concrete.

1.3 EXECUTION

- A. Concrete Channels and Planks shall be securely attached to support steel or concrete by metal clips or other approved attachments; minimum support bearing shall be 4 inches. Open joints between channels or planks shall be filled with lightweight concrete grout. Planks with tongue and groove edges may not require grouting.
- B. Gypsum Planks shall be snugly fit between bulb-tee subpurlins. Subpurlins shall be tack-welded or screw-attached to supporting steel or weld bar cast in supporting concrete. Joints at bulb-tees shall be grouted with gypsum grout.

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 41 23 00 - PRECAST ARCHITECTURAL CONCRETE

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for architectural precast concrete. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Architectural precast concrete cladding and load-bearing units.
 - b. Insulated, architectural precast concrete units.
 - c. Brick-faced, architectural precast concrete units.
 - d. Stone-faced, architectural precast concrete units.

C. Definition

1. Design Reference Sample: Sample of approved architectural precast concrete color, finish and texture, preapproved by the Owner.

D. Performance Requirements

1. Structural Performance: Provide architectural precast concrete units and connections capable of withstanding the following design loads within limits and under conditions indicated:
 - a. Loads: As indicated.

E. Submittals

1. Product Data: For each type of product indicated.
2. Design Mixtures: For each precast concrete mixture. Include compressive strength and water-absorption tests.
3. Shop Drawings: Detail fabrication and installation of architectural precast concrete units. Indicate locations, plans, elevations, dimensions, shapes, and cross sections of each unit. Indicate joints, reveals, and extent and location of each surface finish. Indicate details at building corners.

NOTE: The following paragraph is not required if Architect or Engineer assumes or is required by law to assume design responsibility.

 - a. Comprehensive engineering analysis signed and sealed **OR** certified, **as directed**, by the qualified professional engineer responsible for its preparation. Show governing panel types, connections, and types of reinforcement, including special reinforcement. Indicate location, type, magnitude, and direction of loads imposed on the building structural frame from architectural precast concrete.
4. Samples: For each type of finish indicated on exposed surfaces of architectural precast concrete units, in sets of 3, illustrating full range of finish, color, and texture variations expected; approximately **12 by 12 by 2 inches (300 by 300 by 50 mm)**.
5. Welding certificates.
6. Material Test Reports: For aggregates.
7. Material Certificates: Signed by manufacturers:
8. Field quality-control test and special inspection reports.

F. Quality Assurance

1. Fabricator Qualifications: A firm that assumes responsibility for engineering architectural precast concrete units to comply with performance requirements. This responsibility includes preparation of Shop Drawings and comprehensive engineering analysis by a qualified professional engineer.

- a. Participates in PCI's plant certification program and is designated a PCI-certified plant for Group A, Category A1 - Architectural Cladding and Load Bearing Units or participates in APA's "Plant Certification Program for Production of Architectural Precast Concrete Products" and is designated an APA-certified plant.
2. Design Standards: Comply with **ACI 318 (ACI 318M)** and design recommendations of PCI MNL 120, "PCI Design Handbook - Precast and Prestressed Concrete," applicable to types of architectural precast concrete units indicated.
3. Quality-Control Standard: For manufacturing procedures and testing requirements, quality-control recommendations, and dimensional tolerances for types of units required, comply with PCI MNL 117, "Manual for Quality Control for Plants and Production of Architectural Precast Concrete Products."
4. Welding: Qualify procedures and personnel according to AWS D1.1/D.1.1M, "Structural Welding Code - Steel"; and AWS D1.4, "Structural Welding Code - Reinforcing Steel."
5. Calculated Fire-Test-Response Characteristics: Where indicated, provide architectural precast concrete units whose fire resistance has been calculated according to ACI 216.1/TMS 0216.1, "Standard Method for Determining Fire Resistance of Concrete and Masonry Construction Assemblies," **OR** PCI MNL 124, "Design for Fire Resistance of Precast Prestressed Concrete," **as directed**, and is acceptable to authorities having jurisdiction.
6. Sample Panels: After sample approval and before fabricating architectural precast concrete units, produce a minimum of 2 sample panels approximately **16 sq. ft. (1.5 sq. m)** in area for review by the Owner. Incorporate full-scale details of architectural features, finishes, textures, and transitions in sample panels.

G. Delivery, Storage, And Handling

1. Deliver architectural precast concrete units in such quantities and at such times to limit unloading units temporarily on the ground.
2. Support units during shipment on nonstaining shock-absorbing material.
3. Store units with adequate dunnage and bracing and protect units to prevent contact with soil, to prevent staining, and to prevent cracking, distortion, warping or other physical damage.
4. Place stored units so identification marks are clearly visible, and units can be inspected.
5. Handle and transport units in a position consistent with their shape and design in order to avoid excessive stresses which would cause cracking or damage.
6. Lift and support units only at designated points shown on Shop Drawings.

1.2 PRODUCTS

A. Mold Materials

1. Molds: Rigid, dimensionally stable, non-absorptive material, warp and buckle free, that will provide continuous and true precast concrete surfaces within fabrication tolerances indicated; nonreactive with concrete and suitable for producing required finishes.
 - a. Mold-Release Agent: Commercially produced liquid-release agent that will not bond with, stain or adversely affect precast concrete surfaces and will not impair subsequent surface or joint treatments of precast concrete.
2. Form Liners: Units of face design, texture, arrangement, and configuration indicated **OR** to match those used for precast concrete design reference sample, **as directed**. Furnish with manufacturer's recommended liquid-release agent that will not bond with, stain, or adversely affect precast concrete surfaces and will not impair subsequent surface or joint treatments of precast concrete.
3. Surface Retarder: Chemical set retarder, capable of temporarily delaying final hardening of newly placed concrete mixture to depth of reveal specified.

B. Reinforcing Materials

1. Reinforcing Bars: ASTM A 615/A 615M, **Grade 60 (Grade 420)**, deformed.
2. Low-Alloy-Steel Reinforcing Bars: ASTM A 706/A 706M, deformed.

3. Galvanized Reinforcing Bars: ASTM A 615/A 615M, **Grade 60** (Grade 420) **OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 767/A 767M, Class II zinc coated, hot-dip galvanized, and chromate wash treated after fabrication and bending, **as directed**.
 4. Epoxy-Coated Reinforcing Bars: ASTM A 615/A 615M, **Grade 60** (Grade 420) **OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 775/A 775M or ASTM A 934/A 934M epoxy coated.
 5. Steel Bar Mats: ASTM A 184/A 184M, fabricated from ASTM A 615/A 615M, **Grade 60** (Grade 420) **OR** ASTM A 706/A 706M, **as directed**, deformed bars, assembled with clips.
 6. Plain-Steel Welded Wire Reinforcement: ASTM A 1064, fabricated from as-drawn **OR** galvanized, **as directed**, steel wire into flat sheets.
 7. Deformed-Steel Welded Wire Reinforcement: ASTM A 497/A 497M, flat sheet.
 8. Epoxy-Coated-Steel Wire: ASTM A 884/A 884M, Class A coated, plain **OR** deformed, **as directed**, flat sheet, Type 1 bendable **OR** 2 nonbendable, **as directed**, coating.
 9. Supports: Suspend reinforcement from back of mold or use bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening reinforcing bars and welded wire reinforcement in place according to PCI MNL 117.
- C. Prestressing Tendons
1. Prestressing Strand: ASTM A 416/A 416M, **Grade 270** (Grade 1860), uncoated, 7-wire, low-relaxation strand.
 - a. Coat unbonded post-tensioning strand with corrosion inhibitor passing ASTM D 1743 and sheath with polypropylene tendon sheathing. Include anchorage devices and coupler assemblies.
- D. Concrete Materials
1. Portland Cement: ASTM C 150, Type I or Type III, gray, unless otherwise indicated.
 - a. For surfaces exposed to view in finished structure, mix gray with white cement, of same type, brand, and mill source.
 2. Supplementary Cementitious Materials:
 - a. Fly Ash: ASTM C 618, Class C or F, with maximum loss on ignition of 3 percent.
 - b. Metakaolin Admixture: ASTM C 618, Class N.
 - c. Silica Fume Admixture: ASTM C 1240, with optional chemical and physical requirement.
 - d. Ground Granulated Blast-Furnace Slag: ASTM C 989, Grade 100 or 120.
 3. Normal-Weight Aggregates: Except as modified by PCI MNL 117, ASTM C 33, with coarse aggregates complying with Class 5S. Stockpile fine and coarse aggregates for each type of exposed finish from a single source (pit or quarry) for Project.
 - a. Face-Mixture-Coarse Aggregates: Selected, hard, and durable; free of material that reacts with cement or causes staining; to match selected finish sample.
 - 1) Gradation: Uniformly graded **OR** Gap graded **OR** To match design reference sample, **as directed**.
 - b. Face-Mixture-Fine Aggregates: Selected, natural or manufactured sand of same material as coarse aggregate, unless otherwise approved by the Owner.
 4. Lightweight Aggregates: Except as modified by PCI MNL 117, ASTM C 330, with absorption less than 11 percent.
 5. Coloring Admixture: ASTM C 979, synthetic or natural mineral-oxide pigments or colored water-reducing admixtures, temperature stable, and nonfading.
 6. Water: Potable; free from deleterious material that may affect color stability, setting, or strength of concrete and complying with chemical limits of PCI MNL 117.
 7. Air-Entraining Admixture: ASTM C 260, certified by manufacturer to be compatible with other required admixtures.
 8. Chemical Admixtures: Certified by manufacturer to be compatible with other admixtures and to not contain calcium chloride, or more than 0.15 percent chloride ions or other salts by weight of admixture.
 - a. Water-Reducing Admixtures: ASTM C 494/C 494M, Type A.
 - b. Retarding Admixture: ASTM C 494/C 494M, Type B.
 - c. Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type D.

- d. Water-Reducing and Accelerating Admixture: ASTM C 494/C 494M, Type E.
- e. High-Range, Water-Reducing Admixture: ASTM C 494/C 494M, Type F.
- f. High-Range, Water-Reducing and Retarding Admixture: ASTM C 494/C 494M, Type G.
- g. Plasticizing and Retarding Admixture: ASTM C 1017/C 1017 M.

E. Steel Connection Materials

1. Carbon-Steel Shapes and Plates: ASTM A 36/A 36M.
2. Carbon-Steel-Headed Studs: ASTM A 108, AISI 1018 through AISI 1020, cold finished, AWS D1.1/D1.1M, Type A or B, with arc shields and with minimum mechanical properties of PCI MNL 117, Table 3.2.3.
3. Carbon-Steel Plate: ASTM A 283/A 283M.
4. Malleable Iron Castings: ASTM A 47/A 47M.
5. Carbon-Steel Castings: ASTM A 27/A 27M, **Grade 60-30** (Grade 415-205).
6. High-Strength, Low-Alloy Structural Steel: ASTM A 572/A 572M.
7. Carbon-Steel Structural Tubing: ASTM A 500, Grade B.
8. Wrought Carbon-Steel Bars: ASTM A 675/A 675M, **Grade 65** (Grade 450).
9. Deformed-Steel Wire or Bar Anchors: ASTM A 496 or ASTM A 706/A 706M.
10. Carbon-Steel Bolts and Studs: **ASTM A 307, Grade A** (ASTM F 568M, Property Class 4.6); carbon-steel, hex-head bolts and studs; carbon-steel nuts, **ASTM A 563** (ASTM A 563M); and flat, unhardened steel washers, ASTM F 844.
11. High-Strength Bolts and Nuts: **ASTM A 325** (ASTM A 325M), Type 1, heavy hex steel structural bolts; heavy hex carbon-steel nuts, **ASTM A 563** (ASTM A 563M); and hardened carbon-steel washers, **ASTM F 436** (ASTM F 436M).
12. Zinc-Coated Finish: For exterior steel items, steel in exterior walls, and items indicated for galvanizing, apply zinc coating by hot-dip process according to ASTM A 123/A 123M or ASTM A 153/A 153M **OR** electrodeposition according to ASTM B 633, SC 3, Types 1 and 2, **as directed**.
 - a. For steel shapes, plates, and tubing to be galvanized, limit silicon content of steel to less than 0.03 percent or to between 0.15 and 0.25 percent or limit sum of silicon and 2.5 times phosphorous content to 0.09 percent.
 - b. Galvanizing Repair Paint: High-zinc-dust-content paint with dry film containing not less than 94 percent zinc dust by weight, and complying with DOD-P-21035A or SSPC-Paint 20.
13. Shop-Primed Finish: Prepare surfaces of nongalvanized steel items, except those surfaces to be embedded in concrete, according to requirements in SSPC-SP 3 and shop-apply lead- and chromate-free, rust-inhibitive primer, complying with performance requirements in MPI 79 **OR** SSPC-Paint 25, **as directed**, according to SSPC-PA 1.
14. Welding Electrodes: Comply with AWS standards.

F. Stainless-Steel Connection Materials

1. Stainless-Steel Plate: ASTM A 666, Type 304, of grade suitable for application.
2. Stainless-Steel Bolts and Studs: ASTM F 593, Alloy 304 or 316, hex-head bolts and studs; stainless-steel nuts; and flat, stainless-steel washers.
 - a. Lubricate threaded parts of stainless-steel bolts with an antiseize thread lubricant during assembly.
3. Stainless-Steel-Headed Studs: ASTM A 276, with minimum mechanical properties of PCI MNL 117, Table 3.2.3.

G. Bearing Pads

1. Provide one of the following bearing pads for architectural precast concrete units as recommended by precast fabricator for application:
 - a. Elastomeric Pads: AASHTO M 251, plain, vulcanized, 100 percent polychloroprene (neoprene) elastomer, molded to size or cut from a molded sheet, Type A durometer hardness of 50 to 70, ASTM D 2240, minimum tensile strength **2250 psi** (15.5 MPa), ASTM D 412.

- b. Random-Oriented, Fiber-Reinforced Elastomeric Pads: Preformed, randomly oriented synthetic fibers set in elastomer. Type A durometer hardness of 70 to 90, ASTM D 2240; capable of supporting a compressive stress of **3000 psi (20.7 MPa)** with no cracking, splitting, or delaminating in the internal portions of pad. Test one specimen for every 200 pads used in Project.
 - c. Cotton-Duck-Fabric-Reinforced Elastomeric Pads: Preformed, horizontally layered cotton-duck fabric bonded to an elastomer; Type A durometer hardness of 80 to 100, ASTM D 2240; complying with AASHTO's "AASHTO Load and Resistance Factor Design (LRFD) Bridge Design Specifications, Division II, Section 18.10.2, or with MIL-C-882E.
 - d. Frictionless Pads: Tetrafluoroethylene (Teflon), glass-fiber reinforced, bonded to stainless or mild-steel plate, of type required for in-service stress.
 - e. High-Density Plastic: Multimonomer, nonleaching, plastic strip.
- H. Accessories
- 1. Reglets: Specified in Division 07 Section "Sheet Metal Flashing And Trim".
OR
Reglets: PVC extrusions, **OR** Stainless steel, Type 302 or 304, **OR** Copper, **as directed**, felt or fiber filled, or with face opening of slots covered.
 - 2. Precast Accessories: Provide clips, hangers, plastic or steel shims, and other accessories required to install architectural precast concrete units.
- I. Grout Materials
- 1. Sand-Cement Grout: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144 or ASTM C 404. Mix at ratio of 1 part cement to 2-1/2 parts sand, by volume, with minimum water required for placement and hydration.
 - 2. Nonmetallic, Nonshrink Grout: Premixed, nonmetallic, noncorrosive, nonstaining grout containing selected silica sands, portland cement, shrinkage-compensating agents, plasticizing and water-reducing agents, complying with ASTM C 1107, Grade A for drypack and Grades B and C for flowable grout and of consistency suitable for application within a 30-minute working time.
 - 3. Epoxy-Resin Grout: Two-component, mineral-filled epoxy resin; ASTM C 881/C 881M, of type, grade, and class to suit requirements.
- J. Thin Brick Units And Accessories
- 1. Thin Brick Units: ASTM C 216, Type FBX or ASTM C 1088, Grade Exterior, Type TBX, not less than **1/2 inch (13 mm) OR 3/4 inch (19 mm) OR 1 inch (25 mm)**, **as directed**, thick with a tolerance of plus or minus **1/16 inch (1.6 mm)**, and as follows:
 - a. Face Size: **2-1/4 inches (57 mm)** high by **8 inches (203 mm)** long.
 - b. Face Size: **2-1/4 inches (57 mm)** high by **7-1/2 to 7-5/8 inches (190 to 194 mm)** long.
 - c. Face Size: **2-3/4 to 2-13/16 inches (70 to 71 mm)** high by **7-1/2 to 7-5/8 inches (190 to 194 mm)** long.
 - d. Face Size: **3-1/2 to 3-5/8 inches (89 to 92 mm)** high by **7-1/2 to 7-5/8 inches (190 to 194 mm)** long.
 - e. Face Size: **3-1/2 to 3-5/8 inches (89 to 92 mm)** high by **11-1/2 to 11-5/8 inches (292 to 295 mm)** long.
 - f. Where indicated to "match existing," provide thin brick matching color, texture, and face size of existing adjacent brick work.
 - g. Face Size: 57 mm high by 190 mm long.
 - h. Face Size: 70 mm high by 190 mm long.
 - i. Face Size: 90 mm high by 190 mm long.
 - j. Face Size: 90 mm high by 290 mm long.
 - k. Special Shapes: Include corners, edge corners, and end edge corners.
 - l. Initial Rate of Absorption: Less than **30 g/30 sq. in. (30 g/194 sq. cm)** per minute; ASTM C 67.
 - m. Efflorescence: Tested according to ASTM C 67 and rated "not effloresced."

- n. Surface Coating: Thin brick with colors or textures applied as coatings shall withstand 50 cycles of freezing and thawing; ASTM C 67 with no observable difference in applied finish when viewed from **10 feet (3 m)**.
 - o. Face Color and Texture: Match approved samples **OR** Medium brown, wire cut **OR** Full-range red, sand molded **OR** Gray, velour, **as directed**.
 - p. Back Surface Texture: Scored, combed, wire roughened, ribbed, keybacked, or dovetailed.
2. Sand-Cement Mortar: Portland cement, ASTM C 150, Type I, and clean, natural sand, ASTM C 144. Mix at ratio of 1 part cement to 4 parts sand, by volume, with minimum water required for placement.
3. Latex-Portland Cement Pointing Grout: ANSI A118.6 and as follows:
- a. Dry-grout mixture, factory prepared, of portland cement, graded aggregate, and dry, redispersible, ethylene-vinyl-acetate additive for mixing with water; uniformly colored.
 - b. Commercial portland cement grout, factory prepared, with liquid styrene-butadiene rubber or acrylic-resin latex additive; uniformly colored.
 - c. Colors: As selected by the Owner from manufacturer's full range.
- K. Stone Materials And Accessories
- 1. Stone facing for architectural precast concrete is specified in Division 04 Section "Exterior Stone Cladding".
 - 2. Anchors: Stainless steel, ASTM A 666, Type 304, of temper and diameter required to support loads without exceeding allowable design stresses.
 - a. Fit each anchor leg with neoprene grommet collar of width at least twice the diameter and of length at least five times the diameter of anchor.
 - 3. Sealant Filler: ASTM C 920, low-modulus, multicomponent, nonsag urethane sealant complying with requirements in Division 07 Section "Joint Sealants" and that is nonstaining to stone substrate.
 - 4. Epoxy Filler: ASTM C 881/C 881M, 100 percent solids, sand-filled nonshrinking, nonstaining of type, class, and grade to suit application.
 - a. Elastomeric Anchor Sleeve: **1/2 inch (13 mm)** long, Type A durometer hardness of 60, ASTM D 2240.
 - 5. Bond Breaker: Preformed, compressible, resilient, nonstaining, nonwaxing, closed-cell polyethylene foam pad, nonabsorbent to liquid and gas, **1/8 inch (3.2 mm)** thick **OR** Polyethylene sheet, ASTM D 4397, **6 to 10 mils (0.15 to 0.25 mm)** thick, **as directed**.
- L. Insulated Panel Accessories
- 1. Molded-Polystyrene Board Insulation: ASTM C 578, Type I, **0.90 lb/cu. ft. (15 kg/cu. m)** **OR** VIII, **1.15 lb/cu. ft. (18 kg/cu. m)** **OR** II, **1.35 lb/cu. ft. (22 kg/cu. m)**, **as directed**; square **OR** ship-lap, **as directed**, edges; with R-value and thickness as required to meet Project requirements.
 - 2. Extruded-Polystyrene Board Insulation: ASTM C 578, Type IV, **1.60 lb/cu. ft. (26 kg/cu. m)** **OR** X, **1.30 lb/cu. ft. (21 kg/cu. m)** **OR** VI, **1.80 lb/cu. ft. (29 kg/cu. m)**, **as directed**; square **OR** ship-lap, **as directed**, edges; with R-value and thickness as required to meet Project requirements.
 - 3. Polyisocyanurate Board Insulation: ASTM C 591, Type I, **1.8 lb/cu. ft. (29 kg/cu. m)** **OR** IV, **2 lb/cu. ft. (32 kg/cu. m)** **OR** II, **2.5 lb/cu. ft. (40 kg/cu. m)**, **as directed**, unfaced, with R-value and thickness as required to meet Project requirements.
 - 4. Wythe Connectors: Glass-fiber and vinyl-ester polymer connectors **OR** Polypropylene pin connectors **OR** Stainless-steel pin connectors **OR** Bent galvanized reinforcing bars or galvanized welded wire trusses **OR** Cylindrical metal sleeve anchors, **as directed**, manufactured to connect wythes of precast concrete panels.
- M. Concrete Mixtures
- 1. Prepare design mixtures for each type of precast concrete required.
 - a. Limit use of fly ash and silica fume to 20 percent of portland cement by weight; limit metakaolin and silica fume to 10 percent of portland cement by weight.

2. Design mixtures may be prepared by a qualified independent testing agency or by qualified precast plant personnel at architectural precast concrete fabricator's option.
3. Limit water-soluble chloride ions to maximum percentage by weight of cement permitted by **ACI 318 (ACI 318M)** or PCI MNL 117 when tested according to ASTM C 1218/C 1218M.
4. Normal-Weight Concrete Mixtures: Proportion mixtures by either laboratory trial batch or field test data methods according to ACI 211.1, with materials to be used on Project, to provide normal-weight concrete with the following properties:
 - a. Compressive Strength (28 Days): **5000 psi (34.5 MPa)** minimum.
 - b. Maximum Water-Cementitious Materials Ratio: 0.45.
5. Water Absorption: 6 percent by weight or 14 percent by volume, tested according to PCI MNL 117.
6. Lightweight Concrete Backup Mixtures: Proportion mixtures by either laboratory trial batch or field test data methods according to ACI 211.2, with materials to be used on Project, to provide lightweight concrete with the following properties:
 - a. Compressive Strength (28 Days): **5000 psi (34.5 MPa)**.
 - b. Unit Weight: Calculated equilibrium unit weight of **115 lb/cu. ft. (1842 kg/cu. m)**, plus or minus **3 lb/cu. ft. (48 kg/cu. m)**, according to ASTM C 567.
7. Add air-entraining admixture at manufacturer's prescribed rate to result in concrete at point of placement having an air content complying with PCI MNL 117.
8. When included in design mixtures, add other admixtures to concrete mixtures according to manufacturer's written instructions.

N. Mold Fabrication

1. Molds: Accurately construct molds, mortar tight, of sufficient strength to withstand pressures due to concrete-placement operations and temperature changes and for prestressing and detensioning operations. Coat contact surfaces of molds with release agent before reinforcement is placed. Avoid contamination of reinforcement and prestressing tendons by release agent.
 - a. Place form liners accurately to provide finished surface texture indicated. Provide solid backing and supports to maintain stability of liners during concrete placement. Coat form liner with form-release agent.
2. Maintain molds to provide completed architectural precast concrete units of shapes, lines, and dimensions indicated, within fabrication tolerances specified.
 - a. Form joints are not permitted on faces exposed to view in the finished work.
 - b. Edge and Corner Treatment: Uniformly chamfered **OR** radiused, **as directed**.

O. Thin Brick Facings

NOTE: The following 2 paragraphs are not applicable if bonding back of thin brick directly to concrete instead of using mortar.

1. Place form liner templates accurately to provide grid for thin brick facings. Provide solid backing and supports to maintain stability of liners while placing thin bricks and during concrete placement.
2. Securely place thin brick units face down into form liner pockets and place concrete backing mixture.
3. Completely fill joint cavities between thin brick units with sand-cement mortar, and place precast concrete backing mixture while sand-cement mortar is still fluid enough to ensure bond.
4. Mix and install grout according to ANSI A108.10. Completely fill joint cavities between thin brick units with grout, and compress into place without spreading grout onto faces of thin brick units. Remove excess grout immediately to prevent staining of brick.
 - a. Tool joints to a slightly concave **OR** grapevine **OR** V-, **as directed**, shape when pointing grout is thumbprint hard.
5. Clean faces and joints of brick facing.

P. Stone Facings

1. Accurately position stone facings to comply with requirements and in locations indicated on Shop Drawings. Install anchors, supports, and other attachments indicated or necessary to secure

stone in place. Keep concrete reinforcement a minimum of **3/4 inch (19 mm)** from the back surface of stone. Use continuous spacers to obtain uniform joints of widths indicated and with edges and faces aligned according to established relationships and indicated tolerances.

- a. Stone to Precast Anchorages: Provide anchors in numbers, types and locations required to satisfy specified performance criteria, but not less than 2 anchors per stone unit of less than **2 sq. ft. (0.19 sq. m)** in area and 4 anchors per unit of less than **12 sq. ft. (1.1 sq. m)** in area; for units larger than **12 sq. ft. (1.1 sq. m)** in area, provide anchors spaced not more than **24 inches (600 mm)** o.c. horizontally and vertically. Locate anchors a minimum of **6 inches (150 mm)** from stone edge.
2. Fill anchor holes with sealant filler and install anchors **OR** epoxy filler and install anchors with elastomeric anchor sleeve at back surface of stone, **as directed**.
 - a. Install polyethylene sheet to prevent bond between back of stone facing and concrete substrate and to ensure no passage of precast matrix to stone surface.
OR
Install **1/8-inch (3-mm)** polyethylene-foam bond breaker to prevent bond between back of stone facing and concrete substrate and to ensure no passage of precast matrix to stone surface. Maintain minimum projection requirements of stone anchors into concrete substrate.

Q. Fabrication

1. Cast-in Anchors, Inserts, Plates, Angles, and Other Anchorage Hardware: Fabricate anchorage hardware with sufficient anchorage and embedment to comply with design requirements. Accurately position for attachment of loose hardware, and secure in place during precasting operations. Locate anchorage hardware where it does not affect position of main reinforcement or concrete placement.
 - a. Weld-headed studs and deformed bar anchors used for anchorage according to AWS D1.1/D1.1M and AWS C5.4, "Recommended Practices for Stud Welding."
2. Furnish loose hardware items including steel plates, clip angles, seat angles, anchors, dowels, cramps, hangers, and other hardware shapes for securing architectural precast concrete units to supporting and adjacent construction.
3. Cast-in reglets, slots, holes, and other accessories in architectural precast concrete units as indicated on the Contract Drawings.
4. Cast-in openings larger than **10 inches (250 mm)** in any dimension. Do not drill or cut openings or prestressing strand without the Owner's approval.
5. Reinforcement: Comply with recommendations in PCI MNL 117 for fabricating, placing, and supporting reinforcement.
 - a. Clean reinforcement of loose rust and mill scale, earth, and other materials that reduce or destroy the bond with concrete. When damage to epoxy-coated reinforcing exceeds limits specified in ASTM A 775/A 775M, repair with patching material compatible with coating material and epoxy coat bar ends after cutting.
 - b. Accurately position, support, and secure reinforcement against displacement during concrete-placement and consolidation operations. Completely conceal support devices to prevent exposure on finished surfaces.
 - c. Place reinforcement to maintain at least **3/4-inch (19-mm)** minimum coverage. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
 - d. Place reinforcing steel and prestressing strand to maintain at least **3/4-inch (19-mm)** minimum concrete cover. Increase cover requirements for reinforcing steel to **1-1/2 inches (38 mm)** when units are exposed to corrosive environment or severe exposure conditions. Arrange, space, and securely tie bars and bar supports to hold reinforcement in position while placing concrete. Direct wire tie ends away from finished, exposed concrete surfaces.
 - e. Install welded wire fabric in lengths as long as practicable. Lap adjoining pieces at least one full mesh spacing and wire tie laps, where required by design. Offset laps of adjoining widths to prevent continuous laps in either direction.

6. Reinforce architectural precast concrete units to resist handling, transportation, and erection stresses.
 7. Prestress tendons for architectural precast concrete units by either pretensioning or post-tensioning methods. Comply with PCI MNL 117.
 - a. Delay detensioning or post-tensioning of precast, prestressed architectural concrete units until concrete has reached its indicated minimum design release compressive strength as established by test cylinders cured under same conditions as concrete.
 - b. Detension pretensioned tendons either by gradually releasing tensioning jacks or by heat-cutting tendons, using a sequence and pattern to prevent shock or unbalanced loading.
 - c. If concrete has been heat cured, detension while concrete is still warm and moist to avoid dimensional changes that may cause cracking or undesirable stresses.
 - d. Protect strand ends and anchorages with bituminous, zinc-rich, or epoxy paint to avoid corrosion and possible rust spots.
 8. Comply with requirements in PCI MNL 117 and requirements in this Section for measuring, mixing, transporting, and placing concrete. After concrete batching, no additional water may be added.
 9. Place face mixture to a minimum thickness after consolidation of the greater of 1 inch (25 mm) or 1.5 times the maximum aggregate size, but not less than the minimum reinforcing cover specified.
 10. Place concrete in a continuous operation to prevent seams or planes of weakness from forming in precast concrete units.
 - a. Place backup concrete mixture to ensure bond with face-mixture concrete.
 11. Thoroughly consolidate placed concrete by internal and external vibration without dislocating or damaging reinforcement and built-in items, and minimize pour lines, honeycombing, or entrapped air on surfaces. Use equipment and procedures complying with PCI MNL 117.
 - a. Place self-consolidating concrete without vibration according to PCI TR-6, "Interim Guidelines for the Use of Self-Consolidating Concrete in Precast/Prestressed Concrete Institute Member Plants."
 12. Comply with PCI MNL 117 for hot- and cold-weather concrete placement.
 13. Identify pickup points of architectural precast concrete units and orientation in structure with permanent markings, complying with markings indicated on Shop Drawings. Imprint or permanently mark casting date on each architectural precast concrete unit on a surface that will not show in finished structure.
 14. Cure concrete, according to requirements in PCI MNL 117, by moisture retention without heat or by accelerated heat curing using low-pressure live steam or radiant heat and moisture. Cure units until compressive strength is high enough to ensure that stripping does not have an effect on performance or appearance of final product.
 15. Discard and replace architectural precast concrete units that do not comply with requirements, including structural, manufacturing tolerance, and appearance, unless repairs meet requirements in PCI MNL 117 and the Owner's approval.
- R. Insulated Panel Casting
1. Cast and screed supported wythe over mold.
 2. Place insulation boards abutting edges and ends of adjacent boards. Insert wythe connectors through insulation, and consolidate concrete around connectors according to connector manufacturer's written instructions.
 3. Cast and screed top wythe to meet required finish.
- S. Fabrication Tolerances
1. Fabricate architectural precast concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with PCI MNL 117 product tolerances as well as position tolerances for cast-in items.
OR
Fabricate architectural precast concrete units straight and true to size and shape with exposed edges and corners precise and true so each finished panel complies with the following product tolerances:

- a. Overall Height and Width of Units, Measured at the Face Exposed to View: As follows:
 - 1) 10 feet (3 m) or under, plus or minus 1/8 inch (3 mm).
 - 2) 10 to 20 feet (3 to 6 m), plus 1/8 inch (3 mm), minus 3/16 inch (5 mm).
 - 3) 20 to 40 feet (6 to 12 m), plus or minus 1/4 inch (6 mm).
 - 4) Each additional 10 feet (3 m), plus or minus 1/16 inch (1.5 mm).
- b. Overall Height and Width of Units, Measured at the Face Not Exposed to View: As follows:
 - 1) 10 feet (3 m) or under, plus or minus 1/4 inch (6 mm).
 - 2) 10 to 20 feet (3 to 6 m), plus 1/4 inch (6 mm), minus 3/8 inch (10 mm).
 - 3) 20 to 40 feet (6 to 12 m), plus or minus 3/8 inch (10 mm).
 - 4) Each additional 10 feet (3 m), plus or minus 1/8 inch (3 mm).
- c. Total Thickness or Flange Thickness: Plus 1/4 inch (6 mm), minus 1/8 inch (3 mm).
- d. Rib Thickness: Plus or minus 1/8 inch (3 mm).
- e. Rib to Edge of Flange: Plus or minus 1/8 inch (3 mm).
- f. Distance between Ribs: Plus or minus 1/8 inch (3 mm).
- g. Variation from Square or Designated Skew (Difference in Length of the Two Diagonal Measurements): Plus or minus 1/8 inch per 72 inches (3 mm per 1830 mm) or 1/2 inch (13 mm) total, whichever is greater.
- h. Length and Width of Block-outs and Openings within One Unit: Plus or minus 1/4 inch (6 mm).
- i. Location and Dimension of Block-outs Hidden from View and Used for HVAC and Utility Penetrations: Plus or minus 3/4 inch (19 mm).
- j. Dimensions of Haunches: Plus or minus 1/4 inch (6 mm).
- k. Haunch Bearing Surface Deviation from Specified Plane: Plus or minus 1/8 inch (3 mm).
- l. Difference in Relative Position of Adjacent Haunch Bearing Surfaces from Specified Relative Position: Plus or minus 1/4 inch (6 mm).
- m. Bowing: Plus or minus L/360, maximum 1 inch (25 mm).
- n. Local Smoothness: 1/4 inch per 10 feet (6 mm per 3 m).
- o. Warping: 1/16 inch per 12 inches (1.5 mm per 300 mm) of distance from nearest adjacent corner.
- p. Tipping and Flushness of Plates: Plus or minus 1/4 inch (6 mm).
- q. Dimensions of Architectural Features and Rustications: Plus or minus 1/8 inch (3 mm).
2. Position Tolerances: For cast-in items measured from datum line location, as indicated on Shop Drawings.
 - a. Weld Plates: Plus or minus 1 inch (25 mm).
 - b. Inserts: Plus or minus 1/2 inch (13 mm).
 - c. Handling Devices: Plus or minus 3 inches (75 mm).
 - d. Reinforcing Steel and Welded Wire Fabric: Plus or minus 1/4 inch (6 mm) where position has structural implications or affects concrete cover; otherwise, plus or minus 1/2 inch (13 mm).
 - e. Reinforcing Steel Extending out of Member: Plus or minus 1/2 inch (13 mm) of plan dimensions.
 - f. Tendons: Plus or minus 1/4 inch (6 mm), vertical; plus or minus 1 inch (25 mm), horizontal.
 - g. Location of Rustication Joints: Plus or minus 1/8 inch (3 mm).
 - h. Location of Opening within Panel: Plus or minus 1/4 inch (6 mm).
 - i. Location of Flashing Reglets: Plus or minus 1/4 inch (6 mm).
 - j. Location of Flashing Reglets at Edge of Panel: Plus or minus 1/8 inch (3 mm).
 - k. Reglets for Glazing Gaskets: Plus or minus 1/8 inch (3 mm).
 - l. Electrical Outlets, Hose Bibs: Plus or minus 1/2 inch (13 mm).
 - m. Location of Bearing Surface from End of Member: Plus or minus 1/4 inch (6 mm).
 - n. Allowable Rotation of Plate, Channel Inserts, and Electrical Boxes: 2-degree rotation or 1/4 inch (6 mm) maximum over the full dimension of unit.
 - o. Position of Sleeve: Plus or minus 1/2 inch (13 mm).
 - p. Location of Window Washer Track or Buttons: Plus or minus 1/8 inch (3 mm).

3. Brick-Faced Architectural Precast Concrete Units: Restrict the following misalignments to 2 percent of number of bricks in a unit.
 - a. Alignment of Mortar Joints:
 - 1) Jog in Alignment: **1/8 inch (3 mm)**.
 - 2) Alignment with Panel Centerline: Plus or minus **1/8 inch (3 mm)**.
 - b. Variation in Width of Exposed Mortar Joints: Plus or minus **1/8 inch (3 mm)**.
 - c. Tipping of Individual Bricks from the Panel Plane of Exposed Brick Surface: Plus **1/16 inch (1.5 mm)**; minus **1/4 inch (6 mm)** less than or equal to depth of form liner joint.
 - d. Exposed Brick Surface Parallel to Primary Control Surface of Panel: Plus **1/4 inch (6 mm)**; minus **1/8 inch (3 mm)**.
 - e. Individual Brick Step in Face from Panel Plane of Exposed Brick Surface: Plus **1/16 inch (1.5 mm)**; minus **1/4 inch (6 mm)** less than or equal to depth of form liner joint.
4. Stone Veneer-Faced Architectural Precast Concrete Units (for smooth-finished stone):
 - a. Variation in Cross-Sectional Dimensions: For thickness of walls from dimensions indicated: Plus or minus **1/4 inch (6 mm)**.
 - b. Variation in Joint Width: **1/8 inch in 36 inches (3 mm in 900 mm)** or a quarter of nominal joint width, whichever is less.
 - c. Variation in Plane between Adjacent Stone Units (Lipping): **1/16 inch (1.5 mm)** difference between planes of adjacent units.

T. Finishes

1. Panel faces shall be free of joint marks, grain, and other obvious defects. Corners, including false joints shall be uniform, straight, and sharp. Finish exposed-face surfaces of architectural precast concrete units to match approved design reference sample **OR** sample panels, **as directed**, and as follows:
 - a. PCI's "Architectural Precast Concrete - Color and Texture Selection Guide," of plate numbers indicated.
 - b. As-Cast Surface Finish: Provide surfaces free of pockets, sand streaks, and honeycombs.
 - c. Textured-Surface Finish: Impart by form liners or inserts to provide surfaces free of pockets, streaks, and honeycombs, with uniform color and texture.
 - d. Bushhammer Finish: Use power or hand tools to remove matrix and fracture coarse aggregates.
 - e. Exposed-Aggregate Finish: Use chemical retarding agents applied to concrete forms and washing and brushing procedures to expose aggregate and surrounding matrix surfaces after form removal.
 - f. Abrasive-Blast Finish: Use abrasive grit, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces.
 - g. Acid-Etched Finish: Use acid and hot-water solution, equipment, application techniques, and cleaning procedures to expose aggregate and surrounding matrix surfaces. Protect hardware, connections, and insulation from acid attack.
 - h. Honed Finish: Use continuous mechanical abrasion with fine grit, followed by filling and rubbing procedures.
 - i. Polished Finish: Use continuous mechanical abrasion with fine grit, followed by filling and rubbing procedures.
 - j. Sand-Embedment Finish: Use selected stones placed in a sand bed in bottom of mold, with sand removed after curing.
2. Finish exposed top **OR** bottom, **as directed**, and back, **as directed**, surfaces of architectural precast concrete units to match face-surface finish.
OR
Finish exposed top **OR** bottom, **as directed**, and back, **as directed**, surfaces of architectural precast concrete units by smooth, steel-trowel finish.
3. Finish unexposed surfaces of architectural precast concrete units by float finish.

U. Source Quality Control

1. Quality-Control Testing: Test and inspect precast concrete according to PCI MNL 117 requirements. If using self-consolidating concrete, also test and inspect according to PCI TR-6,

"Interim Guidelines for the Use of Self-Consolidating Concrete in Precast/Prestressed Concrete Institute Member Plants."

2. Strength of precast concrete units will be considered deficient if units fail to comply with **ACI 318 (ACI 318M)** requirements for concrete strength.
3. Testing: If there is evidence that strength of precast concrete units may be deficient or may not comply with **ACI 318 (ACI 318M)** requirements, precaster will employ an independent testing agency to obtain, prepare, and test cores drilled from hardened concrete to determine compressive strength according to ASTM C 42/C 42M.
 - a. A minimum of three representative cores will be taken from units of suspect strength, from locations directed by the Owner.
 - b. Cores will be tested in an air-dry condition.
 - c. Strength of concrete for each series of 3 cores will be considered satisfactory if average compressive strength is equal to at least 85 percent of 28-day design compressive strength and no single core is less than 75 percent of 28-day design compressive strength.
 - d. Test results will be made in writing on same day that tests are performed, with copies to the Owner, Contractor, and precast concrete fabricator. Test reports will include the following:
 - 1) Project identification name and number.
 - 2) Date when tests were performed.
 - 3) Name of precast concrete fabricator.
 - 4) Name of concrete testing agency.
 - 5) Identification letter, name, and type of precast concrete unit(s) represented by core tests; design compressive strength; type of break; compressive strength at breaks, corrected for length-diameter ratio; and direction of applied load to core in relation to horizontal plane of concrete as placed.
4. Patching: If core test results are satisfactory and precast concrete units comply with requirements, clean and dampen core holes and solidly fill with precast concrete mixture that has no coarse aggregate, and finish to match adjacent precast concrete surfaces.

1.3 EXECUTION

A. Installation

1. Install clips, hangers, bearing pads, and other accessories required for connecting architectural precast concrete units to supporting members and backup materials.
2. Erect architectural precast concrete level, plumb, and square within specified allowable tolerances. Provide temporary supports and bracing as required to maintain position, stability, and alignment as units are being permanently connected.
 - a. Install temporary steel or plastic spacing shims or bearing pads as precast concrete units are being erected. Tack weld steel shims to each other to prevent shims from separating.
 - b. Maintain horizontal and vertical joint alignment and uniform joint width as erection progresses.
 - c. Remove projecting lifting devices and grout fill voids within recessed lifting devices flush with surface of adjacent precast surfaces when recess is exposed.
 - d. Unless otherwise indicated, maintain uniform joint widths of **3/4 inch (19 mm)**.
3. Connect architectural precast concrete units in position by bolting, welding, grouting, or as otherwise indicated on Shop Drawings. Remove temporary shims, wedges, and spacers as soon as practical after connecting and grouting are completed.
 - a. Do not permit connections to disrupt continuity of roof flashing.
4. Welding: Comply with applicable AWS D1.1/D1.1M and AWS D1.4 for welding, welding electrodes, appearance, quality of welds, and methods used in correcting welding work.
 - a. Protect architectural precast concrete units and bearing pads from damage by field welding or cutting operations, and provide noncombustible shields as required.
 - b. Welds not specified shall be continuous fillet welds, using no less than the minimum fillet as specified by AWS.

- c. Clean weld-affected metal surfaces with chipping hammer followed by brushing, and apply a minimum **4.0-mil- (0.1-mm-)** thick coat of galvanized repair paint to galvanized surfaces according to ASTM A 780.
OR
Clean weld-affected metal surfaces with chipping hammer followed by brushing, and reprime damaged painted surfaces.
 - d. Remove, reweld, or repair incomplete and defective welds.
 5. At bolted connections, use lock washers, tack welding, or other approved means to prevent loosening of nuts after final adjustment.
 - a. Where slotted connections are used, verify bolt position and tightness. For sliding connections, properly secure bolt but allow bolt to move within connection slot. For friction connections, apply specified bolt torque and check 25 percent of bolts at random by calibrated torque wrench.
 6. Grouting Connections: Grout connections where required or indicated. Retain grout in place until hard enough to support itself. Pack spaces with stiff grout material, tamping until voids are completely filled. Place grout to finish smooth, level, and plumb with adjacent concrete surfaces. Keep grouted joints damp for not less than 24 hours after initial set. Promptly remove grout material from exposed surfaces before it affects finishes or hardens.
- B. Erection Tolerances
1. Erect architectural precast concrete units level, plumb, square, true, and in alignment without exceeding the noncumulative erection tolerances of PCI MNL 117, Appendix I.
- C. Field Quality Control
1. Special Inspections: Engage a qualified special inspector to perform the following special inspections and prepare reports:
 - a. Erection of precast concrete members.
 2. Testing Agency: Engage a qualified testing agency to perform tests and inspections and prepare test reports.
 3. Field welds will be subject to visual inspections and nondestructive testing according to ASTM E 165 or ASTM E 709. High-strength bolted connections will be subject to inspections.
 4. Testing agency will report test results promptly and in writing to Contractor and the Owner.
 5. Repair or remove and replace work where tests and inspections indicate that it does not comply with specified requirements.
 6. Additional testing and inspecting, at Contractor's expense, will be performed to determine compliance of replaced or additional work with specified requirements.
- D. Repairs
1. Repair architectural precast concrete units if permitted by the Owner. the Owner reserves the right to reject repaired units that do not comply with requirements.
 2. Mix patching materials and repair units so cured patches blend with color, texture, and uniformity of adjacent exposed surfaces and show no apparent line of demarcation between original and repaired work, when viewed in typical daylight illumination from a distance of **20 feet (6 m)**.
 3. Prepare and repair damaged galvanized coatings with galvanizing repair paint according to ASTM A 780.
 4. Wire brush, clean, and paint damaged prime-painted components with same type of shop primer.
 5. Remove and replace damaged architectural precast concrete units when repairs do not comply with requirements.
- E. Cleaning
1. Clean surfaces of precast concrete units exposed to view.
 2. Clean mortar, plaster, fireproofing, weld slag, and other deleterious material from concrete surfaces and adjacent materials immediately.
 3. Clean exposed surfaces of precast concrete units after erection and completion of joint treatment to remove weld marks, other markings, dirt, and stains.

- a. Perform cleaning procedures, if necessary, according to precast concrete fabricator's recommendations. Clean soiled precast concrete surfaces with detergent and water, using stiff fiber brushes and sponges, and rinse with clean water. Protect other work from staining or damage due to cleaning operations.
- b. Do not use cleaning materials or processes that could change the appearance of exposed concrete finishes or damage adjacent materials.

03 41 23 00	03 41 16 00	Precast Structural Concrete

THIS PAGE INTENTIONALLY LEFT BLANK

SECTION 03 41 26 00 - UNBONDED POST-TENSIONED CONCRETE

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for unbonded post-tensioned concrete. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Furnishing post-tensioning reinforcement and accessories including non-encapsulated and encapsulated prestressing tendons, pocket formers, support bars, bar chairs, and slab bolsters.
 - b. Installing post-tensioning tendons.
 - c. Performing post-tensioning operations including stressing and finishing tendons.
 - d. Recording tendon elongations and gage pressures.
 - e. Finishing tendon ends and patching stressing pockets.

C. Definitions

1. Strand Tail: Excess strand length extending past the anchorage device.
2. Stressing Blockout: Opening created in the slab to allow access to stressing-end anchorages.
3. Stressing Pocket: Void formed by pocket former at stressing-end anchorage to provide required cover over wedges and strand tail.
4. Wedge Cavity: Cone-shaped hole in anchorage device designed to hold the wedges that anchor the strand.

D. Performance Requirements

1. Structural Performance: Design cast-in-place, post-tensioned concrete reinforcement as indicated in this Section. Show final effective forces, tendon profiles, and nonprestressed reinforcement on design Shop Drawings.
2. Employ professional Engineer, registered in State location as directed by the Owner >, and acceptable to the Owner, to perform design. Sign and seal design Shop Drawings and design calculations submitted to the Owner for review. Prepare and seal drawings and calculations for submittal to authorities having jurisdiction. Comply with design intent, criteria, and requirements of the Contract Documents.
3. Design structure to withstand loads according to governing codes, within limits and under conditions indicated.
4. Average Precompression:
 - a. Minimum Average Slab Precompression: **125 psi (0.86 MPa) OR 200 psi (1.4 MPa), as directed.**
 - b. Maximum Average Slab Precompression: **300 psi (2.1 MPa) OR 500 psi (3.4 MPa), as directed.**
 - c. Minimum Average Precompression in T-, L-, and Rectangular-Beam Cross Sections: **200 psi (1.4 MPa).**
 - d. Minimum Precompression in Slab Section Not Included in T- or L-Beam Section: **100 psi (0.7 MPa).**
 - e. Maximum Precompression in Transfer Girders: **1000 psi (6.9 MPa).** Specify stage-stressing sequence to avoid overstress.
5. Comply with **ACI 318 (ACI 318M)** limits on stresses at transfer of prestress and under service load.
6. Comply with **ACI 318 (ACI 318M)** requirements for minimum bonded reinforcement.
7. Comply with **ACI 318 (ACI 318M)** requirements for concrete cover over reinforcement.

8. Design members such that thickness and concrete cover over reinforcement comply with fire-resistance requirements of authorities having jurisdiction.
9. Design members such that thickness and concrete cover over reinforcement comply with the following fire-resistance requirements:
 - a. Slabs: Two hours.
 - b. Beam: Two hours.
10. Deflection Limits Including Creep and Shrinkage Effects:
 - a. Total Dead Load: $L/600$.
 - b. Total Dead Plus Live Load: $L/360$.
11. Slab Design:
 - a. Minimum Slab Thickness: **5-1/2 inches (140 mm)**.
 - 1) Minimum Thickness if Conduit Is Embedded: **6 inches (150 mm)**.
 - 2) Maximum Span/Depth Ratio: 45.
 - b. Locate closure strips at midspan and adjust tendon forces and profiles accordingly. Calculate moments in spans with closure strips assuming a continuous slab. Provide only nonprestressed reinforcement within closure strips. Design reinforcement in closure strip to carry ultimate moment at midspan.

E. Submittals

1. Product Data: For each type of product indicated.
2. LEED Submittal:
 - a. Product Data for Credit MR 4.1 and Credit MR 4.2, **as directed**: For products having recycled content, documentation indicating percentages by weight of postconsumer and preconsumer recycled content.
 - 1) Include statement indicating costs for each product having recycled content.
3. Shop Drawings: Installation drawings including plans, elevations, sections, details, and notes prepared by or under the supervision of a registered professional engineer detailing tendon layout and installation procedures.
4. Product Certificates:
5. Qualification Data: For Installer, manufacturer, and testing agency.
6. Mill Test Reports: For prestressing strand.
7. Field quality-control test reports.
8. Calibration Certificates: For jacks and gages.
9. Stressing Records: Filled out by testing agency during stressing operation with the following information recorded:
 - a. Name of Project.
 - b. Date of approved installation drawings used for installation and stressing.
 - c. Floor number and concrete placement area.
 - d. Date of stressing operation.
 - e. Weather conditions including temperature and rainfall.
 - f. Name and signature of inspector.
 - g. Name of individual in charge of stressing operation.
 - h. Serial or identification numbers of jack and gage.
 - i. Date of jack-and-gage calibration certificates.
 - j. Gage pressure to achieve required stressing force per supplied calibration chart.
 - k. Tendon identification mark.
 - l. Calculated tendon elongation.
 - m. Actual tendon elongation.
 - n. Actual gage pressure.

F. Quality Assurance

1. Installer Qualifications: A qualified installer whose full-time Project superintendent has successfully completed PTI's Level 1 - Field Fundamentals course or has equivalent verifiable experience and knowledge acceptable to the Owner.

- a. Superintendent must have received training from post-tensioning supplier in the operation of stressing equipment to be used on Project.
 2. Manufacturer Qualifications: Fabricating plant certified by PTI.
 3. Testing Agency Qualifications: An independent agency qualified according to ASTM E 329 for testing indicated, as documented according to ASTM E 548.
 - a. Testing Agency Inspector: Personnel performing field inspections and measuring elongations shall have successfully completed PTI's Level 1 - Field Fundamentals course or shall have equivalent qualifications acceptable to the Owner.
 4. ACI Publications: Comply with ACI 423.6, "Specification for Unbonded Single Strand Tendons," unless otherwise indicated in the Contract Documents.
 5. Preinstallation Conference: Conduct conference at Project site.
- G. Delivery, Storage, And Handling
1. Deliver, store, and handle post-tensioning materials according to PTI's "Field Procedures Manual for Unbonded Single Strand Tendons."
- H. Coordination
1. Attachments and Penetrations:
 - a. Attach permanent fixtures such as curtain-wall systems, handrails, fire-protection equipment, lights, and security devices to the slab using embedded anchors. Drilled anchors are not allowed unless authorized in writing by the Owner.
 - b. Power-driven fasteners are not allowed unless authorized in writing by the Owner.
 - c. Core drilling for sleeves or other penetrations is not allowed unless authorized in writing by the Owner.
 - d. Protect penetrations within **18 inches (460 mm)** of an anchorage with ASTM A 53/A 53M, Schedule 40 steel pipe.

1.2 PRODUCTS

- A. Prestressing Tendons
1. Prestressing Strand: ASTM A 416/A 416M, **Grade 270 (Grade 1860)**, uncoated, 7-wire, low-relaxation, **0.5-inch- (12.7-mm-) OR 0.6-inch- (15.2-mm-), as directed**, diameter strand.
 2. Post-Tensioning Coating: Compound with friction-reducing, moisture-displacing, and corrosion-inhibiting properties specified in ACI 423.6; chemically stable and nonreactive with prestressing steel, nonprestressed reinforcement, sheathing material, and concrete.
 - a. Minimum Coating Weight: **2.5 lb (1.14 kg)** for **0.5-inch- (12.7-mm-)** diameter strand **OR 3 lb (1.36 kg)** for **0.6-inch- (15.2-mm-)** diameter strand, **as directed**, per **100 feet (30 m)** of strand.
 - b. Completely fill annular space between strand and sheathing over entire tendon length with post-tensioning coating.
 3. Tendon Sheathing: Comply with ACI 423.6.
 - a. Minimum Thickness: **0.050 inch (1.25 mm)** for polyethylene or polypropylene with a minimum density of **0.034 lb/cu. in. (0.9 g/cu. cm)**.
 - b. Continuous over the entire length of tendon to provide watertight encapsulation of strand and between anchorages to prevent intrusion of cement paste or loss of coating for a non-encapsulated system.
 4. Anchorage Device and Coupler Assembly: Assembly of strand, wedges, and anchorage device or coupler complying with static and fatigue testing requirements in ACI 423.6 and capable of developing 95 percent of actual breaking strength of strand.
 - a. Anchorage Bearing Stresses: Comply with ACI 423.6 for stresses at transfer load and service load.
 - b. Fixed-End Anchorage Device Assemblies: Plant fabricated with wedges seated at a load of not less than 80 percent and not more than 85 percent of breaking strength of strand.
 5. Encapsulation System: Watertight encapsulation of prestressing strand consisting of the following:

- a. Wedge-Cavity Caps: Attached to anchorages with a positive mechanical connection and completely filled with post-tensioning coating.
 - 1) Caps for Fixed and Stressing-End Anchorages Devices: Designed to provide watertight encapsulation of wedge cavity. Sized to allow required extension of strand past the wedges.
 - a) Attach cap for fixed-end anchorage device in fabricating plant.
 - 2) Caps at Intermediate Anchorages: Open to allow passage of strand.
 - b. Sleeves: Attached to anchorage device with positive mechanical connection; overlapped a minimum of **4 inches (100 mm)** with sheathing and completely filled with post-tensioning coating.
- B. Nonprestressed Steel Bars
1. Recycled Content of Steel Products: Provide products with an average recycled content of steel products so postconsumer recycled content plus one-half of preconsumer recycled content is not less than **25 OR 60, as directed**, percent.
 2. Support Bars, Reinforcing Bars, Hairpins: ASTM A 615/A 615M, **Grade 60 (Grade 420)**, deformed. Minimum support bar size is **1/2 inch (13 mm)**.
 3. Low-Alloy-Steel Support Bars, Reinforcing Bars, Hairpins: ASTM A 706/A 706M, deformed.
 4. Galvanized Support Bars, Reinforcing Bars, Hairpins: ASTM A 615/A 615M, **Grade 60 (Grade 420) OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 767/A 767M, Class I **OR** II, **as directed**, zinc coated after fabrication and bending.
 - a. Zinc Repair Material: ASTM A 780, zinc-based solder, paint containing zinc dust, or sprayed zinc.
 5. Epoxy-Coated Support Bars, Reinforcing Bars, Hairpins: ASTM A 615/A 615M, **Grade 60 (Grade 420) OR** ASTM A 706/A 706M, **as directed**, deformed bars, ASTM A 775/A 775M epoxy coated with less than 2 percent damaged coating in each **12-inch (300-mm)** bar length.
 - a. Epoxy Repair Coating: Liquid, two-part, epoxy repair coating; compatible with epoxy coating on bars and complying with ASTM A 775/A 775M. Repair damaged areas according to ASTM D 3963/D 3963M.
 6. Supports: Bolsters, chairs, spacers, and other devices for spacing, supporting, and fastening tendons and tendon support bars in place. Manufacture bar supports, according to CRSI's "Manual of Standard Practice," from steel wire, plastic, or precast concrete of greater compressive strength than concrete, and as follows:
 - a. For uncoated bars, use all-plastic **OR** CRSI Class 1 plastic-protected **OR** CRSI Class 2 stainless-steel, **as directed**, bar supports.
 - b. For epoxy-coated bars, use CRSI Class 1A epoxy-coated or other dielectric-polymer-coated wire **OR** all-plastic, **as directed**, bar supports.
 - c. For zinc-coated bars, use galvanized wire or dielectric-polymer-coated wire **OR** all-plastic, **as directed**, bar supports.
- C. Accessories
1. Pocket Formers: Capable of completely sealing wedge cavity; sized to provide the required cover over the anchorage and allow access for cutting strand tail.
 2. Anchorage Fasteners: Stainless-steel **OR** Galvanized steel **OR** Uncoated steel, **as directed**, nails, wires, and screws used to attach anchorage devices to formwork.
 3. Sheathing Repair Tape: Elastic, self-adhesive, moistureproof tape with minimum width of **2 inches (50 mm)**, in contrasting color to tendon sheathing; nonreactive with sheathing, coating, or prestressing steel.
- D. Patching Material
1. Patching Material: One component, polymer-modified, premixed patching material containing selected silica aggregates and portland cement, suitable for vertical and overhead application. Do not use material containing chlorides or other chemicals known to be deleterious to prestressing steel or material that is reactive with prestressing steel, anchorage device material, or concrete.

1.3 EXECUTION

A. Formwork

1. Provide formwork for post-tensioned elements as specified in Division 03 Section "Cast-in-place Concrete". Design formwork to support load redistribution that may occur during stressing operation. Ensure that formwork does not restrain elastic shortening, camber, or deflection resulting from application of prestressing force.
2. Do not remove forms supporting post-tensioned elements until tendons have been fully stressed and elongations have been approved by the Owner, unless authorized in writing by the Owner.
3. Do not place concrete in supported floors until tendons on supporting floors have been stressed and elongations have been approved by the Owner, unless authorized in writing by the Owner.

B. Nonprestressed Steel Reinforcement Placement

1. Placement of nonprestressed steel reinforcement is specified in Division 03 Section "Cast-in-place Concrete". Coordinate placement of nonprestressed steel reinforcement with installation of post-tensioning tendons.

C. Tendon Installation

1. Install tendons according to approved installation drawings and procedures stated in PTI's "Field Procedures Manual for Unbonded Single Strand Tendons."
2. Tendon Supports: Provide continuous slab bolsters or bars supported on individual high chairs spaced at a maximum of **42 inches (1070 mm)** o.c. to ensure tendons remain in their designated positions during construction operations and concrete placement.
 - a. Support tendons as required to provide profiles shown on installation drawings. Position supports at high and low points and at intervals not exceeding **48 inches (1220 mm)**. Ensure that tendon profiles between high and low points are smooth parabolic curves.
 - b. Attach tendons to supporting chairs and reinforcement without damaging tendon sheathing.
 - c. Support slab tendons independent of beam reinforcement.
3. Maintain tendon profile within maximum allowable deviations from design profile as follows:
 - a. **1/4 inch (6.3 mm)** for member depth less than or equal to **8 inches (200 mm)**.
 - b. **3/8 inch (10 mm)** for member depth greater than **8 inches (200 mm)** and less than or equal to **24 inches (610 mm)**.
 - c. **1/2 inch (13 mm)** for member depth greater than **24 inches (610 mm)**.
4. Maintain minimum radius of curvature of 480-strand diameters for lateral deviations to avoid openings, ducts, and embedded items. Maintain a minimum of **2 inches (50 mm)** of separation between tendons at locations of curvature.
5. Limit tendon bundles to five tendons. Do not twist or entwine tendons within a bundle. Maintain a minimum distance of **12 inches (300 mm)** between center of adjacent bundles.
6. If tendon locations conflict with nonprestressed reinforcement or embedded items, tendon placement governs unless changes are authorized in writing by the Owner. Obtain the Owner's approval before relocating tendons or tendon anchorages that interfere with one another.
7. Deviations in horizontal spacing and location of slab tendons are permitted when required to avoid openings and inserts.
8. Installation of Anchorage Devices:
 - a. Place anchorage devices at locations shown on approved installation drawings.
 - b. Do not switch fixed and stressing-end anchorage locations unless authorized in writing by the Owner.
 - c. Attach pocket formers, intermediate anchorage devices, and stressing-end anchorage devices securely to bulkhead forms. Install stressing-end and intermediate anchorage devices perpendicular to tendon axis.
 - d. Install tendons straight, without vertical or horizontal curvature, for a minimum of **12 inches (300 mm)** behind stressing-end and intermediate anchorages.
 - e. Embed intermediate anchorage devices at construction joints in first concrete placed at joint.

- f. Minimum splice length in reinforcing bars at anchorages is **24 inches (600 mm)**. Stagger splices a minimum of **60 inches (1500 mm)**.
 - g. Place fixed-end anchorage devices in formwork at locations shown on installation drawings. Support anchorages firmly to avoid movement during concrete placement.
 - h. Remove loose caps on fixed-end anchorages, refill with post-tensioning coating, and re-attach caps to achieve a watertight enclosure.
9. Maintain minimum concrete cover as follows:
- a. From Exterior Edge of Concrete to Wedge Cavity: **1-1/2 inches (38 mm) OR 2 inches (50 mm), as directed.**
 - b. From Exterior Edge of Concrete to Strand Tail: **3/4 inch (19 mm)**.
 - c. From Exterior Edge of Concrete to Wedge-Cavity Cap: **1 inch (25 mm)**.
 - d. Top, Bottom, and Edge Cover for Anchorage Devices: **3/4 inch (19 mm) OR 1-1/2 inches (38 mm), as directed.**
10. Maintain minimum clearance of **6 inches (150 mm)** between tendons and openings.
11. Prior to concrete placement, mark tendon locations on formwork with spray paint.
12. Do not install sleeves within **36 inches (914 mm)** of anchorages after tendon layout has been inspected unless authorized in writing by the Owner.
13. Do not install conduit, pipe, or embeds requiring movement of tendons after tendon layout has been inspected unless authorized in writing by the Owner.
14. Do not use couplers unless location has been approved by the Owner.
- D. Sheathing Inspection And Repair
1. Inspect sheathing for damage after installing tendons. Repair damaged areas by restoring post-tensioning coating and repairing or replacing tendon sheathing.
 - a. Ensure that sheathing is watertight and there are no air voids.
 - b. Follow tape repair procedures in PTI's "Field Procedures Manual for Unbonded Single Strand Tendons."
 2. Maximum length of exposed strand behind anchorages is as follows:
 - a. Fixed End: **12 inches (300 mm)**.
 - b. Intermediate and Stressing End: **0 inches (0 mm) OR 1 inch (25 mm), as directed.**
 - 1) Cover exposed strand with sheathing repair tape to prevent contact with concrete.
 3. Immediately remove and replace tendons that have damaged strand.
- E. Concrete Placement
1. Do not place concrete until placement of tendons and nonprestressed steel reinforcement has been inspected by special inspector **OR** testing agency, **as directed.**
 2. Provide the Owner and special inspector **OR** testing agency, **as directed**, a minimum of 48 hours' notice before concrete placement.
 3. Place concrete as specified in Division 03 Section "Cast-in-place Concrete". Ensure compaction of concrete around anchorages.
 4. Ensure that position of tendon and nonprestressed steel reinforcement does not change during concrete placement. Reposition tendons and nonprestressed steel reinforcement moved during concrete placement.
 5. Ensure that method of concrete placement does not damage tendon sheathing. Do not support pump lines, chutes, or other concrete placing equipment on tendons.
- F. Tendon Stressing
1. Calibrate stressing jacks and gages at start of job and at least every six months thereafter. Keep copies of calibration certificates for each jack-and-gage pair on Project site and available for inspection. Exercise care in handling stressing equipment to ensure that proper calibration is maintained.
 2. Stress tendons only under supervision of qualified post-tensioning superintendent.
 3. Do not begin stressing operations until concrete strength has reached **3000 psi (20.7 MPa)** as indicated by compression tests of field-cured cylinders.
 4. Complete stressing within 96 hours of concrete placement.

5. If concrete has not reached required strength, obtain the Owner's approval to partially stress tendons and delay final stressing until concrete has reached required strength.
 6. Stage stress transfer girders **OR** foundation mats, **as directed**, according to schedule shown on the Contract Drawings.
 7. If detensioning and restressing of tendon is required, discard wedges used in original stressing and provide new wedges.
 8. Mark and measure elongations according to PTI's "Field Procedures Manual for Unbonded Single Strand Tendons." Measure elongations to closest **1/8 inch (3.2 mm)**.
 9. Submit stressing records within one day of completion of stressing. If discrepancies between measured and calculated elongations exceed plus or minus 7 percent, resolve these discrepancies to satisfaction of the Owner.
 10. Prestressing will be considered acceptable if gage pressures shown on stressing record correspond to required stressing force and calculated and measured elongations agree within 7 percent.
 11. If measured elongations deviate from calculated elongations by more than 7 percent, additional testing, restressing, strengthening, or replacement of affected elements may be required.
- G. Tendon Finishing
1. Do not cut strand tails or cover anchorages until stressing records have been reviewed and approved by the Owner.
 2. Cut strand tails as soon as possible after approval of elongations.
 3. Cut strand tail between **1/2 and 3/4 inch (13 and 19 mm)** from wedges. Do not damage tendon or concrete during removal of strand tail. Acceptable methods of cutting strand tail include the following:
 - a. Oxyacetylene flame.
 - b. Abrasive wheel.
 - c. Hydraulic shears.
 - d. Plasma cutting.
 4. Install caps and sleeves on intermediate anchorages within one day of stressing.
 5. Cut strand tails and install caps on stressing-end anchorages within one day of the Owner's acceptance of elongations.
 6. Patch stressing pockets within one day of cutting strand tail. Clean inside surface of pocket to remove laitance or post-tensioning coating before installing patch material. Finish patch material flush with adjacent concrete.
- H. Field Quality Control
1. Testing Agency: Engage a qualified independent testing and inspecting agency to perform field tests and inspections and prepare test reports. Cooperate with testing agency to facilitate the execution of its duties.
 - a. Before concrete placement, special inspector **OR** testing agency, **as directed**, will inspect the following for compliance with post-tensioning installation drawings and the Contract Documents:
 - 1) Location and number of tendons.
 - 2) Tendon profiles and cover.
 - 3) Installation of backup bars, hairpins, and other nonprestressed reinforcement shown on post-tensioning installation drawings.
 - 4) Installation of pocket formers and anchorage devices.
 - 5) Repair of damaged sheathing.
 - 6) Connections between sheathing and anchorage devices.
 - b. Special inspector **OR** Testing agency, **as directed**, will record tendon elongations during stressing.
 - c. Special inspector **OR** Testing agency, **as directed**, will immediately report deviations from the Contract Documents to the Owner.
- I. Protection

1. Do not expose tendons to electric ground currents, welding sparks, or temperatures that would degrade component.
2. Protect exposed components within one workday of their exposure during installation.
3. Prevent water from entering tendons during installation and stressing.
4. Provide weather protection to stressing-end anchorages if strand tails are not cut within 10 days of stressing the tendons.

J. Repairs

1. Submit repair procedure to the Owner for evaluation and approval.
2. Do not proceed with repairs requiring removal of concrete unless authorized in writing by the Owner.

SECTION 03 51 13 00 - CEMENTITIOUS WOOD FIBER DECKS

1.1 GENERAL

A. Description Of Work

1. This specification covers the furnishing and installation of materials for cementitious wood-fiber deck. Products shall be as follows or as directed by the Owner. Installation procedures shall be in accordance with the product manufacturer's recommendations. Demolition and removal of materials shall be as required to support the work.

B. Summary

1. This Section includes the following:
 - a. Monolithic cementitious wood-fiber units.
 - b. Composite cementitious wood-fiber units.
 - c. Insulated composite cementitious wood-fiber units.
 - d. Subpurlin tees.

C. Submittals

1. Product Data: For each type of product indicated.
2. Shop Drawings: Show fabrication and installation details for cementitious wood-fiber deck. Include details at supports, reinforcement at openings, and attachment to other work.
3. Samples: Show texture, finish, and edge and end configurations of monolithic **OR** composite **OR** insulated composite, **as directed**, cementitious wood-fiber units, **12 inches (305 mm) OR 24 inches (610 mm)**, **as directed**, long by width of unit.
 - a. Include unit with galvanized steel edge channel.

D. Quality Assurance

1. Fire-Test-Response Characteristics: Provide cementitious wood-fiber units that comply with the following requirements:
 - a. Fire-response testing performed by UL, ITS, or another testing and inspecting agency acceptable to authorities having jurisdiction and that performs testing and follow-up services.
 - b. Surface-Burning Characteristics: Maximum flame-spread and smoke-developed indices of 25 and 50, respectively, as determined by testing identical products per ASTM E 84.
 - c. Fire-resistance-rated assemblies indicated by design designations from UL's "Fire Resistance Directory," ITS's "Directory of Listed Products," or the listings of another testing and inspecting agency are identical in materials and construction to those tested per ASTM E 119.
 - d. Products are identified with appropriate markings of applicable testing and inspecting agency.

E. Delivery, Storage, And Handling

1. Protect cementitious wood-fiber units from moisture.
2. Store units on elevated platforms at the Project site in a dry, well-ventilated, covered space and stack according to manufacturer's written recommendations.
3. Handle units to prevent chipping, breaking, cracking, staining, soiling, warping, or other physical damage. Discard damaged units at time of installation.

1.2 PRODUCTS

A. Materials

1. Cementitious Wood-Fiber Units, General: Manufacturer's standard factory-cast structural units complying with the following requirements:

- a. Composition: Chemically processed long wood fibers mixed with Portland cement, ASTM C 150, Type III or magnesium oxysulfate hydraulic cement, pressure bonded to produce units of thicknesses and sizes indicated:
 - b. Properties: As follows, determined according to test method indicated:
 - 1) Noise Reduction Coefficient: NRC 0.55 **OR** 0.60 **OR** 0.65 **OR** 0.70 **OR** 0.75 **OR** 0.80, **as directed**; ASTM C 423.
 - 2) Light Reflectance: 60 percent; ASTM E 1349.
 - c. Finish: Manufacturer's standard natural or prime-painted finish.
2. Oriented-Strand-Board Sheathing: APA-rated sheathing, Exposure 1 complying with DOC PS 2.
 3. Polyisocyanurate-Foam Insulation: 2 lb/cu. ft. (32 kg/cu. m) nominal density, 35 lbf/sq. in. (240 kPa) compressive strength per ASTM D 1621.
 4. Extruded-Polystyrene Insulation: ASTM C 578, Type IV.
 5. Expanded-Polystyrene Insulation: ASTM C 578, Type I.
- B. Monolithic Cementitious Wood-Fiber Units
1. Tile: Manufacturer's standard rabbet-edged, cementitious wood-fiber units.
 2. Plank: Manufacturer's standard tongue-and-groove-edged, cementitious wood-fiber units.
 3. Channel-Reinforced Plank: Manufacturer's standard tongue-and-groove-edged, cementitious wood-fiber planks with factory-installed, cold-formed, 0.0598-inch- (1.52-mm-) thick, galvanized steel channel set in grooved edge.
 4. Concealed-Tee Plank: Manufacturer's standard cementitious wood-fiber units, with edges kerfed, back rabbeted, and beveled.
- C. Composite Cementitious Wood-Fiber Units
1. Composite Tile: Manufacturer's standard factory-laminated composite deck units consisting of a rabbet-edged, cementitious wood-fiber tile base and top layer of oriented-strand-board sheathing, 7/16 inch (11 mm) thick.
 2. Composite Plank: Manufacturer's standard factory-laminated composite deck units consisting of a standard tongue-and-groove-edged, cementitious wood-fiber plank base and top layer of oriented-strand-board sheathing, 7/16 inch (11 mm) thick.
 3. Composite Channel-Reinforced Plank: Manufacturer's standard factory-laminated composite deck units consisting of a standard tongue-and-groove-edged, cementitious wood-fiber plank base with factory-installed, cold-formed, 0.0598-inch- (1.52-mm-) thick, galvanized steel channel set in grooved edge, and top layer of oriented-strand-board sheathing, 7/16 inch (11 mm) thick.
- D. Insulated Composite Cementitious Wood-Fiber Units
